15. The combination with a rotatable roll, of a locking-disk rotatable therewith, a latch coöperating with the locking-disk, a bodily-movable controlling-disk, and connections between the locking and controlling disks for effecting this bodily movement.

16. The combination with a rotatable roll, of a locking-disk rotatable therewith, a latch coöperating with the locking-disk, a pivoted arm, a controlling-disk rotatable upon the arm, and a lever connected with the controlling-disk and movable by the locking-disk.

17. The combination with a rotatable roll, of a locking-disk rotatable therewith and having a cam-shaped periphery, a latch coöperating with the locking-disk, a pivoted arm, a controlling-disk rotatable upon the arm, and a lever connected with the controlling-disk and contacting with the periphery of the locking-disk.

18. The combination with a rotatable roll, of a locking-disk rotatable therewith, a latch coöperating with the locking-disk, a bodily-movable controlling-disk, connections between the locking and controlling disks for effecting this bodily movement, and means for fixing the controlling-disk against bodily movement.

19. A measuring-machine comprising a measuring-roll, a lock for the roll, a rotatable controlling member having a projection for contact with the lock and also having a series of openings, a pin which may be located in one or another of the openings, and a stop member with which the pin contacts.

20. A measuring-machine comprising a measuring-roll, a lock for the roll, a rotatable controlling member having a projection for contact with the lock and also having a series of openings, a pin which may be located in one or another of the openings, a stop member with which the pin contacts, and a spring serving to move the pin toward the stop member.

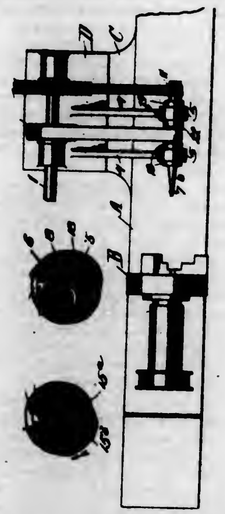
21. A measuring-machine comprising a measuring-roll, a lock for the roll, a rotatable controlling member having a projection for contact with the lock and also having a series of openings, a pin which may be located in one or another of the openings, a stop member with which the pin contacts, a spring serving to move the pin toward the stop member, and gearing for moving the pin in the opposite direction.

22. The combination with a supporting-frame, of a delivery-roll for the material, rolls for operating upon the material, a scale situated adjacent to the operating-rolls, and a second scale mounted upon the frame on the opposite side of the delivery-roll from the first-named scale.

23. The combination with a supporting-frame, of a delivery-roll and a receiving-roll mounted near opposite ends thereof, a pair of cutting-rolls situated adjacent to the delivery-roll, and a measuring-roll located between the cutting-rolls and the receiving-roll.

24. The combination with a supporting-frame, of bearings mounted near opposite ends thereof, a delivery-roll journaled in one set of bearings, a receiving-roll journaled in the other set, a driving member connected with the receiving-roll, means for removably locking said receiving-roll in its bearings, and cutting and measuring rolls situated between the delivery and receiving rolls.

811,839. **BEARING FOR SPINDLES OF GRINDING-MACHINES.** RICHARD R. TOOKE, Providence, R. I., assignor to Iroquois Machine Company, Bedford, N. Y., a Corporation of New York. Filed June 11, 1902. Serial No. 111,221.



Claim.—1. In a device of the class described, a tool-spindle, bearings therefor, means for rotating said spindle, and means for rotating said bearings, said spindle and said bearings both being adapted to rotate upon the same axis of rotation.

2. In a device of the class described, a tool-spindle, a sleeve surrounding said spindle and provided with bearings therefor, and independent means for rotating said spindle and said sleeve upon the same axis of rotation.

3. In a device of the class described, a tool-spindle, a sleeve through which said spindle passes provided with bearings therefor, independent bearings for said sleeve, and means for rotating said sleeve and said bearings independently upon the same axis of rotation as that of said sleeve.

4. In a grinding-machine, in combination, a tool-spindle 6, a bearing-sleeve 8 therefor, additional bearings for said bearing-sleeve 8, and means for rotating said tool-spindle and said bearing-sleeve independently upon a common axis of rotation.

5. In a grinding-machine, in combination, a tool-spindle 6, a sleeve 8 through which said spindle passes and provided with a bearing-surface 10 coöperating with the cone-bearing 9 on one end of said spindle, a pulley 11 mounted to the other end of said spindle and having a bearing on said sleeve 8, independent bearings for said bearing-sleeve, a pulley carried with said bearing-sleeve, and means for driving said pulleys independently.

6. In combination, a tool-spindle 6, a sleeve 8 through which said spindle passes, said spindle being provided with bearing-surfaces coöperating with corresponding bearing-surfaces within said sleeve, a pulley 11 having a bearing upon the end of said sleeve, and means for connecting said pulley to said spindle so that said spindle will be driven thereby and with a provision for lost motion in such connection.

7. In combination, a tool-spindle 6, a sleeve 8 through which said spindle passes, said spindle being provided with bearing-surfaces coöperating with corresponding bearing-surfaces within said sleeve, a pulley 11 upon the outer end of said sleeve, a collar 12 connected to the outer end of said spindle, and the pins 13 projecting from said pulley 11 and fitting loosely in holes in said collar, whereby said spindle is driven from said pulley with a certain amount of lost motion therebetween.

8. In combination, a tool-spindle 6, a sleeve 8 through which said spindle passes, said spindle and sleeve being provided with corresponding bearing-surfaces 9 and 10 at one end thereof, the other end of said spindle being threaded and provided with a bearing 6ª adjustable thereon and coöperating with a suitable bearing-surface within said sleeve, a pulley 11 having a bearing upon the outer end of said sleeve, a collar 12 connected to the outer end of said spindle, connections between said collar and said pulley, and means for driving said pulley.

9. In combination, a tool-spindle 6, a sleeve 8 through which said spindle passes, said spindle and sleeve being provided with corresponding bearing-surfaces 9 and 10 at one end thereof, the other end of said spindle being threaded and provided with a bearing 6ª adjustable thereon and coöperating with a suitable bearing-surface within said sleeve, the pulley 11 having a bearing upon the outer end of said sleeve, the collar 12 connected to said pulley, the pin-and-groove connection between said collar and said bearing 6ª, and the locking and adjusting nut 12ª on the end of said spindle, substantially as and for the purposes set forth.

10. In a device of the class described, a tool-spindle, bearings within which said spindle is freely rotatable, and bearings within which said first-mentioned bearings are freely rotatable said spindle and said first-mentioned bearings being adapted to rotate upon a common axis of rotation.

11. In a device of the class described, a tool-spindle, bearings therefor, and common means for rotating said spindle and said bearings upon the same axis of rotation.

12. In a device of the class described, a tool-spindle, bearings therefor, and common means adapted to rotate said spindle and said bearings at different speeds upon a common axis of rotation.

13. In a device of the class described, a tool-spindle, a sleeve surrounding said spindle and provided with bearings therefor, said spindle being equidistant from the surrounding walls of said sleeve and means adapted to rotate said tool-spindle and said sleeve simultaneously at different rates of speed.

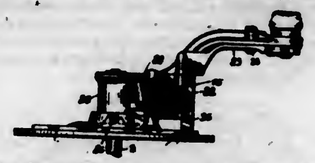
14. In combination, a spindle, concentrically-arranged bearings within which said spindle is mounted, concentrically-arranged bearings within which said first-mentioned bearings are mounted, and means adapted to rotate said spindle and said first-mentioned bearings simultaneously at different rates of speed.

15. In combination, a spindle, a sleeve within which said spindle is freely rotatable, concentrically-arranged bearings within which said sleeve is freely rotatable, and means adapted to rotate said sleeve and said spindle simultaneously in the same direction at different rates of speed.

16. In a grinding-machine, in combination, a tool-spindle, bearings within which said spindle is rotatable, and bearings within which said first-mentioned bearings are freely rotatable, said spindle and said first-mentioned bearings being adapted to be independently rotated and during each rotation to remain in the same relative position with respect to the article to be ground.

811,840. **ATTACHMENT FOR ELECTRIC CONTROLLERS.** FERDINAND VOLK, Pittsburg, Pa. Filed Sept. 12, 1905. Serial No. 278,128.

Claim.—1. In a device of the character described, the combination of a plate, staggered lugs carried on said plate, a controller-shaft, a cap carried on said shaft, an operating-lever mounted upon said cap, a movable plate carried by said shaft, a vertically-movable spring-pressed pawl carried by said plate and adapted to contact with said lugs, a second lever slidably mounted on the operating-lever and provided with a cam-opening, a pin connecting said plate and said second lever, a rotary handle carried by the operating-lever, a lug carried by said handle and operating in said cam-opening to move said plate when the handle is rotated, substantially as described.



2. In a device of the character described, the combination of a plate, lugs carried on said plate and arranged in staggered relation to one another, and a controller-shaft with a movable plate mounted on the shaft and having a pawl adapted to engage said lugs, an operating-lever carried by the shaft, a second lever slidably mounted on the operating-lever and connected to said plate, a rotary handle mounted on said operating-lever, means actuated by said handle to move said plate.

3. In a device of the character described, the combination of a plate, staggered lugs carried by said plate, a controller-shaft, an operating-lever mounted on said shaft, a plate movably mounted on the shaft, a spring-impelled pawl carried by said plate and adapted as the plate is moved on the lever to successively engage said staggered lugs, a rotary handle mounted on the operating-lever, means carried by the handle to move said plate.

4. In a device of the character described, the combination with a controller-shaft, lugs arranged in staggered relation concentric to the shaft, a cap mounted on the shaft, an operating-lever mounted on said cap, a sliding plate mounted on the cap, a rotary handle mounted on the operating-lever, means carried by the handle for moving the plate in opposite directions accordingly as the handle is turned in one direction or the other.

5. In a device of the character described, the combination of a controller-shaft, a plurality of staggered lugs arranged concentrically to the shaft, a cap carried by said shaft, an operating-lever carried by said cap, a rotary handle carried by the operating-lever, engaging means movable concentrically to the shaft and adapted to successively engage said lugs, means actuated by said rotary handle for moving said engaging means in a direction radial to the shaft.

6. The combination of a controller-shaft, a plate, staggered lugs thereon, a cap carried by said shaft, an operating-lever mounted on said shaft, a rotary handle on the operating-lever, a pawl adapted to be moved concentrically on the shaft by the movement of the operating-lever and longitudinally of the operating-lever by the rotary movement of the handle.

7. The combination with a controller-shaft, and an operating-lever, of a cap carried by said shaft and adapted to support said lever, a rotary handle carried by the lever, and means operable by the rotation of the handle for permitting successive limiting movement of the operating-lever.

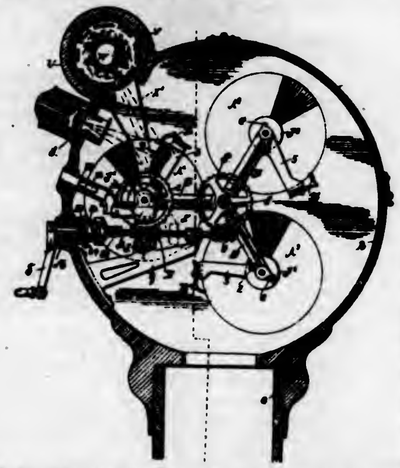
811,841. **MOVING-PICTURE APPARATUS.** ROBERT C. WAGNER, Toledo, Ohio. Filed Dec. 3, 1904. Serial No. 235,239.

Claim.—1. The combination in a mutoscope, of a rotary hub, a series of pictures mounted on said hub, means for rotating the hub, a stationary light arranged to illuminate the pictures carried by the hub, a party-colored cylinder surrounding said light, and means whereby said cylinder will be revolved simultaneously with the revolving of the hub.

2. In a mutoscope, the combination of a case, a spider mounted to revolve in said case, a plurality of hubs journaled in said spider, mutoscopic pictures mounted on said hubs, means for revolving the spider so as to bring the hubs successively to a predetermined point, and means for revolving each hub after it has reached said predetermined point.

3. In a mutoscope, the combination of a case, spiders revolubly mounted in said case, a plurality of hubs mounted in said spiders, means for revolving the spiders to bring the hubs successively to a predetermined position, and within the range of vision, means for stopping the revolution of the spiders when one of said hubs has reached each predetermined position, means for revolving the hub which has reached the aforesaid position, means for automatically releasing the spiders when the hub has made a complete revolution, means for automatically stopping the next-succeeding hub at the position occupied by the hub first thrown into action.

4. In a mutoscope, the combination of a rotary spider, a plurality of mutoscopic hubs mounted on said spider and carrying mutoscopic pictures, a manually-operated shaft, a clutch member carried by said shaft, a shaft operably connected to and adapted to turn said spider, a clutch member carried by the last-mentioned shaft, means carried by said shaft for turning one of the hubs, a solenoid having a core connected to the last-named clutch member, electrical circuits including said solenoid, means for completing said circuit and thereby energizing the solenoid whereby said clutch members will be brought into engagement with one another.



5. In a mutoscope, the combination of a plurality of mutoscopic hubs each furnished with a set of pictures, means for successively bringing the pictures on each hub into sight, and means for revolving each hub when brought into sight so as to successively expose the pictures thereon to view.

6. In a moving-picture apparatus, the combination of a plurality of sets of moving pictures, means for successively bringing each set of pictures into a position to be viewed, and means for operating each set of pictures so as to produce a moving-picture effect.

7. In a moving-picture apparatus, the combination of a plurality of sets of moving pictures, means for successively bringing each set into view, means for illuminating the pictures when brought into view, and means for changing the character of the illumination during the time the pictures are being viewed.

8. In a mutoscope, the combination with a hub of springs projecting from said hub, radially-slotted rings carried by said springs and adapted to receive the edges of picture-mountings.

811,342. OIL-CLOTH-PRINTING MACHINE. WILLIAM H. WALDRON, New Brunswick, N. J. Filed Apr. 10, 1905. Serial No. 254,662.

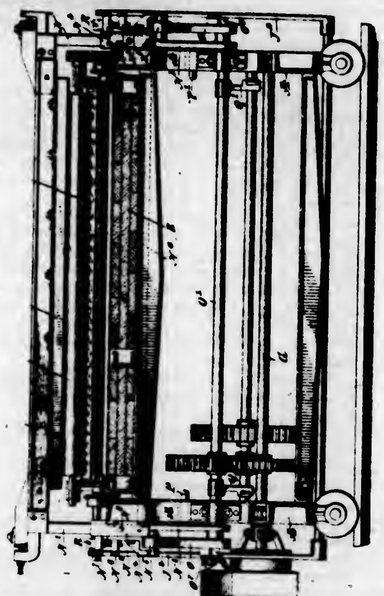
Claim.—1. An oil-cloth-printing machine having a block provided with a printing-face arranged parallel with the surface of the fabric to be printed, means for reciprocating the said block to move the printing-face into contact with the surface of the fabric to make the impression, and means for shifting the block over the fabric and parallel to the surface thereof during the time the block is in contact therewith.

2. An oil-cloth-printing machine having a block provided with a printing-face arranged parallel with the surface of the fabric to be printed, and means for shifting the printing-block parallel with the surface of the fabric during the time the printing-face is in contact therewith.

3. An oil-cloth-printing machine having a block provided with a printing-face arranged parallel with the surface of the fabric to be printed, and means for shifting the printing-block transversely of the fabric and parallel with the surface thereof during the time the printing-face is in contact therewith.

4. An oil-cloth-printing machine having a block provided with a printing-face arranged parallel with the surface of the fabric to be printed, and means for shifting the printing-block across and back over the fabric and parallel therewith during the time the printing-block is in contact with the fabric.

5. An oil-cloth-printing machine having a printing-block, a frame carrying the said printing-block, means for intermittently lowering and raising the said printing-block, guideways for the side arms of the said frame to slide in, the guideways being mounted to rock, and means for imparting a rocking motion to the said guideways in unison with the said means for intermittently lowering and raising the said block.



6. An oil-cloth-printing machine having a printing-block, a frame carrying the said printing-block, means for intermittently lowering and raising the said printing-block, guideways for the side arms of the said frame to slide in, the guideways being mounted to rock, pins mounted to slide and adapted to successively engage the side arms of the said frame, and cam-arms engaging the said pins successively.

7. An oil-cloth-printing machine having a printing-block, a frame carrying the said printing-block, means for intermittently lowering and raising the said printing-block, guideways for the side arms of the said frame to slide in, the guideways being mounted to rock, pins mounted to slide and adapted to successively engage the side arms of the said frame, and cam-arms engaging the said pins successively, the said cam-arms being secured on the operating-shaft of the said lowering and raising means.

8. In an oil-cloth-printing machine and in combination, a support for the fabric, a plurality of blocks arranged transversely of the support and spaced apart from each other, each of the blocks provided with a printing-face arranged parallel to the surface of the support, means for simultaneously moving the blocks into contact with the fabric upon the support, and means to simultaneously shift the blocks transversely of the support and parallel to the surface thereof while in contact with the fabric.

9. In an oil-cloth-printing machine and in combination, a support for the fabric, means for impressing a figure upon the fabric while on the support and comprising a block having a printing-face parallel with the surface of the support, and means for shifting said impressing means transversely of the fabric while in contact therewith.

10. In an oil-cloth-printing machine and in combination, a support for the fabric, means for impressing a figure upon the fabric while on the support and comprising a block provided with a printing-face parallel to the surface of the support, and means for shifting the impressing means as a whole transversely of the support and with the printing-face parallel to the surface thereof while in contact with the fabric.

811,348. HOSE-CLAMP. WARD C. WALKER, Baltimore, Md. Filed July 7, 1905. Serial No. 268,681. (Model.)

Claim.—1 A hose-clamp, formed of a single piece of sheet metal, consisting of a longitudinally-slotted band portion narrowed into a tongue-like extension at its outer end, said extension having a centrally-arranged series of perforations and a double series of teeth formed therein; and a cup-shaped head portion adapted to receive said tongue extension, having a perforation therein through which said band may be engaged, a strap or cross-piece at its forward end and forwardly-projecting tongue-like projections over which said band is arranged when adjusted upon a hose, and a downwardly and rearwardly projecting double pawl.

2. A hose-clamp, formed of a single piece of sheet metal, consisting of a longitudinally-slotted band portion narrowed into a tongue-like extension at its outer end, said extension having a centrally-arranged series of perforations and a double series of teeth formed therein; and a cup-shaped head portion adapted to receive said tongue extension, having a perforation therein through which said band may be engaged, a strap or cross-piece at its forward end over which said band is arranged when adjusted upon a hose, and a downwardly and rearwardly projecting double pawl.

3. A hose-clamp, formed of a single piece of sheet metal, consisting of a longitudinally-slotted band portion narrowed into a tongue-like extension at its outer end, said extension having a centrally-arranged series of perforations and a double series of teeth formed therein; and a cup-shaped head portion adapted to receive said tongue extension, having a perforation therein through which said band may be engaged, and a downwardly and rearwardly projecting double pawl.

4. A hose-clamp, formed of a single piece of sheet metal, consisting of a band portion having a centrally-arranged series of perforations and a double series of teeth formed therein; and a cup-shaped head portion adapted to receive said band, having a perforation therein through which said band may be engaged, a strap or cross-piece at its forward end and forwardly-projecting tongue-like projections, over which said band is arranged when adjusted upon a hose, and a downwardly and rearwardly projecting double pawl.

5. A hose-clamp, formed of a single piece of sheet metal, consisting of a band portion having a centrally-arranged series of perforations and a double series of teeth formed therein; and a cup-shaped head portion adapted to receive said band, having a perforation therein through which said band may be engaged, a strap or cross-piece at its forward end over which said band is arranged when adjusted upon a hose, and a downwardly and rearwardly projecting double pawl.

6. A hose-clamp, formed of a single piece of sheet metal, consisting of a band portion having a centrally-arranged series of perforations and a double series of teeth formed therein; and a cup-shaped head portion adapted to receive said band, having a perforation therein through which said band may be engaged, and a downwardly and rearwardly projecting double pawl.

7. A hose-clamp formed of a single piece of sheet metal, consisting of a band portion having teeth formed therein; and a head portion adapted to receive said band, having an opening therein through which said band may be engaged, a strap or cross-piece at its forward end, and forwardly-projecting tongue-like projections over which said band is arranged when adjusted upon a hose, and a downwardly and rearwardly projecting pawl.

8. A hose-clamp, formed of a single piece of sheet metal, consisting of a band portion having teeth formed therein; and a head portion adapted to receive said band, having an opening therein through which said band may be engaged, a strap or cross-piece at its forward end, over which said band is arranged when adjusted upon a hose, and a downwardly and rearwardly projecting pawl.

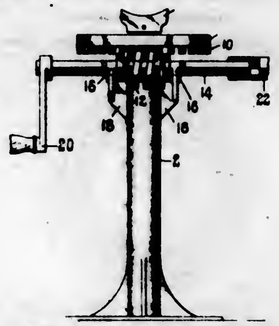
9. A hose-clamp, consisting of a band portion, having a centrally-arranged series of perforations and a double series of teeth formed therein; and a head portion adapted to receive said band, having an opening therein through which said band may be engaged, having a cross-piece at its forward end over which said band is arranged when adjusted upon a hose, and a downwardly and rearwardly projecting double pawl.

10. A hose-clamp, consisting of a band portion having a centrally-arranged series of perforations and a double series of teeth formed therein; and a head portion adapted to receive said band, having an opening therein through which said band may be engaged, and a downwardly and rearwardly projecting double pawl.

11. A hose-clamp, consisting of a band portion having teeth formed therein; and a head portion adapted to receive said band, having an opening therein through which said band may be engaged, having a cross-piece at its forward end over which said band is arranged when adjusted upon a hose, and a downwardly and rearwardly projecting pawl.

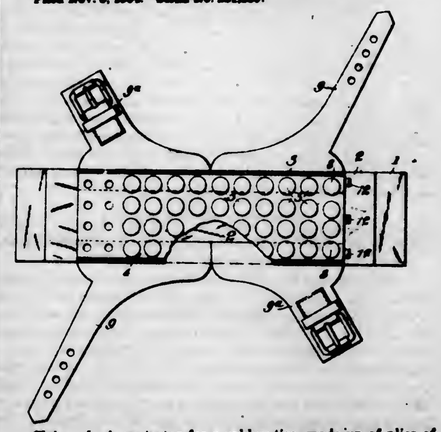
12. A hose-clamp, consisting of a band portion, having a centrally-arranged series of perforations and a double series of teeth therein; and a head portion adapted to receive said band, having an opening therein through which said band may be engaged, and a downwardly and rearwardly projecting double pawl.

811,344. LIFTING DEVICE. JOHN C. WARE, St. Louis, Mo. Filed Oct. 27, 1905. Serial No. 284,748.



Claim.—A lifting device comprising a standard, a screw-shaft loosely mounted in said standard and provided at its upper end with a bearing-block adapted to engage a portion of a vehicle, a gear rotatably mounted on the upper end of said standard and having threads which engage the threads of the screw-shaft, the teeth on said gear comprising a plurality of pins, arms carried by said standard and provided with open bearings, a shaft mounted in said bearings and having a worm connected thereto which engages the teeth on said gear, and a device on said shaft by which it may be rotated for causing the screw-shaft to elevate the vehicle; substantially as described.

811,345. TIRE-PROTECTOR. HARRIS WAXMAN, New York, N. Y. Filed Nov. 3, 1904. Serial No. 231,280.



Claim.—1. A protector for a rubber tire, made up of plies of strong, flexible material and provided at its ends, which are united to form an endless band, with an overlapping metal plate and securing screws and nuts, said protector being provided also with metal rivets having exposed heads, and some of the plies of the material overlapping at the joint where the ends of the protector are joined together.

2. A protector for a rubber tire, composed of sections, said sections each being composed of an inner ply, an outer ply, and an intermediate ply, all of tough, flexible material, the inner and intermediate plies being connected by marginal rows of stitching and the in-

terconnecting and outer plies connected by headed rivets, the said rivets, straps with buckles on the respective edges of the section for securing it to the tire, and means for securing the sections together end to end when in place.

3. A protector for a rubber tire, composed of sections, one for each spoke in the wheel, and each section having two straps at each edge near its end, said straps projecting obliquely from the section and those on the same side diverging.

4. A protector for a rubber tire composed of sections provided with hook-and-eye fastenings for connecting the several sections together detachably, the terminal sections having the joint between them overlapped by a plate secured by screws and nuts, each of said sections being made up of plies of strong flexible material and some of said plies overlapping at the joint.

811,846. **REGULATING-SPRING.** JOSEPH P. WEBER, Pittsburg, Pa. Filed Sept. 21, 1903. Serial No. 174,661.

Claim.—1. A regulating-spring of the form of a logarithmic spiral.

2. A regulating-spring of logarithmic spiral form in which the space between the coils gradually decreases from the outer coil to the innermost coil.

811,847. **INDOOR-GOLF GAME APPARATUS.** MARSHALL WHITLATCH, Westfield, N. J. Filed Nov. 26, 1904. Serial No. 234,127.

Claim.—The combination in an indoor-golf game apparatus, of circular disks divided into sections to indicate the strokes; a smooth block with a spindle upon it, round which these disks are spun and an arrow painted on the block pointing toward the spindle; together with one or more golf-boards, each board containing one of the holes of a golf-course painted upon it; the blocking off of the golf-boards into squares with small holes or perforations made at all of the intersecting points of these squares into which is placed a peg to locate the position of the ball on the links, and means on the board to indicate the disk to be spun, all substantially as set forth.

811,848. **FISHING-TOOL FOR OIL-WELLS.** ADRAN W. WOLF, Ames, W. Va. Filed Sept. 25, 1905. Serial No. 280,045.

Claim.—1. A fishing-tool consisting of a head, a tubular member having an enlarged bore and a series of ratchet-teeth formed in its bottom, a gripping-head having a stem portion fitting into said tubular member, a cap carried by said head and fitting in said tubular member said gripping-head having ratchet-teeth adapted to be engaged by the first-named ratchet-teeth, the lower end of said gripping-head having a recess formed therein, the bottom of said head having ratchet-teeth formed thereon, means to retain said gripping-head in engagement with said tubular member, substantially as described.

2. A fishing-tool for drilling-tools consisting of a head having a contracted portion, a tubular member screwing on the contracted portion of the head, said tubular member having a central bore enlarged at its upper end, a grip-head adapted to engage said drilling-tools, said grip-head being adapted to fit in said tubular member and carrying a removable dog fitting in the enlarged bore of the tubular member, means to retain said gripping-head by suddenly projecting said tubular member upon said head, substantially as described.

811,848.

811,849. **STOVE OR FURNACE.** ARCH W. WOODWARD, Rockford, Ill. Filed Apr. 1, 1904. Serial No. 201,606.

Claim.—1. In a stove or furnace, in combination, a stove-body; a fire-chamber; a fuel-magazine; a coal-supporting plate in said magazine; and a reciprocatory slide supported upon the bottom wall of the fuel-magazine beneath said coal-supporting plate, said slide being provided with ridges on its under side.

2. In a stove or furnace, in combination, a fire-chamber; a fuel-magazine; a gate for partitioning off the fuel-magazine from the fire-chamber, said gate being adapted to close the opening between said chamber and magazine; a feed-slide toward which said gate closes; and means for reciprocating said feed-slide.

3. In a stove or furnace, in combination, a fire-chamber; a fuel-magazine; a curved gate for partitioning off the fuel-magazine from the fire-chamber, said gate being mounted to swing bodily in the arc of a circle; a feed-slide toward which said gate closes; and means for reciprocating said feed-slide.

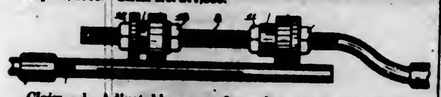
4. In a stove or furnace, in combination, a fire-chamber; a fuel-magazine comprising a storage-chamber and a feeding-chamber; a gate for partitioning off the feeding-chamber from the storage-chamber; a coal-supporting plate in said storage-chamber; and a feed-slide supported beneath said coal-supporting plate.

5. In a stove or furnace, in combination, a fire-chamber; a fuel-magazine comprising a storage-chamber having an inclined bottom and a feeding-chamber; a gate for partitioning off the feeding-chamber from the storage-chamber; an inclined coal-supporting plate in said storage-chamber; and a feed-slide supported on the inclined bottom of said storage-chamber beneath said coal-supporting plate and extending into the feeding-chamber.

6. In a stove or furnace, in combination, a fire-chamber; a fuel-magazine; a movable member in said magazine for preventing clogging; a coal-supporting plate in said magazine; and a feed-slide supported beneath said coal-supporting plate.

7. In a stove or furnace, in combination, a fire-chamber; a fuel-magazine comprising a storage-chamber and a feeding-chamber; a gate for partitioning off the feeding-chamber from the storage-chamber; a scraper-plate in said storage-chamber for preventing clogging; a coal-supporting plate in said storage-chamber; and a feed-slide supported beneath said coal-supporting plate.

811,850. **ADJUSTABLE MEANS FOR RODS, BARS, OR CABLES.** CHARLES H. WISSEY and WILLIAM B. MARSHALL, Clearfield, Pa. Filed Sept. 8, 1905. Serial No. 277,893.



Claim.—1. Adjustable means for rods or bars consisting of a bar, lugs carried by said bar, cups mounted in said lugs, a screw-threaded rod extending through said cups, jam-nuts mounted upon said rod and adapted to lock said rod in engagement with said bar, substantially as described.

2. Adjustable means for rods and bars consisting of a bar, two lugs carried by said bar, a rod extending through both of said lugs, nuts adjustably mounted upon said rod on both sides of both lugs and adapted to lock said rod in engagement with said bar, substantially as described.

3. A device of the character described, consisting of a bar, lugs carried by said bar, cups mounted in said lugs, a rod extending through said cups, means for securing said rod in engagement with said cups, substantially as described.

4. In a device of the character described, the combination with rods of a bar adapted to be fixed to one of said rods, two lugs carried by said bar, a third rod extending through both of said lugs, and means to secure the end of said third rod in engagement with both of said lugs, substantially as described.

5. In a device of the character described, the combination with rods, of a bar adapted to be secured to one of said rods, a curved rod adapted to be secured to the other of said rods, lugs carried by said bar and adapted to receive the end of said curved rod, means for adjustably securing the ends of said rod in said lugs, substantially as described.

811,851. **KNIFE FOR AUGER-BITS.** ELSIE A. WYCKOFF, Stamford, Conn., administratrix of Frank T. Wyckoff, deceased, assignor to The Wyckoff Pipe and Creosoting Company, Stamford, Conn., a Corporation. Filed Apr. 28, 1905. Serial No. 257,999.

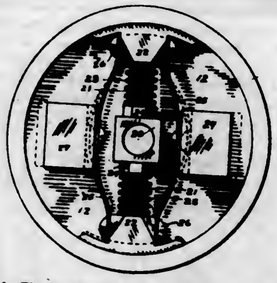
Claim.—1. An auger-bit comprising a removable cutter or bit proper, having circular or arcuate lateral edge portions a shell carrying the latter and having downward-extending arcuate lugs or flanges conforming to the aforesaid corresponding portions of the cutter or bit, a sleeve or washer having corresponding lugs contacting with the aforesaid lugs to provide for the reception between said shell and washer of said bit or cutter proper, a bolt passing through said washer and shell, and concentric with said circular edge portions and said flanges, and means to secure the several parts together.

2. An auger-bit comprising a removable cutter or bit proper, a shell carrying the latter and having axially-extending lugs or flanges, a sleeve or washer having corresponding flanges or lugs effective with the aforesaid flanges or lugs to provide for the reception between said sleeve and shell of said cutter or bit proper, a bolt passing through said washer and shell and having a notched inner end disk adapted to receive a dowel or pin of said bit-carrying shell, and means for securing said bolt in place against longitudinal displacement.

3. An auger-bit comprising a head or shell having downward-extended arcuate lugs and intermediately of the latter a central aperture and also a dowel or pin projecting from its inner surface, the removable bit proper having tangential lips and a central apertured portion resting upon said shell between said arcuate lugs, a sleeve or washer having upon its upper surface also arcuate lugs opposed to the aforesaid corresponding lugs to provide for the seating of said bit proper, a securing-bolt inserted through said shell or head, said cutter of bit proper and said sleeve or washer, and having an inner end notched disk adapted to receive said dowel or pin, and interlocking nuts screwed upon the projecting end of said securing-bolt.

4. A device of the character described, comprising a tubular carrying-head equipped with arcuate lugs or flanges, a sleeve having corresponding lugs or flanges contacting with the aforesaid lugs, a removable cutter or bit proper centrally seated between said lugs, said head having a central bolt-receiving aperture and equipped with a dowel, also dowel-receiving apertures, and a bolt passing through said sleeve and said cutter or bit and having applied to one end thereof means for securing it in place and provided at its opposite end with a disk having a notch receiving the projecting end of said dowel.

811,852. **SELF-GOVERNING CLUTCH.** ROBERT B. WYNN, Indianapolis, Ind., assignor to Hendricks Novelty Company, Indianapolis, Ind., a Corporation of Indiana. Filed June 22, 1905. Serial No. 266,643.



Claim.—1. The combination with a pulley and a shaft, of a self-governing clutch for transmitting power from one to the other consisting of oppositely-extending stems carried by the shaft, spring-actuated clutch-shoes slidably mounted on the stems and in engagement with the pulley, yielding means connecting said clutch-shoes, and weights secured to said yielding means so that the weights under high speed will reduce the pressure of the clutch-shoes against the pulley.

2. The combination with a driving-pulley and a driven shaft of oppositely-extending governor-stems secured to the shaft, brake-shoes slidably mounted on said stems, springs tending to push said brake-shoes into engagement with the pulley, a pair of bow-springs, one on each side of the shaft, that connect said brake-shoes, and a weight secured to the middle of each bow-spring revolving in a common plane.

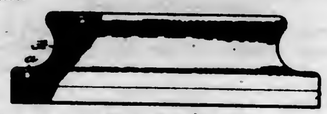
3. The combination with a shaft of a pulley consisting of a rim, a hub loosely mounted on the shaft and nearer than the rim, a side plate secured to the rim and hub, a plate secured to the end of the shaft and closing the opening, and a self-governing clutch mounted on said shaft and within said pulley.

811,853. **HORSESHOE.** HILLARD H. YOUNG, Catskill, N. Y. Filed Feb. 23, 1905. Serial No. 246,223.

Claim.—The combination with a horseshoe provided with integral downwardly-extending dovetail projections having dovetail grooves open at both ends and of the same width throughout their

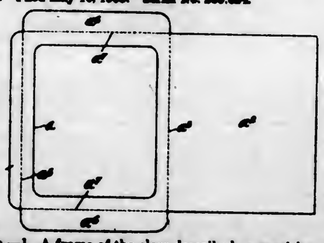
length and registering holes, the exterior side and end faces of said projections slanting inwardly and being straight, cleats of the shape of an equilateral triangle, each having a hole registering with the holes in the projection in which it is supported, the side and end faces of said cleats slanting inwardly and the end faces of the projections and cleats being flush, and pins passing through the holes in the projections and cleats, thereby securing said cleats removably in place, substantially as described.

811,854. LEVELER FOR FORMS OF TYPE. ANTHUR S. ALLEN, Brookline, Mass., assignor to United Printing Machinery Company, Boston, Mass., a Corporation of Maine. Filed Mar. 17, 1904. Serial No. 198,899.



Claim.—A type-leveling block comprising a body portion having a deep broad groove on its opposite edges or sides by which to hand-manipulate the block, and having parallel upper and lower surfaces, and a detachable facing for each of said surfaces disposed in parallel planes, said facing being formed of non-metallic, non-ligneous material to receive the impact of a pounding-tool and transmit the same to the type without injury.

811,855. PICTURE-FRAME. EDGAR G. ANTHONY, New York, N. Y. Filed May 16, 1905. Serial No. 260,624.



Claim.—1. A frame of the class described, comprising a frame member having a folding side member at one side thereof adapted to be folded over and to form the back of the frame, folding end members and a folding strip opposite the folding side member adapted to be folded over the corresponding edges of the side member, substantially as shown and described.

2. A frame of the class described, comprising a frame member having a folding side member at one side thereof adapted to be folded over and to form the back of the frame, folding end members and a folding strip opposite the side member adapted to be folded over the corresponding edges of the side member, and means for securing the said parts together at points around the frame member, substantially as shown and described.

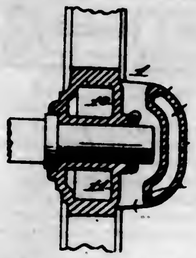
3. A frame of the class described, composed of a blank stamped from sheet metal and comprising a frame member, a folding side member connected with one side thereof and adapted to be folded over the frame member and to form the back of the frame, a folding strip opposite the folding side member and folding end members at each end of the frame, substantially as shown and described.

811,856. SELF-LUBRICATING WHEEL. THOMAS G. AUSTRAW, Fairmont, W. Va. Filed June 23, 1905. Serial No. 266,495.

Claim.—1. A self-lubricating wheel comprising wheel-body having a lubricating-chamber closed at one end and an integral cap for closing the other end of said chamber, said cap having a permanently-open passage to permit of the insertion and removal of means for securing the wheel to a support without interfering with the cap.

2. In a self-lubricating wheel, a wheel-body comprising a hub having a plurality of outlet-openings, a sleeve surrounding said integral with the hub and forming a lubricant-chamber and a cap projecting away and integral with the hub and sleeve and having a lubricant-feed passage communicating with said chamber.

3. In a self-lubricating wheel, a wheel-body comprising a hub having a plurality of outlet-openings, a sleeve surrounding and integral with the hub and forming a lubricant-chamber and a cap projecting away and integral with the hub and sleeve and having portions thereof forming a passage for the insertion and removal of means for securing the wheel upon a support without interfering with the cap.



4. In a self-lubricating wheel provided with a lubricant-chamber, the combination with the bottom, top and one end wall of said chamber, of closure means for the other end of said chamber and for forming a passage to permit of the insertion and removal of means for securing the wheel upon a support, said closure means consisting of a cap formed of a pair of members integral with and projecting away from one end of said top and bottom walls of said chamber, an inner wall integral with said top and bottom walls of the chamber and with the said members and projecting therefrom, and an outer wall inclosing said inner wall and integral with said members and top and bottom walls of the chamber and projecting away therefrom.

5. In a self-lubricating wheel provided with a lubricant-chamber, the combination with the bottom, top and one end wall of said chamber, of closure means for the other end of said chamber and for forming a passage to permit of the insertion and removal of means for securing the wheel upon a support, said closure means consisting of a cap formed of a pair of members integral with and projecting away from one end of said top and bottom walls of said chamber, an inner wall integral with said top and bottom walls of the chamber and with the said members and projecting therefrom, and an outer wall inclosing said inner wall and integral with said members and top and bottom walls of the chamber and projecting away therefrom, said inner and outer walls of said cap forming a lubricant-passage communicating with the chamber and said outer wall provided with a closable inlet.

6. A self-lubricating wheel consisting of an integral structure provided with a lubricant-chamber and an outwardly-extending closure-cap therefor, said closure-cap having a lubricant-passage communicating with the chamber and further provided with a permanently-open passage to permit of the insertion and removal of a linchpin without interfering with the cap.

7. A self-lubricating wheel, consisting of an integral structure provided with a lubricant-chamber and a closure-cap therefor, said cap having a lubricant-passage communicating with the chamber and further provided with a passage independent of said lubricant-passage and said lubricant-chamber to permit of the insertion and removal of a linchpin without interfering with the cap.

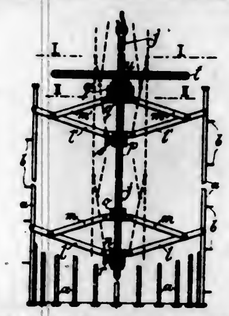
8. A self-lubricating wheel, consisting of an integral structure provided with a lubricant-chamber and a closure-cap therefor, said closure-cap having a lubricant-passage in front of and communicating with said lubricant-chamber and said cap further provided with a passage interposed between said lubricant-passage and said lubricant-chamber, said interposed passage adapted to permit of the insertion and removal of a linchpin without interfering with the cap.

9. A self-lubricating wheel consisting of an integral structure provided with a closed lubricant-chamber and a permanently-open passage to permit of the insertion and removal of a linchpin, said passage independent of said chamber.

10. A self-lubricating wheel consisting of an integral wheel-body provided with a lubricant and a permanently-open passage to permit of the insertion and removal of a linchpin.

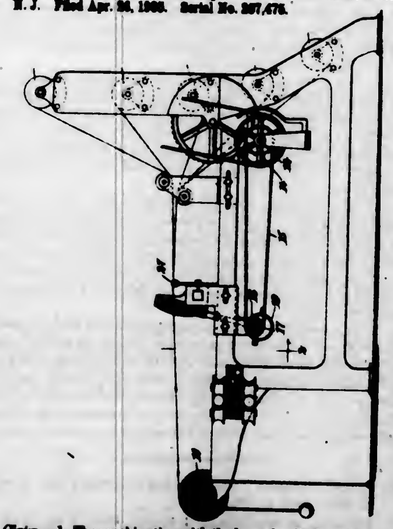
811,857. APPARATUS FOR MAKING OPEN-WORK WIRE RECEPTACLES. CORNELIUS VON ADAMY, Lippa, Austria-Hungary. Filed Nov. 14, 1904. Serial No. 232,602.

Claim.—1. An apparatus of the class described comprising a plurality of vertically-disposed bars provided with a plurality of projecting pins arranged to give the wound wire a spiral formation, a centrally-disposed shaft provided with screw-threads, sleeves rigidly secured to said shaft, links connecting said sleeves with each of said bars, loosely-mounted sleeves for said shaft, links connecting said sleeves with said first-mentioned links, a nut operating on the screw-threaded portion of the shaft and rotatively-connected with one of said movable sleeves for contracting or expanding the vertical bars in unison.



2. An apparatus of the class described comprising a plurality of vertically-disposed bars arranged in parallel relation and in the form of a cylinder and provided on their lower ends with enlarged base portions, said bars having on their outer faces a plurality of pins arranged to give the wound wire a spiral formation, a shaft provided with a threaded upper end and an annular shoulder on its lower end, a sleeve rigidly secured to the lower end of said shaft, links connecting said sleeve with two of said bars, a loosely-mounted sleeve located above said first-mentioned sleeve, links connecting said loosely-mounted sleeve and said first-mentioned links, an adjustable sleeve rigidly secured to the threaded portion of said shaft, actuating-links connecting said sleeve with said bars, a loosely-mounted sleeve located above said adjustable sleeve, links connecting said loosely-mounted sleeve with said actuating-links, and a nut rotatively secured to said loosely-mounted sleeve and engaging the threaded portions of said shaft, said nut being provided with a hand-wheel for contracting and expanding the bars in unison.

811,858. BRAIDING-MACHINE. FREDERICK A. RAHE, Paterson, N. J. Filed Apr. 26, 1905. Serial No. 257,475.



Claim.—1. The combination with the beam for discharging warp-threads having picks therein and a plurality of reels for receiving the warp-threads, of a plurality of knives extending between the threads of the warp, and means for reciprocating the knives.

2. The combination with the beam for discharging warp-threads having picks therein and a plurality of reels for receiving the warp-threads, of a plurality of knives extending between the threads of the warp, and means for reciprocating the knives in a direction substantially perpendicular to the tenor of the warp.

3. The combination with the beam for discharging warp-threads having picks therein and a plurality of reels for receiving the warp-threads, of a plurality of knives extending between the threads of the warp, means for reciprocating the knives, and means adjacent to the knives for supporting the warp.

4. The combination with the beam for discharging warp-threads, having picks therein and a plurality of wheels for receiving the warp-thread, of a plurality of sheaths extending between the thread of the warp, knives within the sheaths and extending therebeyond, and means for reciprocating the knives.

5. The combination with a means for winding or beaming warp-threads having picks therein, of a supporting-bar, a slide adjustably carried thereon, a sheath carried by the slide, a knife fitted in the sheath and having its edge projecting beyond the same, and means for driving the knife, said sheath and knife being adapted to fit between certain of the warp-threads to cut the picks therein.

811,859. MACHINE FOR FLESHING AND WORKING OUT HIDES AND SKINS. GEORGE W. BAKER, Wilmington, Del. Filed Feb. 10, 1905. Serial No. 245,168.

Claim.—1. In a hide-working machine, the combination with a horizontally-reciprocatory bed-roll and means for reciprocating the same having a clutch connection, of automatic cam-operated means for releasing the clutch to intermittently stop the bed-roll, and coacting pedal and weight operated means for causing the engagement of the clutch members to start the bed-roll in movement, substantially as specified.

2. In a hide-working machine, the combination with a reciprocatory bed-roll, a crank-shaft having an operating connection with said bed-roll, and a clutch connection, of automatic cam-operated means for releasing the clutch to intermittently stop the bed-roll, and coacting pedal and weight operated means for causing the engagement of the clutch members, substantially as specified.

3. In a hide-working machine, the combination with a reciprocatory bed-roll, a crank-shaft having an operating connection with said bed-roll, and a clutch-shaft having a driving connection with said crank-shaft and carrying a clutch, of cam-operated means for releasing the clutch members to intermittently stop the bed-roll, and coacting pedal and weight operated means for causing the engagement of the clutch members, substantially as specified.

4. In a hide-working machine, the combination with a reciprocatory bed-roll, a crank-shaft having an operating connection with said bed-roll and carrying a gear-wheel, a clutch-shaft having a gear-wheel in mesh with the gear-wheel of the crank-shaft and carrying a clutch, of cam-operated means for releasing the clutch members to intermittently stop the bed-roll, and coacting pedal and weight op-

ected means for causing the engagement of the clutch members, substantially as specified.

5. In a hide-working machine, the combination with a reciprocatory bed-roll, a crank-shaft having an operating connection with said bed-roll, and having a clutch connection, of a rock-shaft, cam-operated means in connection with said rock-shaft for releasing the clutch members to intermittently stop the bed-roll, and counting pedal and weight operated means in connection with said rock-shaft for causing the engagement of the clutch members, substantially as specified.

6. A hide-working machine having in combination a reciprocatory bed-roll, a crank-shaft having an operating connection with said bed-roll and having a gear-wheel provided with opposite cam projections, a clutch-shaft having a driving engagement with said crank-shaft and carrying a clutch, a rock-shaft having an arm adapted to engage said cam projections, and an arm engaging the loose member of said clutch to intermittently stop the bed-roll, and a weighted arm upon said rock-shaft and counting pedal-operated mechanism for causing the engagement of the clutch members to start the reciprocation of the bed-roll, substantially as specified.

7. A hide-working machine having in combination a reciprocatory bed-roll carrying a gear-wheel, feed-rolls with one of which the gear-wheel of the bed-roll has intermittent engagement, means for reciprocating said bed-roll having a clutch connection, cam-operated means for releasing the clutch members to intermittently stop the bed-roll, and pedal and weight operated means for causing the engagement of the clutch members, substantially as specified.

8. A hide-working machine, having in combination a reciprocatory bed-roll, an upright arm pivoted at its lower end and having a connection with said bed-roll at its upper end, a crank-shaft having an intermediate driving connection with said arm, and a clutch connection, cam-operated means for releasing the clutch members to intermittently stop the bed-roll, and pedal and weight operated means for causing the engagement of the clutch members, substantially as specified.

9. A hide-working machine having in combination a reciprocatory bed-roll, an upright arm pivoted at its lower end and having a connection with said bed-roll at its upper end, a crank-shaft having an intermediate driving connection with said arm, and having a gear-wheel provided with opposite cam projections, a clutch-shaft having a driving engagement with said crank-shaft and carrying a clutch, a rock-shaft having an arm adapted to engage said cam projections and an arm engaging the loose member of said clutch to intermittently stop the bed-roll, and a weighted arm upon said rock-shaft and counting pedal-operated mechanism for causing the engagement of the clutch members, substantially as specified.

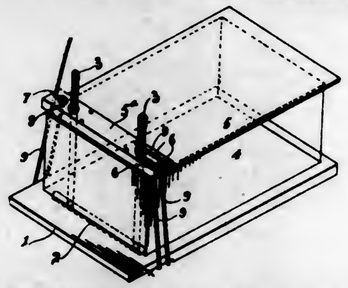
10. A hide-working machine having in combination a reciprocatory bed-roll, an upright arm pivoted at its lower end and having a connection with said bed-roll at its upper end, a crank-shaft having an intermediate driving connection with said arm and having a gear-wheel provided with opposite cam projections, a clutch-shaft having a driving engagement with said crank-shaft and carrying a clutch, a rock-shaft having an arm adapted to engage said cam projections and an arm engaging the loose member of said clutch to intermittently stop the bed-roll, and a pedal-operated arm having engagement with the gear-wheel of the crank-shaft and a weighted arm upon said rock-shaft for causing the engagement of the clutch members, substantially as specified.

11. In a hide-working machine, the combination with a horizontally-reciprocating bed-roll, and means for intermittently operating the same, of the journal-bearing slides, the adjustable perforated screws and trunnioned nuts, the adjustable threaded stems passing through said nuts, and connected to said slides, the compression-springs, and the adjustable rear stop-screws, substantially as specified.

811,860. TEMPORARY BINDER. JOHN S. BARLOW, Grand Rapids, Mich. Filed July 20, 1905. Serial No. 271,812.

Claim.—1. In a temporary binder a bottom member, a binding-strip member adjustable to and from the bottom, means for sliding engagement between said two members permitting such adjustability, a binding-cord passing below said bottom member, and said binding-strip member provided with means for attaching one end of said binding-cord and for clamping the free end of said binding-cord thereto.

2. In a temporary binder, a bottom member, a binding-post rising therefrom, a binding-strip member provided with means for obtaining a sliding engagement between it and said binding-post, a binding-cord extending beneath said bottom member, and said binding-strip member provided with means at one end for attaching one end of the binding-cord thereto and provided at its other end with a binding-slot for clamping the free end of said cord thereto.



3. In a temporary binder a bottom, a binding-post rising therefrom, a binding-strip, means for sliding engagement between the binding-post and the binding-strip, a slot in one end of said binding-strip, through which slot one end of the binding-cord may be inserted, a binding-cord, and a slot in the other end of said binding-strip through which the binding-cord may pass.

4. In a temporary binder a bottom, a binding-post rising therefrom, a binding-strip, means for sliding engagement between the binding-post and the binding-strip, a binding-cord, means for attaching one end of the cord to the binding-strip near one end of the strip, and two slots in the binding-strip at the other end thereof through which the binding-cord may pass and repass, said slots being of a width less than the diameter of the cord.

5. In a temporary binder a bottom, a binding-post rising therefrom, a binding-strip, means for sliding engagement between the binding-strip and the binding-post, a binding-cord, means for attaching one end of the binding-cord to the binding-strip, means for detachably fastening the binding-cord to the binding-strip near one end thereof, and a rabbet from the under surface of the bottom board whereby the binding-cord can be passed beneath the bottom board without lifting the same from the table.

6. A temporary binder comprising a base, a binding-strip member vertically adjustable thereon, and a binding-cord attached at one end to said member and having its other end clamped to said member, said cord passing below said base.

7. In a temporary binder, a bottom member, a binding-strip member adjustable to and from said bottom member, means carried by one of said members and extending through the other of said members for forming the sliding engagement between the two members, and a binding-cord attached to one side of one of said members and having the other end thereof detachably clamped to the other side of said member.

8. In a temporary binder, a bottom member, a binding-strip member adjustable to and from said bottom member, means for sliding engagement between said two members permitting of the adjustability of said binding-strip member, and a binding-cord for a portion of its length extending parallel with one of said members and having one end attached and its free end clamped to the other of said members.

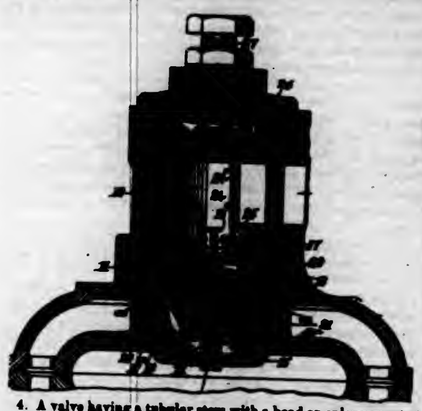
9. In a temporary binder, a bottom member, a binding-post rising therefrom, a binding-strip member, means for sliding engagement between the binding-post and the binding-strip, a binding-cord, means for attaching one end of the binding-cord to one of said members, and one of said members having an open-ended binding-slot, said slot being of less width than the diameter of the binding-cord, whereby said slot will bind and grip the free end of said cord.

811,861. VALVE. HARRY W. BEACH, Montrose, Pa. Filed Mar. 22, 1905. Serial No. 251,661.

Claim.—1. A valve having a tubular stem, a rod extending through the stem, and fastened therein adjacent to the valve, and means coacting with the end of the rod opposite the valve for sustaining the rod and its attachments.

2. A valve having a tubular stem, a rod extending through the stem and having one end in connection with the valve, and means coacting with the other end of the rod for sustaining the rod and its attachments.

3. A valve having a tubular stem with a head or enlargement at the end opposite the valve, a rod extending through the stem and having one end in connection with the valve, the other end of the rod having an enlargement adapted to engage the stem, and means for sustaining the rod and its attachments through the medium of the head of the valve-stem.



4. A valve having a tubular stem with a head or enlargement at the end opposite the valve, a rod extending through the tubular stem and having one end in connection with the valve, the rod having at the opposite end a head or enlargement adapted to engage the valve-stem, a spring pressing the head of the valve-stem upward, and a stop for limiting the upward movement of the head.

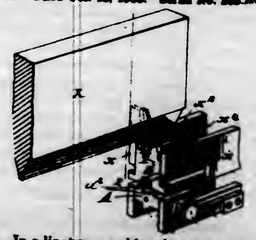
5. The combination with a valve-seat, of the valve coacting therewith, a tubular stem connected to the valve and having a head or enlargement at the end opposite the valve, a stem-guide, a spring bearing between the stem-guide and the head of the valve-stem, a rod extending through the tubular stem and having connection with the valve, and a stop lying opposite the enlargement on the head and adapted to be engaged by the head upon the fracture of the valve-stem.

6. The combination of a valve, a stem connected thereto, a rod also connected to the valve, means operative upon the fracture of the stem for connecting the rod and stem at the end of the stem removed from the valve, and a means for sustaining the last-named end of the stem.

7. The combination of a valve, a stem connected thereto, a rod also connected to the valve, means operative upon the fracture of the stem for connecting the rod and stem at the end opposite the valve, a spring pressing said end of the stem to sustain the stem and valve, and a stop for limiting the movement of the stem under the action of the spring.

8. The combination with a valve-seat, of a valve coacting therewith, a tubular stem connected to the valve, a rod extending through the tubular stem and connected to the valve, means operative upon the fracture of the stem for joining the rod and stem at the end removed from the valve, a split stem-guide loosely receiving the tubular stem, a spring acting between the stem-guide and stem, and a stop for limiting the movement of the stem under the action of the spring.

811,862. LINOTYPE-MACHINE. RICHARD M. RUSSELL, Brooklyn, N. Y., assignor to Mergenthaler Linotype Company, a Corporation of New York. Filed Oct. 15, 1905. Serial No. 282,984.



Claim.—1. In a linotype-machine the combination of a distributer and means adjustable at will to direct advancing matrices to the distributer, or through a path clear of the distributer.

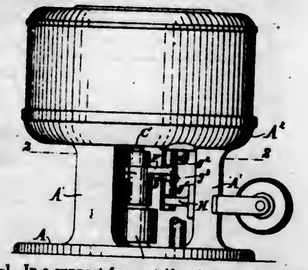
2. In a linotype-machine of the class shown, the upper distributer, X, in combination with means for delivering matrices thereto, said means including a member adjustable at will to permit the passage of the matrices clear of said distributer for delivery to the lower distributer.

3. In combination the distributer-bar, the matrix-sustaining rails adapted to let the matrices fall clear of the said bar, the notched matrices and the movable matrix-support to carry the matrices into engagement with the bar when required.

4. In a linotype-machine and in combination, the distributer-bar, the shouldered rails, *s*, the matrices notched at the lower end, and a matrix-support adjustable at will to enter the notches or to act on the matrices outside of the notches as demanded.

5. In a linotype-machine, the combination of a distributer, means for delivering the matrices thereto, notched matrices, and the support, revolvable at will and constructed substantially as shown, to sustain the advancing matrices at a high level or permit their descent to a lower level according to the position in which it is placed.

811,863. SUPPORT FOR CENTRIFUGAL EXTRACTORS. GOTTLOB EHMER, Philadelphia, Pa., assignor to The Bernes and Erb Company, Philadelphia, Pa., a Corporation of West Virginia. Filed Mar. 26, 1904. Serial No. 199,994.



Claim.—1. In a support for centrifugal extractor, in combination, the basket-spindle, a spider comprising a plurality of projecting arms, and having a bearing on the spindle adapted to maintain substantially constant the angle of divergence of the spider and the spindle, a guiding device for each arm along which the outer end of the latter is adapted to move, and a yielding device above and a yielding device below each of said arms, whereby, in the angular movement of the spindle, the arm acts on one or the other of the corresponding yielding devices.

2. In a support for centrifugal extractor, in combination, the basket-spindle, a spider having an inner cylindrical bearing end to maintain substantially constant the angle of divergence of the spider from the spindle, said spider comprising a plurality of projecting arms, a guiding device for each arm which the outer end of the arm engages, and a pair of yielding devices, one above and one below each of said arms, whereby, in the angular movement of the spindle, the spider acts on the lower yielding device only of one pair and the upper yielding device only of another pair.

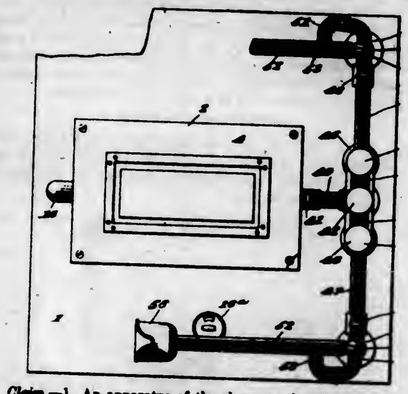
3. In a support for centrifugal extractor, in combination, the basket-spindle, a spider having a bearing on the spindle and comprising a plurality of projecting arms, a guiding device for each arm, a support for the lower end of each guiding device, the arm loosely surrounding the guiding device substantially midway between its ends, a yielding device above each arm, means to hold the same from vertical bodily movement, and a yielding device between each arm and the support.

4. In a support for centrifugal extractor, in combination, the basket-spindle, a spider having a bearing on the spindle and comprising a plurality of projecting arms, a bolt supporting the outer end of each arm, a support for the lower end of each bolt, a washer on the bolt above the support, a spring on the bolt above said washer, a second washer on said bolt above said spring, the outer end of the arm surrounding the bolt above said second washer, a third washer on the bolt above the arm, a second spring on the bolt above said third washer, a fourth washer on the bolt above said second spring, and a nut on the bolt above said fourth washer.

5. In a support for centrifugal extractor, in combination, a base, the basket-spindle, supported at its lower end on the base so as to be free to oscillate thereon, the spindle being confined from angular movement at no other point, a spider having a bearing on the basket-spindle adapted to maintain constant the angle of divergence of the

spider from the spindle, said spider comprising a plurality of projecting arms, a guiding device for the outer end of each arm secured to the base so as to be capable of oscillating thereon, and a pair of tension devices on each guiding device, one above and one below the corresponding arm, whereby, in the angular movement of the spindle, an arm acts on one or the other of its corresponding tension devices and the capacity for oscillation of the basket is limited only by the yielding capacity of the tension devices.

811,864. OZONE-GENERATOR. CHARLES F. BEEMAN, Chicago, Ill. Filed June 8, 1905. Serial No. 264,462.



Claim.—1. An apparatus of the character described having a generating-chamber, two sets of circuit-terminal windings in said chamber, the terminal windings of one set alternating with those of the other and a source of electrical supply comprising conductors each of which has parallel connections with the circuit-terminal windings of one set within the generating-chamber.

2. An apparatus of the character described having a generating-chamber, two sets of circuit-terminal windings in said chamber, the terminal windings of one set alternating with those of the other, a source of electrical supply comprising conductors each of which has parallel connections with the circuit-terminal windings of one set and glass plates extended in the generating-chamber between the circuit-terminal windings of opposite polarity.

3. An apparatus of the character described having a generating-chamber, means for admitting and withdrawing air to and from the chamber, two flattened wire coils within said generating-chamber, a glass plate extended in the chamber between said wire coils and a source of electrical supply comprising conductors of opposite polarity and connected, respectively, with the respective flattened wire coils in said chamber.

4. An apparatus of the character described having a generating-chamber, means for admitting and withdrawing air to and from the chamber, two wire coils within the generating-chamber and spaced apart, means for supporting said wire coils, a glass plate extended in the chamber between said wire coils and a source of electrical supply comprising conductors of opposite polarity and connected, respectively, with the respective wire coils in the generating-chamber.

5. An apparatus of the character described having a generating-chamber, means for admitting and withdrawing air to and from the chamber, glass partitions extended in said chamber and spaced apart, whereby passages are produced between them for the flow of air admitted to and withdrawn from the chamber, circuit-terminal windings arranged in the passages and a source of electrical supply comprising conductors of opposite polarity connected, respectively, with the respective circuit-terminal windings in said passages of the generating-chamber.

6. An apparatus of the character described having a generating-chamber, means for admitting and withdrawing air to and from the chamber, glass partitions extended in said chamber and spaced apart, whereby passages are produced between them for the flow of air, a source of electrical supply comprising conductors of opposite polarity and two sets of circuit-terminal windings connected, respectively, in parallel with the respective conductors and alternately arranged in the passages between said partitions in the generating-chamber.

7. An apparatus of the character described having a generating-chamber, means for admitting and withdrawing air to and from the chamber, glass partitions extended in the chamber and spaced apart to produce between them passages adapted for the flow of air, a source of electrical supply comprising conductors of opposite polarity, plates of insulating material extended in the passages between the partitions of the generating-chamber and wire coils extended upon said plates of insulating material and connected, respectively, with the respective conductors of said source of supply.

8. An apparatus of the character described comprising a casing having a chamber the end walls of which have parallel grooves, glass plates extended lengthwise in said chamber with end edges engaged in said grooves, means for admitting and withdrawing air to and from said chamber, a source of electrical supply comprising conductors of opposite polarity and terminal windings arranged in the generating-chamber between said glass plates and connected, respectively, with the respective opposite conductors of said source of supply.

9. An apparatus of the character described comprising a casing having a chamber the end walls of which have parallel grooves, supply and discharge pipes connected with said end walls for the supply and discharge of air to and from said chamber, glass partitions the end edges of which are held in said grooves, said partitions being extended lengthwise in said chamber and being spaced apart to produce passages between them, and the end edges of said partitions being cut out to afford communications between said passages at the ends of the chamber, a source of electrical supply comprising conductors of opposite polarity and terminal windings arranged in the passages of the generating-chamber between said partitions and connected, respectively, with the respective opposite conductors of said source of supply.

10. An apparatus of the character described comprising a casing having a chamber, means for supplying and withdrawing air to and from the chamber, glass partitions extended in the chamber parallel with each other but spaced apart to produce passages for the flow of air, other glass plates arranged in the passages between said partitions, terminal windings carried on said last-named glass plates and a source of electrical supply comprising conductors of opposite polarity each of which has connection with alternate windings in the generating-chamber.

11. An apparatus of the character described comprising a casing having a chamber, means for supplying and discharging air to and from said chamber, glass partitions extended lengthwise of the chamber parallel with each other but spaced apart to produce passages for the flow of air, shorter glass plates in the passages between said partitions, strips extended transversely of the generating-chamber and having means of engagement with the upper and lower edges of said shorter glass plates for retaining them in position, terminal windings carried on the shorter glass plates and a source of electrical supply comprising conductors of opposite polarity each of which has connection with alternate windings in the generating-chamber.

12. An apparatus of the character described comprising a casing having a generating-chamber, a glass plate extended therein, a source of electrical supply comprising conductors of opposite polarity and terminal windings connected therewith and arranged in the generating-chamber at opposite sides of said glass plate, means for withdrawing air from the casing, and means for supplying air to the generating-chamber and comprising an air pipe or conduit and an air-forcing means connected therewith.

13. An apparatus of the character described comprising a casing having a generating-chamber, a glass plate extended therein, a source of electrical supply having conductors of opposite polarity and terminal windings connected therewith and arranged in the generating-chamber at opposite sides of said glass plate, means for supplying air to the generating-chamber and comprising an air pipe or conduit and an air-forcing device connected therewith, means for withdrawing air from the casing and means for controlling the operation of said air-forcing device.

14. An apparatus of the character described comprising a casing having a generating-chamber, a glass plate extended therein, a source of electrical supply having conductors of opposite polarity and terminal windings connected therewith and arranged in the generating-chamber at opposite sides of said glass plate, means for supplying air to the generating-chamber and means for withdrawing air from said chamber and comprising an air-conduit having a controlling-valve.

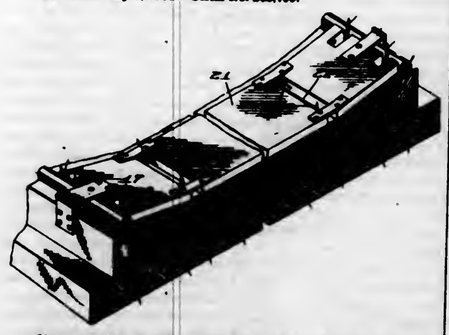
811,865. DEVICE FOR DETACHABLY SECURING RUBBER HEELS TO BOOTS AND SHOES. HIRAM P. BOLIN, Brockton, Mass., assignor of one-half to William G. Smith, Brockton, Mass. Filed Aug. 31, 1904. Serial No. 223,897.

Claim.—1. A heel-section for a boot or shoe having a plate composed of curved lateral cross-bars embedded therein and having its side edges bent inwardly to form guideways, combined with a companion plate carrying a plurality of upwardly-projecting prongs, secured to the bottom of the boot or shoe, same adapted to be slidably engaged by the first-mentioned plate, and each of said plates having yieldable extensions, the terminals of which are bent to interlock and prevent the movement of the last-mentioned plate in one direction.

2. A heel-section for a boot or shoe having a plate embedded therein with the side edges bent to present guideways, combined with a companion plate carrying a plurality of prongs, secured to the bottom of the boot or shoe, same adapted to be slidably engaged by the first-mentioned plate, and having laterally-extending projections or stops to limit the movement of the last-mentioned plate in one direction.

3. A heel-section for a boot or shoe having a plate embedded therein with its side edges bent to present guideways, combined with a companion plate carrying a plurality of prongs, secured to the bottom of the boot, same adapted to be slidably engaged by the first-mentioned plate, each of said plates having yieldable extensions, said members being bifurcated, two opposing branches of the bifurcation being yieldably interlocked, and the other two opposing branches being outwardly divergent to present an opening for the reception of an implement to separate the interlocked branches.

811,866. UPHOLSTERY APPARATUS. PETER BOLLER, Chicago, Ill. Filed July 8, 1905. Serial No. 268,709.



Claim.—1. In a device for manufacturing roll-edge upholstery, a form or mold having rails providing central and lateral channels, parallel rows of pins on the rails, and a divided follow-board each section of which is hinged to one of the outer rails so as to clear the rod located in the edge roll and provided with openings or passages adapted to receive the pins.

2. In an apparatus for manufacturing roll-edge upholstery, a form having rails providing central and parallel side channels, pins on the rails, and a divided follow-board each section of which is hinged to an outer rail beyond the pins thereon and provided with openings or passages in alinement with the rails when the parts are assembled.

3. In an apparatus for manufacturing roll-edge upholstery, a form having central and lateral parallel channels, inclined pins outside of the lateral channels and adapted to retain parallel rods along their outer faces.

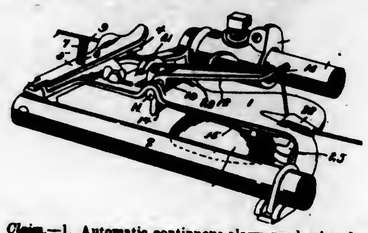
4. In a device for manufacturing roll-edge upholstery, a form having parallel rails providing central and lateral channels, pins on the outer rails, and flexible stays or cross-braces adapted to extend between the rods on the outer rails outside of the pins thereof.

5. In an apparatus for manufacturing roll-edge upholstery, a form having pin-rails providing central and lateral channels, and flexible stays or cross-braces having seats at their ends adapted to receive rods located on the outer rails outside of the pins thereof.

6. In an apparatus for manufacturing roll-edge upholstery, a form having rails providing central and lateral channels, and stays or cross-braces adapted to brace rods located in the edge rails and to be removed therefrom by bending one of the coacting parts.

7. In a device for manufacturing roll-edge upholstery, a form having rails providing central and lateral channels, the outer rails having pins and being grooved for the passage of a needle through the upholstery attached to such rails by the pins.

811,867. CORD TENSION-ALARM. CHARLES BRANDSROVE, Monroe, Mich. Filed Mar. 20, 1905. Serial No. 250,717.



Claim.—1. Automatic continuous-alarm mechanism for grain-binders comprising a cord tension device, means for adjusting said cord tension device, a bell, a bell-hammer, a cord-take-up arm, a spring-catch for holding the hammer inactive, means for adjusting said spring-catch, means on the take-up arm for tripping said spring-catch, a rotary shaft, and a hammer-actuating device thereon.

2. Automatic continuous-alarm mechanism for grain-binders comprising a cord tension device, means for adjusting said cord tension device, a bell, a bell-hammer, a cord-take-up arm, a spring-catch for holding the hammer inactive, means for adjusting said spring-catch, means on the take-up arm for tripping said spring-catch, a trigger on the bell-hammer, actuating-springs for the alarm mechanism, and a rotary hammer-actuating device connected with an element of the grain-binder mechanism.

3. Automatic continuous cord alarm mechanism for grain-binders comprising a cord tension device, means for adjusting said cord tension device, a bell, a bell-hammer, means for holding the hammer normally inactive, means controlled by the breaking or running out of the cord for releasing the hammer, and means on a continuously-moving part of the binder mechanism for actuating the hammer when released, substantially as and for the purpose described.

4. Automatic continuous cord alarm mechanism for grain-binders, comprising a cord tension device, means for adjusting said cord tension device, a bell, a bell-hammer, a spring-catch, means for adjusting said spring-catch, a rotary hammer-actuating device on the packer-shaft of the binder, a trigger for normally holding the hammer out of the path of movement of its actuating device, and means controlled by the tension of the cord for operating the trigger when the cord breaks or runs out.

5. Automatic continuous-alarm mechanism for grain-binders, comprising a cord tension device, a spring-catch, actuating-springs, a bell, a bell-hammer, a hammer-trigger, a suitably-constructed frame for corn and grain binders, operating connections between an element of the binder and the hammer-trigger, a cord-take-up device provided with means for tripping the spring-catch and releasing the hammer-trigger.

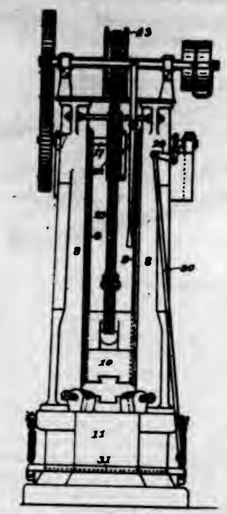
6. Automatic continuous cord alarm mechanism for grain-binders comprising an alarm-frame, a cord tension device, means for adjusting said cord tension device, a bell, a bell-hammer, a packer-shaft, a hammer tappet device on said shaft, a cord-take-up arm provided with a tripping device, a spring-catch for holding the hammer inactive until the cord breaks or runs out.

811,868. DROP-HAMMER. EDWARD S. ELLEY, Coventry, England. Filed May 26, 1905. Serial No. 262,305.

Claim.—1. In a drop-hammer, in combination with a hammer-head, a continuously-driven shaft, a lifting-pulley fixed thereon, a block operatively associated with said pulley and provided with an arm having a slot, rollers at opposite ends of said slot, a sleeve slidably and loosely mounted on the shaft of said pulley and provided with oppositely-inclined cam-surfaces interposed between and engaging said rollers, means for operating said sleeve to cause its cam-surfaces to move the block into or out of engagement with said pulley, and a band connected at opposite ends to said hammer-head and block, respectively.

2. In a drop-hammer, in combination with a hammer-head, a lifting-pulley, a circular frame partly surrounding said pulley, a

block located between said pulley and frame, a lifting-band connected at opposite ends to said hammer-head and block, respectively, and means for moving said block into engagement with said pulley to cause the hammer-head to be lifted, or into engagement with said frame to hold the hammer-head at any desired elevation.



3. In a drop-hammer, in combination with a hammer-head, a lifting-pulley, a block operatively associated with said pulley, a band connected at opposite ends to said hammer-head and block, respectively, means for causing said block to frictionally engage said pulley, a roller on said block, and a fixed member having an inclined surface adapted to be engaged by said roller in the rotation of said pulley to cause the block to be forced out of engagement with said pulley, substantially as described.

811,869. RAIL-JOINT. CHARLES C. BROWN, West Greensburg, Pa. Filed Aug. 28, 1905. Serial No. 275,962.

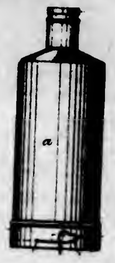
Claim.—1. In a rail-joint, the combination with the confronting ends of two sections of rails, said rails having their heads cut away, the web portions of said rails having substantially V-shaped notches formed therein; a yoke adapted to fit down over the web portions of said rails, said yoke consisting of fish-bars; a head carried by said fish-bars; depending lugs carried by said head and adapted to fit within said notches; means to secure said yoke and rails together upon a suitable support or foundation; substantially as described.

2. In a rail-joint, the combination with the confronting ends of two sections of rails, the heads of said rails being cut away, the web portions of said rails having notches formed therein; a yoke adapted to fit over the web portions of said rails; depending lugs carried by said yoke and adapted to fit within said notches; and means to secure said yoke and said rails upon a suitable support; substantially as described.

3. In a rail-joint, the combination with the confronting ends of two sections of rails, the head of said rails being cut away, the web portions of said rails having V-shaped notches therein; a yoke adapted to fit down over the web portions of said rails; and means carried by said yoke to engage in said notches, as and for the purpose described.

811,870. DENTAL CAP. WILLIAM BEHSE, Weehawken, N. J. Filed June 6, 1905. Serial No. 263,964.

Claim.—A dental cap provided with a countersunk bottom, a depending flange having a notch, a cap removably embracing the flange and having a perforation adapted to be alined with the notch, and a tongue, substantially as specified.



811,871. GATE. ISAAC R. BURKHOLDER, Dayton, Ohio, assignor of one-half to Charles M. Heist, Cincinnati, O. Filed Aug. 29, 1905. Serial No. 276,209.

Claim.—1. The combination with a gate, a pintle member located at the upper portion of the inner upright of the gate and an eyebolt extending from the lower portion of the same upright, of a swing-post provided with a pintle at its lower portion adapted to enter the said eyebolt of the gate, brackets secured to the upper portion of the swing-post, one bracket being provided with an upwardly-extending pintle and the other bracket with an aperture, a shaft passed through the said aperture in the said bracket, which shaft has an aperture in its lower end to receive the said pintle of the other bracket, a lug extending out from the shaft, apertured to receive the hinge-pintle of the gate, a sweep or crown-piece attached to the upper portion of the shaft and of segmental formation, provided at its outer or convexed portion with transverse fingers having their outer faces concaved, and operating-ropes for the gate attached to opposite ends of the convexed outer portion of the sweep and extending in opposite directions in engagement with said fingers, and guides for said operating-ropes.

2. A gate provided with a hinge-rod passing loosely through its forward and its rearward end uprights, the forward end of the said hinge-rod being threaded, and the rear end being downwardly bent to form a pintle, an adjusting-nut at the threaded end of the said hinge-rod, a shaft having an apertured lug for engaging the pintle, upper and lower bearings for the shaft, a crown-piece or sweep carried by the shaft, guide-fingers located upon the semicircular section of the sweep, operating-ropes for the gate attached to opposite ends of the sweep, an eye secured to the lower part of the rear end upright, and a pintle engaging the eye.

811,872. NUMBERING ARRANGEMENT FOR USE IN CONNECTION WITH PRINTING AND NUMBERING MACHINES. DAVID CARLAW, Sr., DAVID CARLAW, Jr., ALEXANDER L. CARLAW, and JAMES W. CARLAW, Glasgow, Scotland. Filed July 12, 1905. Serial No. 270,127.

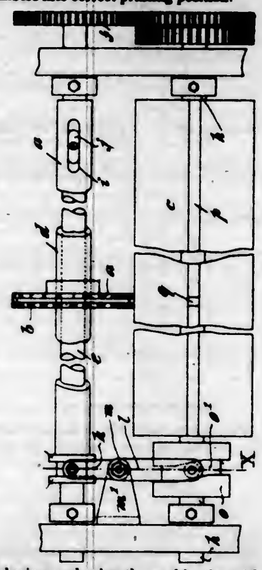
Claim.—1. In numbering mechanism the combination with a surface for receiving impressions of numbering means said means being automatically moved back and forward laterally so as to bring the numbers into correct printing position.

2. In numbering mechanism the combination with a surface for receiving impressions of a numbering-disk having numbers thereon said disk being automatically moved back and forward laterally so as to bring the numbers into correct printing position.

3. In numbering mechanism the combination with a surface for receiving impressions of numbering-disks having numbers thereon said disks being automatically moved back and forward laterally so as to bring the numbers into correct printing position.

4. In numbering mechanism the combination with a surface for receiving impressions of a numbering-disk having ridges with numbers thereon said disk being automatically moved back and forward laterally so as to bring the numbers into correct printing position.

5. In numbering mechanism the combination with a surface for receiving impressions of a numbering-disk having two parallel circumferential ridges thereon each ridge having a set of numbers said disk being automatically moved back and forward laterally so as to bring the numbers into correct printing position.



6. In numbering mechanism the combination with a surface for receiving impressions, of a numbering-disk, a sleeve, a shaft, and means for automatically moving the sleeve laterally on the shaft to move said disk back and forward in the direction of the length of said shaft.

7. In numbering mechanism the combination with a surface for receiving impressions, of a shaft, a sleeve on the shaft, a numbering-disk adjustably fitted on the sleeve, a lever for moving the sleeve laterally and means for operating the lever.

8. In numbering mechanism the combination with a surface for receiving impressions, of a shaft, a sleeve on the shaft, a numbering-disk adjustably fitted on the sleeve, a lever for moving the sleeve laterally, a cam for operating the lever and means for rotating the cam.

9. In numbering mechanism the combination with a surface for receiving impressions of a strip let into said surface, a raised part on the strip, numbering means, and means for shifting said numbering means laterally.

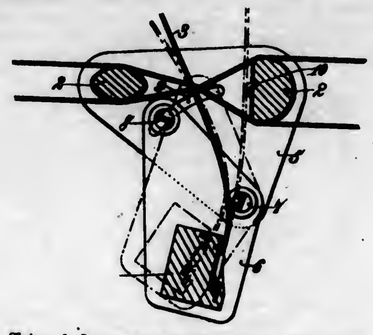
10. In numbering mechanism the combination with a cylindrical surface for receiving impressions of a strip let into said surface along a line which is parallel to the axis of the cylindrical surface a raised part on the strip, numbering means and means for shifting said numbering means laterally.

11. In numbering mechanism the combination with a surface for receiving impressions, of a shaft, a sleeve on the shaft, numbering-disks adjustably fitted on the sleeve, a lever for moving the sleeve laterally, a cam for operating the lever, means for sliding the cam and means for operating the said sliding means.

12. In numbering mechanism the combination with an impression-cylinder, of a shaft for said cylinder, a second parallel shaft, means for driving the second shaft from the first shaft, a sleeve on the second shaft, numbering-disks on the sleeve, a lever for moving the sleeve laterally on its shaft, a cam on the cylinder-shaft for operating said lever, means for moving said cam laterally on its shaft, a second cam for operating said moving means and mechanism for rotating the second cam.

13. In numbering mechanism the combination with an impression-cylinder, of a shaft for said cylinder, a second parallel shaft, means for driving the second shaft from the first shaft, a sleeve on the second shaft, numbering-disks on the sleeve, a lever for moving the sleeve laterally on its shaft, a cam with two grooves slidably fitted on the cylinder-shaft, a bar with pin engaging one of the grooves, a second cam adapted to engage a second pin on the said bar and worm-gearing for operating said second cam.

811,873. WARP STOP-MOTION. THOMAS A. B. CARVER, Glasgow, Scotland. Filed Feb. 1, 1905. Serial No. 243,788.



Claim.—1. In a warp stop-motion for looms, the combination of a pair of lease-rods by means of which the warp-threads are crossed, and a plurality of resilient wires arranged to be held under pressure by the respective crossing warp-threads and adjustable to vary such pressure.

2. In a warp stop-motion for looms, the combination of a pair of lease-rods by means of which the warp-threads are crossed, and a plurality of resilient wires arranged to be held under pressure by the respective warp-threads and adjustable to vary their deflection.

3. In a warp stop-motion for looms, the combination of a pair of lease-rods by means of which the warp-threads are crossed, a plurality of resilient wires arranged to be held under pressure by the respective warp-threads and adjustable to vary such pressure, and an electric conductor carried by one of the lease-rods and arranged for engagement by a wire when one of the threads holding said wire breaks.

4. In a warp stop-motion for looms, the combination of a pair of lease-rods by means of which the warp-threads are crossed, a plurality of resilient wires arranged to be held under pressure by the respective crossing warp-threads, and a movably-mounted base carrying said wires.

5. In a warp stop-motion for looms, the combination of lease-rods by means of which the warp-threads are crossed, a plurality of resilient wires arranged to be held under pressure by the respective crossing warp-threads, a base carrying the wires, swinging means to which said base is connected thereby to vary the pressure against said wires, and means for holding said swinging means in an adjusted position.

6. In a warp stop-motion for looms, the combination of means for holding warp-threads crossed, and yieldable means held under pressure by the respective crossing-threads and adjustable to secure a regulation of such pressure.

7. In a warp stop-motion for looms, the combination of a detector engaging with crossed warps with means for regulating the pressure of engagement between the detector and the warps.

8. In a warp stop-motion for looms, the combination of a detector engaging with crossed warps with means operated by the loom for varying the pressure of engagement between the detector and to warps conformably with the tension of the latter.

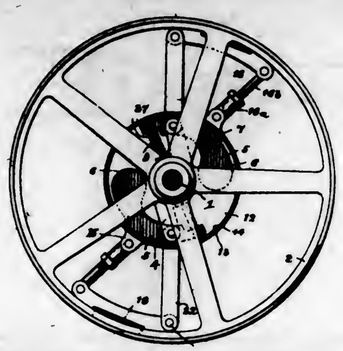
811,874. FRICTION-CLUTCH AND GOVERNOR. CARL CHRISTMANN, Crenshaw, Miss. Filed July 20, 1904. Serial No. 217,720.

Claim.—1. In a device of the class described, in combination, a shaft, a member rigid therewith governor-weights carried by said member, a friction-clutch controlled by said governor-weights, a pulley, shoes cooperating therewith, and a connection between said shoes and said clutch.

2. In a device of the class described, in combination, a shaft, a pulley carried rigidly thereby, a friction-wheel carried loosely and a hub carried rigidly by said shaft, governor-weights carried by said hub, and cooperating with said friction-wheel, to constitute a clutch, shoes mounted adjacent to said pulley, and links connecting the shoes with said wheel.

3. In a device of the class described, in combination, a shaft, a loose wheel carried thereby, a tight pulley carried thereby, governor-weights rotating with said shaft and having rubbing-faces which may engage said loose wheel, shoes cooperating with said tight pul-

ley, links connecting said shoes with said loose wheel, and affording means for transmitting the rotation of said shoes.



4. In a device of the class described, in combination, a shaft, a tight pulley carried thereby, a loose wheel carried thereby, a speed-controlled clutch member coöperating with said loose wheel, shoe-bars, shoes carried thereby rubbing the face of said tight pulley, links connecting the said shoe-bars with said loose wheel, and a hub loose upon said shaft and having projecting arms to which said shoe-bars attach.

5. In a device of the class described, in combination, a shaft, a tight pulley carried thereby, a loose wheel carried thereby, a loose hub carried by said shaft, adjacent to said loose wheel, stops for limiting the rotation of said hub with respect to said loose wheel, springs normally restraining said hub into an extreme position with respect to said loose wheel, shoe-bars attached to said hub and having shoes rubbing against said tight pulley, means for connecting said shoe-bars with said loose wheel, and speed-controlled mechanism for rotating said loose wheel.

6. In a device of the class described, in combination, a shaft, a tight pulley carried thereby, a loose wheel carried thereby, a loose hub carried by said shaft adjacent to said loose wheel, said loose wheel having projections constituting stops therefor, springs normally restraining said hub to engage said stops, said hub comprising oppositely-disposed sockets, arms attached in said sockets, shoe-bars attached to said arms and having shoes adapted to rub the face of said tight pulley, links connecting said shoe-bars with said loose wheel, and speed-controlled mechanism for rotating said loose wheel.

7. In a device of the class described, in combination, a shaft, a tight pulley carried thereby, a loose wheel carried thereby, a hub carried rigidly by said shaft, governor-arms pivotally carried by said hub and having rubbing-faces adapted to engage said loose wheel, a loose hub carried by said shaft, projecting arms attached thereto, shoe-bars attached to said arms and having shoes adapted to rub the face of said tight pulley, links connecting said shoe-bars with said loose wheel, and springs connecting said loose hub with said loose wheel.

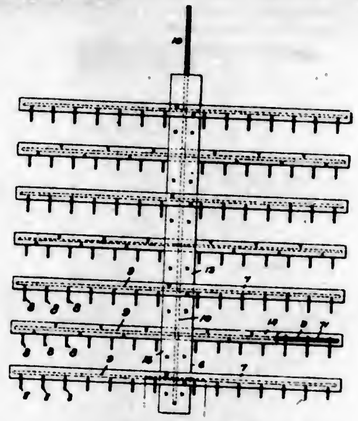
811,875. WIRED PLATING AND DIPPING RACK. JAMES P. CLARK, Newark, N. J. Filed June 26, 1905. Serial No. 267,282.

Claim.—1. The improved plating-rack, comprising a center bar, a series of transverse bars secured to said center bar and a series of hooks supported by one of said transverse bars, and protected conducting-wires in electrical connection with said hooks and with a suspensory conducting-wire.

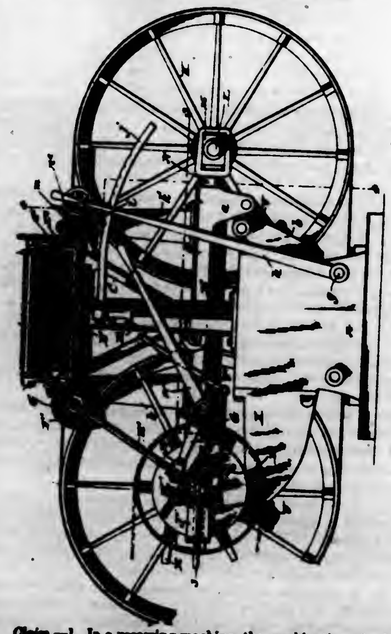
2. The combination with the longitudinally-grooved center bar and longitudinally-grooved horizontal bars attached thereto of conducting-wires arranged in the grooves of said bars and hooked wires in connection with the wires of the horizontal bars, substantially as set forth.

3. The improved rack, comprising a series of horizontal bars having longitudinal conducting-wires protected by insulation and thus prevented from coming into contact with the electrolytic fluid, of wire supports for the article to be plated, hooked onto said conducting-wires and in electrical contact therewith.

4. The improved plating-rack having a horizontal bar with a protected conducting-wire arranged longitudinally thereon, and a series of wire supports for the article to be plated, extending through said bar and at the side of said bar opposite the supporting extension of said wire hooked onto said conducting-wire the said wire-supports being in electrical contact with said conducting-wire, substantially as set forth.



811,876. RESAWING-MACHINE. CHARLES H. CLEVELAND, Fond du Lac, Wis. Filed Mar. 28, 1904. Serial No. 200,426.



Claim.—1. In a resawing-machine, the combination of a base; a fixed substantially horizontal bed supported thereon; a saw-carrying frame; a series of bell-crank levers pivotally connected to said frame and the base; and means for positively actuating and adjusting said levers in unison, whereby the frame may be raised and lowered uniformly.

2. In a resawing-machine, the combination of a base; a fixed substantially horizontal bed supported thereon; a saw-carrying frame; a series of bell-crank levers pivotally connected to each end of the frame and to the base; connections intermediate the free ends of said levers; and means for positively swinging said levers simultaneously, substantially as described.

3. In a resawing-machine, the combination of a base; a fixed substantially horizontal bed supported thereon; a saw-carrying frame; a series of bell-crank levers pivotally connected to each end of the frame and to the base; swivel-blocks carried by the depending ends of said levers; rods connecting the opposite blocks in pairs; means for swinging said levers; and means for maintaining the levers in their adjusted positions.

4. In a resawing-machine, the combination of a base; a fixed substantially horizontal bed carried thereby; a saw-carrying frame; a series of bell-crank levers pivotally connected to the frame and to the base; cross-rods connecting the opposite depending ends of said levers; a shaft mounted in the base; a series of arms carried by said shaft; rods c', c^2 connecting two of said arms to the cross-rods; and a rod c connecting a third arm with the depending arm of one of the bell-crank levers, substantially as described.

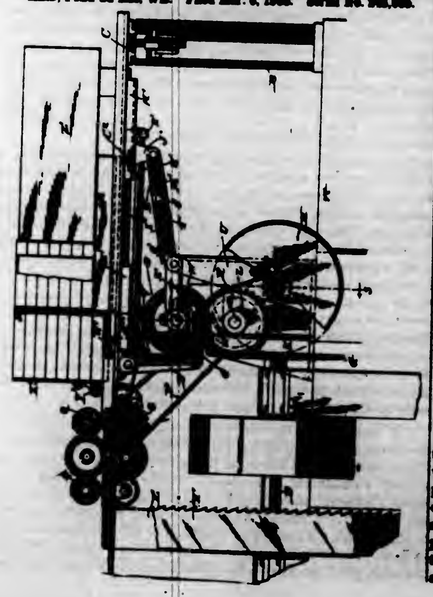
5. In a resawing-machine, the combination of a base; a fixed substantially horizontal bed carried thereby; a saw-carrying frame comprising members E, E connected together by a cross member F; a power-shaft mounted at one end of said frame; a band-wheel thereon; sliding arms mounted in the other ends of said members E, E; means for normally protruding said arms; a second band-wheel carried by the arms; a band-saw passing about the wheels and over the bed; bell-crank levers interposed between said carrying-frame and the base; connections intermediate said levers to cause them to move in unison; and means for adjusting said levers and maintaining them in their adjusted positions.

6. In a resawing-machine, the combination of a base; a fixed substantially horizontal bed carried thereby; feed-rolls working in line with said bed; supports extending above the bed, upon each side thereof; a shaft mounted in each pair of supports; a pair of arms fulcrumed on the shaft; a feed-roll carried by the arms; means for driving the feed-rolls; a saw-carrying frame; means for raising and lowering said frame; and means for maintaining the frame in its adjusted position.

7. In a resawing-machine, the combination of a base; a fixed bed mounted thereon; a movable saw-carrying frame; levers positively connecting different portions of said frame with said base; and means for directly shifting the position of said levers, whereby the frame will be positively and directly actuated, substantially as described.

8. In a resawing-machine, the combination of a base; a fixed bed mounted thereon; a movable saw-carrying frame; a lever system positively connecting said frame and base at each end of said base and frame; and means for actuating said lever system, whereby the frame will be positively and evenly raised or lowered throughout its length.

811,877. LUMBER-FEEDING MACHINE. CHARLES H. CLEVELAND, Fond du Lac, Wis. Filed Mar. 6, 1905. Serial No. 248,695.



Claim.—1. In a machine for feeding lumber, the combination of continuously-operating feed-rolls; a continuously-operating power device; a feed device arranged at a point in advance of the feed-rolls; and means controlled by the stock for throwing the feed device into operative relation with the power device, and for positively withdrawing the connection between said feed and power devices.

2. In a machine for feeding lumber, the combination of continuously-operating feed-rolls; a continuously-operating power device; a periodically-operated feed device arranged at a point in advance of the feed-rolls; and means controlled by the stock for throwing the lumber-feeding device into operative relation with the power device, and for positively withdrawing the connection between said feed and power devices.

3. In a machine for feeding lumber, the combination of a pair of continuously-operating feed-rolls; a continuously-operating power device; a periodically-operated lumber-feeding device arranged at a point in advance of the feed-rolls; and means interposed between the feed-rolls and lumber-feeding device, and controlled by the movement of the stock, for throwing said lumber-feeding device into operative relation with the power device.

4. In a machine for feeding lumber, the combination of continuously-operating means for presenting the lumber to a saw; a continuously-operating power device; a periodically-actuated lumber-feeding device arranged at a point in advance of the lumber-presenting means; and means interposed between the means for feeding the lumber to the saw and said lumber-feeding device for throwing the lumber-feeding device into operative connection with the power device, said means being controlled by the passage of the stock, substantially as described.

5. In a machine for feeding lumber, the combination of a continuously-operating feeding device for presenting the lumber to a saw; a hopper for containing the stock to be fed; a reciprocating push-bar working in line with the bottom of the hopper; means for moving said push-bar; and a stop device standing in the path of movement of the stock from the hopper to the feed device, said stop device serving to throw the actuating mechanism for the push-bar into and out of operation, substantially as described.

6. In a machine for feeding lumber, the combination of a hopper; a push-bar working in line with the lower portion thereof; means for actuating said push-bar, a stop device standing in line with the stock as it is pushed from the hopper and serving to throw the operative mechanism of the push-bar into and out of action, and a pair of continuously-operating feed-rolls arranged at a point beyond the hopper and designed to receive the stock which is removed therefrom by the push-bar.

7. In a machine for feeding lumber, the combination of a hopper; a push-bar working in line therewith; a constantly-operating power device; means for actuating the push-bar; means standing in the path of travel of the stock for throwing the push-bar-operating means into and out of contact with the power device; and a pair of continuously-operating feed-rolls arranged at a point beyond the hopper and designed to receive the stock which is removed therefrom by the push-bar.

8. In a machine for feeding lumber, the combination of a table; feed-rolls operating in line therewith; a hopper; a push-bar working in line with the hopper; a constantly-rotating power-wheel; a second power-wheel; a connection intermediate said second power-wheel and the push-bar; and means operated by the movement of the stock to raise and lower said second power-wheel into and out of operative relation with the first power-wheel.

9. In a machine for feeding lumber, the combination of a constantly-acting feed device; a hopper; a push-bar working in line with the hopper; means for advancing said push-bar at a speed greater than that of the travel of the feed device; and means for throwing the push-bar out of operation.

10. In a machine for feeding lumber, the combination of a saw; a lumber-feeding device; a hopper; a push-bar working in line therewith; means for reciprocating said push-bar; a yielding connection between the push-bar and said means; and means for throwing the push-bar into and out of operation.

11. In a machine for feeding lumber, the combination of continuously-operating feed-rolls; a hopper; a push-bar working in line with the hopper; a continuously-rotating power-wheel; a second power-wheel normally in operative relation with the first wheel; connections intermediate said second wheel and the push-bar; and a stop device standing in the path of travel of the lumber from the hopper to the feed-rolls, said stop device serving to bring the push-bar to rest when it has reached its limit of rearward travel, substantially as described.

12. In a machine for feeding lumber, the combination of continuously-operating feed-rolls; a hopper; a push-bar working in line with the hopper; a continuously-rotating power-wheel; a second power-wheel carried in movable bearings; connections intermediate said second power-wheel and the push-bar; a stop device located between the hopper and the feed-rolls; means for normally projecting said stop device into the path of travel of the stock from the hopper to the feed-rolls; and a cam rotating with the second power-wheel and acting in conjunction with the stop device to elevate said second power-wheel, whereby the push-bar is brought to rest, substantially as described.

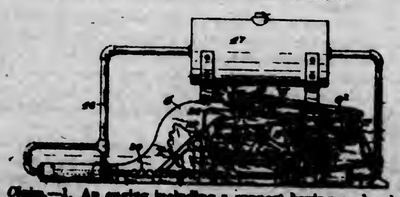
13. In a machine for feeding lumber, the combination of a hopper; a push-bar working in line therewith; a power-driven wheel; a second power-wheel movable into and out of contact with said first wheel; connections intermediate said second wheel and the push-bar; a bell-crank lever; a roller carried by the upper end of the bell-crank lever in line with the path of travel of the stock as it is forced out of the hopper; a slide pivotally connected to the lower end of the bell-crank lever, said slide having a beveled portion; a support for said slide; a cam rotatable with the second power-wheel; and means for throwing the free end of the bell-crank lever upwardly, whereby the slide will be normally withdrawn from beneath the cam, substantially as described.

14. In a machine for feeding lumber, the combination of a hopper; a push-bar working in line with the hopper; a constantly-rotating power-wheel; an upright or standard; a yoke or frame pivotally connected to said standard; a second power-wheel mounted in said yoke or frame; means for normally forcing said yoke or frame downwardly toward the first power-wheel; a cam rotatable with said second power-wheel; connections intermediate said wheel and the push-bar; a bell-crank lever; a roller carried by the free end of said bell-crank lever in line with the path of travel of the stock from the hopper; a slide secured to the lower end of the bell-crank lever and standing in the path of the cam; and means for normally projecting the upper end of the bell-crank lever into the path of travel of the stock.

15. In a machine for feeding lumber, the combination of a table having upstanding sides; a hopper arranged at one end thereof; a push-bar working in line with the lower end of said hopper; and an adjustable cross-bar secured in upstanding sides of the table in a plane above the push-bar.

16. In a machine for feeding lumber, the combination of a main table; a hopper mounted adjacent to one end thereof, said hopper comprising a fixed end, a fixed side, and an adjustable side; an auxiliary table mounted upon the main table and adjustable longitudinally thereon; a push-bar working in line with the lower portion of the hopper and passing beneath the auxiliary table when in its retracted position; and a cross-bar mounted in oppositely-disposed notches formed in the upstanding sides of the main table, said bar being located in front of the auxiliary table, substantially as described.

811,378. AIR-COMPRESSING ENGINE. HOMER R. CLIFFORD, Lafontaine, Ind. Filed Apr. 17, 1905. Serial No. 255,926.



Claim.—1. An engine including a support having a chamber therein, a hollow cylindrical abutment secured fixedly at an end thereof to the support in communication with the chamber thereof and provided at the opposite end thereof with a valve-seat, a valve operative on the valve-seat and having an operating-rod extending through the chamber of the support, a hollow cylinder movable on the abutment, a rotative shaft having a crank, operative connections between the hollow cylinder and the crank of the shaft, and connections between the rotative shaft and the operating-rod of the valve.

2. An engine including a frame, a support having a chamber therein, a hollow cylindrical abutment secured fixedly at an end thereof to the support in communication with the chamber thereof and provided at the opposite end thereof with a valve-seat, a valve operative on the valve-seat and having an operating-rod extending through the chamber of the support, means for controlling the operating-rod, a hollow cylinder movable on the abutment, a reciprocating rod mounted on the frame and having gear-teeth thereon, a gear-segment pivoted to the frame and engaging the gear-teeth of the reciprocating rod, and operative connections between the hollow cylinder and the gear-segment.

3. An engine including a frame, a support having a chamber therein, a hollow cylindrical abutment secured fixedly at an end thereof to the support in communication with the chamber thereof and provided at the opposite end thereof with a valve-seat, a valve operative on the valve-seat and having an operating-rod extending through the chamber of the support, a hollow cylinder movable on the abutment and provided with an exhaust-port, a rotative shaft having a crank and mounted on the frame, operative connections between the hollow cylinder and the crank of the rotative shaft, means for controlling the operating-rod of the valve, a pinion secured to the rotative shaft, a gear-wheel mounted on the frame in engagement with the pinion, a reciprocating rod mounted on the frame and having gear-teeth thereon, a gear-segment pivoted to the frame and engaging the gear-teeth of the reciprocating rod, and a coupling-rod pivoted to the gear-wheel and also to the gear-segment.

4. An engine including a support having a chamber therein, a hollow cylindrical abutment secured fixedly at an end thereof to the support in communication with the chamber thereof and provided at the opposite end thereof with a valve-seat, a valve operating on the valve-seat and having an operating-rod extending through the chamber of the support, a hollow cylinder movable on the abutment and having an exhaust-port therein, a working beam, a pair of connecting-rods pivoted to the cylinder and also to the working beam, a crank-shaft, a pitman connected to the crank of the shaft and also to the working beam, a balance-wheel on the crank-shaft, a rocking arm attached to the valve-operating rod, and connections between the crank-shaft and the rocking arm.

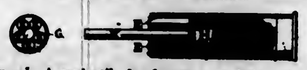
5. An engine including stationary hollow abutments provided with valves having operating-rods extending through ends thereof, rocking arms secured to the operating-rods of the valves, hollow cylinders movable on the abutments and provided with exhaust-ports, pivoted working beams, connecting-rods pivoted to the cylinders and also to the working beams, guides for the cylinders, a main shaft having cranks, connecting-rods pivoted to the cranks and also to the working beams, a pair of rotative shafts provided with cams, gearing between the rotative shafts and the main shaft, swinging arms movable between and by the cams of the pair of rotative shafts, and connecting-rods pivoted to the swinging arms and also to the rocking arms.

6. An air-compressing engine including a frame, a plurality of pairs of parallel guides supported by the frame, a plurality of hollow cylinders movable in the pairs of guides and having each a closed end and an open end, a plurality of working beams pivoted on the frame, a plurality of connecting-rods pivoted to the cylinders in pairs and also to the working beams, a plurality of hollow abutments supported by the frame and extending therefrom into the movable cylinders and provided each with two parallel apertured valve-seats, main apertured valves movable between the seats and having operating-rods extending through the abutments, a main shaft having a plurality of cranks mounted on the frame, and connecting-rods pivoted to the cranks and also to the working beams.

7. An air-compressing engine including a frame, a plurality of cylinders mounted movably in the frame, a plurality of abutments serving as fluid-chambers supported at ends thereof by the frame and extending into the cylinders, main valves mounted in the ends of the abutments within the cylinders and having operating-rods extending through the abutments, rocking arms secured to the operating-rods, a plurality of working beams pivoted on the frame, a main crank-shaft journaled on the frame, coupling-rods pivoted in pairs to the cylinders and also to the working beams, coupling-rods pivoted to the cranks of the main shaft and also to the working beams, reciprocating rods mounted on the frame and having gear-teeth thereon, gear-segments pivoted to the frame and engaging the gear-teeth of the reciprocating rods, operating-gearing between the gear-segments and the main shaft, and operating mechanism between the main shaft and the rocking arms of the valve-rods.

8. In an engine, the combination of a frame, a pair of guides in the frame, a cylinder closed at one end thereof mounted movably between the guides and having an exhaust-port near the opposite end thereof, a chambered pillar attached to the frame, a hollow cylindrical abutment attached to the pillar and extending into the cylinder, a main valve movably mounted in the end of the abutment that is in the cylinder, a packing between the end of the abutment and the cylinder, a working beam mounted on the frame, a pair of parallel connecting-rods pivoted to the cylinder and extending at opposite sides of the pillar to the working beam and pivoted thereto, and means for operating the main valve.

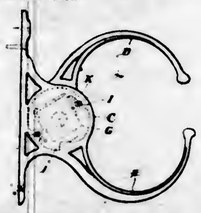
811,379. FIREARM-CARTRIDGE. FRANK B. CLOTT, Menominee, Mich. Filed Apr. 20, 1905. Serial No. 256,010.



Claim.—1. A projectile for firearms consisting of several bullets incased in a metallic case and embedded in wax and having a central air-passage from front to rear, substantially as shown for the purpose specified.

2. The combination in a metallic cartridge of a projectile having several bullets inclosed in a metallic case and embedded in wax and a central air-passage from front to rear, with a metallic case charged with powder and provided with a cap as now commonly used, all substantially as set forth.

811,380. COAT AND HAT HOOK. HORATIO B. COLLINS, Detroit, Mich., assignor of one-half to J. H. Harrison, Detroit, Mich. Filed Aug. 19, 1905. Serial No. 274,849.



Claim.—1. In a device of the character described, the combination of a fixed hook member adapted to be secured to the wall and provided with an enlargement at the base of the hook forming a casing, of a pivotal arm carried by the hook member and provided with an apertured enlargement at its inner end forming the cover for said casing, means rotatively connecting said cover to the casing, a lock of the character described inclosed in the casing and rotatively carried by the pivotal arm and a projection in the wall of the casing adapted to coöperate with the lock.

2. In a device of the character described, the combination of a fixed hook member integrally formed with a circular enlargement forming a casing, a pivotal arm carried by the hook and integrally formed with an enlargement forming a cover for the casing of the hook, means rotatively connecting said cover to the casing, a lock complete in itself loosely inclosed within the casing and rotatively held therein by suitable connection with the cover whereby the operation of the key is adapted to operate the lock and oscillate the arm, and a locking projection on the inner wall of the casing coöperating with the lock.

811,381. CORD-FASTENER. EDGAR M. COMSTOCK, Ypsilanti, Mich. Filed Feb. 1, 1904. Serial No. 191,482.

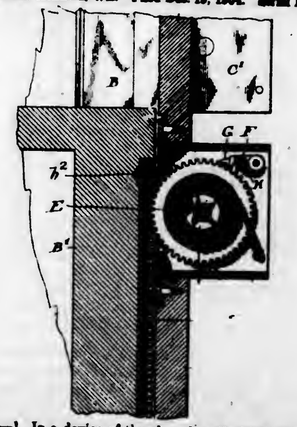
Claim.—1. A device for securing the end of a cord comprising a resilient elliptical frame provided with a cross-bar, a portion of said elliptical frame being opposite thereto, a tongue extending from said cross-bar toward said opposite portion of the frame, and similarly resilient with respect thereto said tongue being provided at its free end with means for attaching a cord thereto, and a belaying-tongue secured to said frame, substantially as described.

2. A device for securing the end of a cord comprising a resilient elliptical frame having a cross-bar, a portion of the curved part of the frame being opposite the cross-bar, a resilient tongue projecting from one side of said cross-bar toward the curved portion of the frame opposite thereto, said resilient tongue being provided at its free end with means whereby a cord may be attached thereto, and a tongue projecting from the other side of said cross-bar and at an angle to the plane of the cross-bar and frame, adapted to clamp a cord interposed therebetween and said frame, substantially as described.

3. A device for securing the end of a cord, comprising a resilient elliptical frame having a cross-bar and spring-tongues projecting from each side of each cross-bar toward that portion of the elliptical frame opposite thereto, one of said tongues having at its free end means for attaching a cord thereto, and the other of said tongues being adapted to clamp and hold against the frame a portion of the cord interposed therebetween, substantially as described.

4. In a cord-fastener, the combination of a resilient elliptical frame and a tongue part connected and integral with a portion of said frame, the free end of said tongue part extending across said frame and toward the opposite portion thereof to that with which it is connected, and being resilient with respect to said frame, there being at the free end of said tongue part means whereby a cord may be attached thereto, substantially as described.

811,382. COMBINED SASH-BALANCE AND LOCK. JOHN H. CORCORAN, Kenosha, Wis. Filed Dec. 19, 1904. Serial No. 237,267.



Claim.—1. In a device of the class described, the combination with a window and sash, of a rack-bar on one side of the sash, a pinion in engagement with said rack-bar, a pawl engaging the teeth of the pinion, a wedge engaging the pawl to disengage it from the pinion having a flange upon its outer end, a spring engaging said flange and adapted to normally hold the wedge out of engagement with the pawl, a push-button threaded on said wedge and a collar threaded upon said push-button and adapted to limit the outward movement thereof.

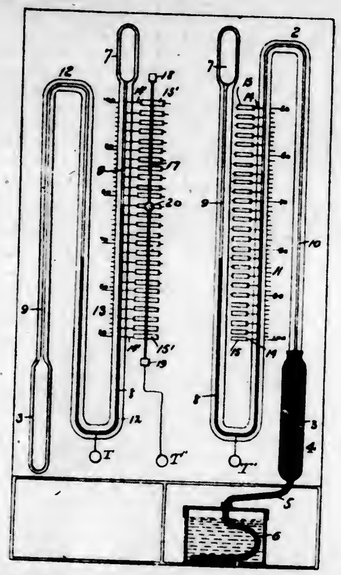
2. In a device of the class described, the combination with a window, sash, and a rack-bar mounted on one edge thereof, of a lock-casing, a pinion journaled therein and in mesh with said rack-bar, a spring upon said pinion tending to raise the sash, a pawl pivoted on the casing and capable of engagement with the pinion to prevent rotation thereof in one direction when hung in a substantially horizontal plane, and adapted to prevent reverse rotation of the pinion when hung in a substantially vertical plane, a wedge adapted to coact with the pawl when hung in either position to throw the same out of engagement with the pinion and two openings in the casing arranged to guide said wedge in either position with respect to the pawl.

811,383. HYGROMETER FOR REGULATING HUMIDIFYING AND HEATING SYSTEMS. STUART W. CRAMER, Charlotte, N. C. Filed Dec. 26, 1904. Serial No. 238,696.

Claim.—1. The combination with a source of electrical energy, of means for indicating temperature and means for indicating humidity, each of the means being adapted to close an electric circuit, separate electrical conductors connecting said source of electrical energy with each of said means, one of said conductors including an electromagnetic device, a plurality of electrical conductors connecting said means, each of said latter conductors uniting selected points on the indicating means.

2. The combination with a source of electrical energy, of a dry-bulb thermometer and a wet-bulb thermometer, each of said ther-

meters being adapted to close an electric circuit, separate electrical conductors connecting said source of electrical energy with each of said thermometers, one of the said conductors including an electromagnetic device, a plurality of electrical conductors connecting said thermometers, each of said latter conductors uniting a selected point on the dry-bulb thermometer with a selected point on the wet-bulb thermometer.



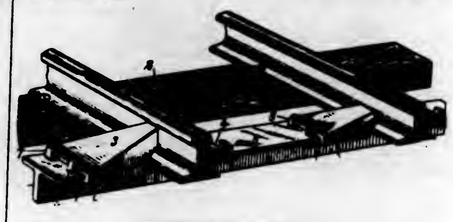
3. The combination with a source of electrical energy, of means for regulating and indicating temperature and means for regulating and indicating humidity, each of said means being adapted to close an electric circuit, separate electrical conductors connecting said source of electrical energy with each of said means, each of said conductors including an electromagnetic device, a plurality of electrical conductors connecting said means, each of said latter conductors uniting selected points on the means for indicating temperature and humidity, and an electrical conductor leading from said source of electrical energy and adapted to be placed in communication with any one of said latter conductors.

4. The combination with a source of electrical energy, of a dry-bulb thermometer and a wet-bulb thermometer, each of said thermometers being adapted to close an electric circuit, separate electrical conductors connecting said source of electrical energy with each of said thermometers, each of said conductors including an electromagnetic device, a plurality of electrical conductors connecting said thermometers, each of said latter conductors uniting selected points on the dry-bulb thermometer with selected points on the wet-bulb thermometer, and an electrical conductor leading from said source of electrical energy and adapted to be placed in communication with any one of said latter conductors.

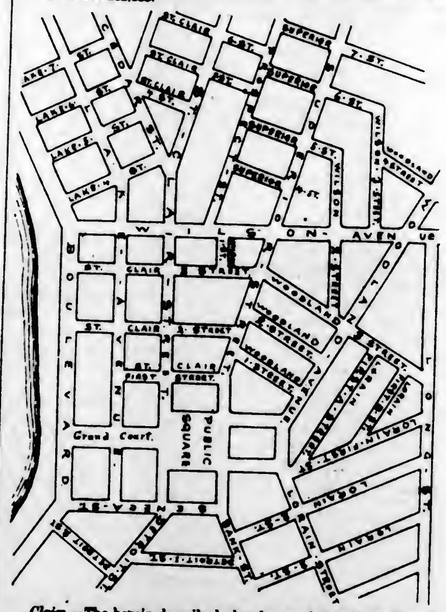
5. The combination with a source of electrical energy, of a dry-bulb thermometer and a wet-bulb thermometer, each of said thermometers being adapted to close an electric circuit, separate electrical conductors connecting said source of electrical energy with each of said thermometers, each of said conductors including an electromagnetic device, a plurality of electrical conductors connecting said thermometers, each of said latter conductors uniting a selected point on the dry-bulb thermometer with a selected point on the wet-bulb thermometer, the thermometers being constructed and arranged so that the circuit-closing ends of the mercurial columns move in opposite directions under the influence of a change in temperature, and an electrical conductor leading from said source of electrical energy and adapted to be placed in communication with any one of said latter conductors.

811,384. RAILWAY-TRACK GAGE AND BRACE. JOHN H. CROWLEY, Duluth, Minn. Filed June 20, 1905. Serial No. 265,516.

Claim.—A railway-track gage comprising a T-bar having openings in its flanges, a clip having flange portions for engaging around the flanges of the bar, the said clips being angular and bearing only upon the base-flange of the rail, and wedges passing through the openings in the bar-flanges for forcing the clips into engagement with the rail-base.



811,385. PLAN FOR NUMBERING STREETS IN IRREGULAR CITIES. FRANK H. CUSHEL, Cleveland, Ohio. Filed June 14, 1904. Serial No. 212,823.



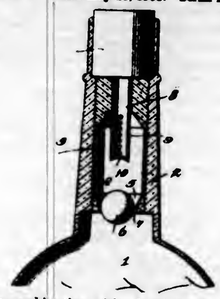
Claim.—The herein-described plan for naming and numbering streets in irregular cities, consisting in naming the main or trunk line streets, and giving to the branch or cross streets, the same name as the main-line streets, with the addition of numbers, substantially as described.

811,386. IMPLEMENT FOR DECORATING WOOD. ROSS A. CULVER, Bristol, Conn. Filed Sept. 26, 1904. Serial No. 226,231.

Claim.—1. The herein-described implement for decorating woodwork, consisting of a depth-gage the face of which acts as a step, and a series of short and stout pins projecting from the said face and arranged together to delineate the design to be impressed in the wood, the depth and size of the impressions being governed by the said step-face.

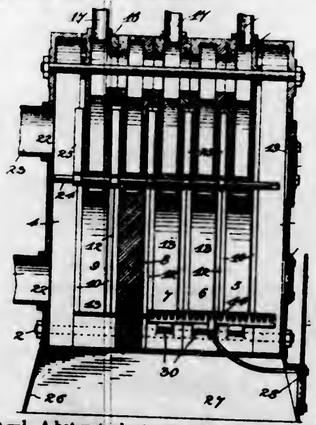
2. The herein-described implement for decorating woodwork, consisting of a depth-gage having a series of cylindrical holes and a stop-face, and a series of pins arranged together to delineate the design to be impressed in the wood, the said pins having a cylindrical portion fitted to the said cylindrical holes and a short and stout pointed portion at the front end of the said cylindrical portion, the said pins being arranged with the junction of the cylindrical and pointed portions in the plane of the said stop-face.

811,387. NON-REFILLABLE BOTTLE. WILLIAM H. DARR, Whitestone, N. Y. Filed May 29, 1905. Serial No. 262,601.



Claim.—The combination with a bottle having a neck, of a casing seated in the latter and provided with an internal chamber having an inlet-opening and a valve-seat surrounding said opening, a tubular shield entered through the normally upper end of the casing and projected into said chamber, the tube having its side walls perforated within the chamber and its inner end closed and concaved to receive the valve and the casing having its upper end walls convergently inclined for directing liquid toward the tube, and a valve movably disposed in the chamber and adapted to normally rest upon said seat.

811,388. WATER-HEATER. JOHN W. DENNEAD, Akron, Ohio, assignor to Ernest C. Prince and Charles C. Patterson, Barberton, Ohio. Filed Apr. 20, 1905. Serial No. 256,560.



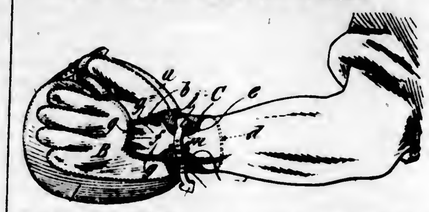
Claim.—1. A hot-water heater comprising a plurality of hollow separable sections having transverse flues formed between them, and revoluble means to clean said flues.

2. A hot-water heater comprising a plurality of hollow separable sections having transverse flues formed between them, and revoluble means to simultaneously clean said flues.

3. A hot-water heater consisting of a front section having arranged therein a feed-opening and a clean-out opening, a rear section having arranged therein a smoke-outlet passage, intermediate sections having smoke-passages arranged to form a fire-box, smoke-flues formed between said sections, a longitudinally-disposed shaft, mounted in said sections, brush-arms secured to said shaft in each of said smoke-flues, means whereby said shaft may be turned to actuate said brush-arms and clean said smoke-flues, manifolds arranged at the upper and lower ends of said sections, flow-pipes connected with said upper manifolds and return-pipes connected with the lower manifolds, substantially as described.

4. A hot-water heater comprising a plurality of hollow separable sections having transverse flues formed between them, and a revoluble shaft having its bearings in said separable sections, and arms on said shaft to operate in and clean the flues when said shaft is rotated.

811,389. BALL-PLAYER'S MITT. ARTHUR C. FERRY, Chicopee Falls, Mass. Filed June 21, 1905. Serial No. 265,291.



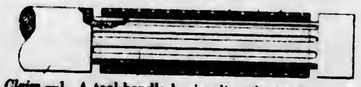
Claim.—1. A ball-player's mitt, comprising a pad, thumb and finger receiving means secured to the rear face of the pad and lying wholly within the marginal edge thereof, and a rearwardly-extending wrist-encircling band secured at one end to the pad within the marginal edge thereof and in rear of the thumb and finger receiving means.

2. A ball-player's mitt comprising a pad, thumb and finger receiving means secured to the rear face of the pad and lying wholly within the marginal edge thereof, a rearwardly-extending wrist-encircling band secured at one end to the pad within the marginal edge thereof and in rear of the thumb and finger receiving means, and detachable means for confining said band about the wrist.

3. A ball-player's mitt comprising a pad, thumb and finger receiving means secured to the rear face of the pad and lying wholly within the marginal edge thereof, and a rearwardly-extending wrist-encircling band secured at one end to the pad within the marginal edge thereof and also secured to the thumb and finger receiving means.

4. A ball-player's mitt comprising a pad, thumb and finger receiving means secured to the rear face of the pad and lying wholly within the marginal edge thereof, a rearwardly-extending wrist-encircling band secured at one end to the pad within the marginal edge thereof, and also secured to the thumb and finger receiving means, and detachable means for the confinement of said band about the wrist.

811,390. TOOL-HANDLE. SAMUEL B. FOREMAN, Paducah, Ky. Filed Apr. 26, 1905. Serial No. 257,227.



Claim.—1. A tool-handle having its grip portion circumferentially reduced and provided with channels, and an orificed grip encircling the reduced portion.

2. A tool-handle having its grip portion circumferentially reduced and provided with longitudinal channels extending throughout the length of the reduced portion, and an orificed grip encircling the said portion.

3. A tool-handle having its grip portion circumferentially reduced and scored or roughened and provided with longitudinal channels, and an orificed grip encircling the reduced portion.

4. A tool-handle having its grip portion circumferentially reduced and provided with longitudinal channels, and an orificed grip encircling the reduced portion and of less length than the same.

5. A tool-handle having its grip portion circumferentially reduced and longitudinally channeled, and a corrugated orificed grip encircling the reduced portion.

811,391. DRIVE-CHAIN. WILLIAM H. GATES, Worcester, Mass. Filed May 14, 1903. Serial No. 157,926.

Claim.—1. In a drive-chain, the combination with center links adapted to engage the teeth of a sprocket-wheel, of a pair of side links capable of longitudinal movement, a pivotal pin permanently attached to each side link on opposite ends, means for engaging and

disengaging the free ends of said pins in the side links by the separation and approach of links on the same side of the chain, and means for preventing said approach when the chain is in use.

2. In a drive-chain, the combination with center links adapted to engage a sprocket-wheel, of a pair of side links capable of longitudinal movement, a pivotal pin permanently attached to each side link on opposite ends, the free ends of said pins having necks adapted, after said pins have entered holes in said side links, to be drawn by the separation of the side links into slots communicating with said holes, and means for preventing the approach of the links on the same side of the chain and the consequent return of said pins into said holes when the chain is in use.

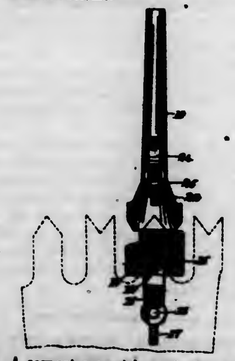
3. In a drive-chain, the combination with center links adapted to engage the teeth of a sprocket-wheel, of a pair of side links capable of longitudinal movement, a pivotal pin permanently attached to each side link on opposite ends, means for engaging and disengaging the free ends of said pins in said side link by the separation and approach of links on the same side of the chain and a locking-plate, whereby said links are held from such approach.

4. In a drive-chain, the combination with center links adapted to engage a sprocket-wheel, of a pair of side links capable of longitudinal movement, a pivotal pin permanently attached to each side link on opposite ends, the free ends of said pins having necks adapted, after the pins have entered holes in said side links, to be drawn by the separation of the side links into slots communicating with said holes, and a locking-plate whereby the links on the same side of the chain are held from longitudinal movement toward each other.

5. In a drive-chain, the combination with center links, of a pair of side links provided at both ends with holes and communicating slots, pivotal pins connecting the ends of said side links, said pins having flattened necks entering said holes and drawn into said slots by separation of the adjacent side links, and a locking plate having a forked end to inclose said neck, and an inwardly-turned prong engaging the wall of the opening in the side link, whereby the relative movement of pivotal pins and side links is prevented.

6. In a drive-chain, the combination with center links adapted to engage a sprocket-wheel, of a pair of side links capable of longitudinal movement, a pivotal pin permanently attached to each side link on opposite ends, the free ends of said pins having necks adapted, after said pins have entered holes in said side links, to be drawn into slots communicating with said holes, and locking-plates having forked ends to inclose said neck and inwardly-turned prongs to engage the walls of said holes in said side links, whereby the relative movement of said pivotal pins and said side links is prevented.

811,892. SAW-SET. PETER A. GIANERA, Gualala, Cal. Filed July 12, 1905. Serial No. 269,689.



Claim.—1. A saw-set comprising a body, an anvil-plate provided with a vertical slot, a wedge acting between the body and the anvil-plate and provided with an inclined slot, a screw traversing the slot in the anvil-plate and the wedge, and a die connected with the body for cooperating with the anvil-plate.

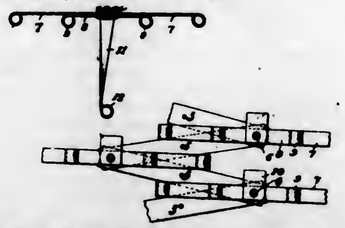
2. A saw-set having a body, an anvil-plate having an inclined edge thereon, a die for cooperating with the anvil-plate, means for adjusting the anvil-plate longitudinally of the body, comprising a wedge acting between the body and the inclined edge of the anvil-plate, and means for movably securing the anvil-plate and the wedge to the body.

3. A saw-set comprising a body having an anvil connected therewith, a yoke encircling the body, a tubular arm projecting from the yoke, a die mounted on the tubular arm, and means for adjusting the die.

4. A saw-set comprising a body having an anvil connected therewith, a yoke encircling the body, a tubular arm projecting from the yoke, a die mounted on the tubular arm, and means for adjusting the die, said means comprising a screw threaded in the tubular arm and engaging the end of the arm.

5. A saw-set having a body, an anvil-plate thereon having inclined outer surface at its upper end, a die for cooperating with the inclined surface of the anvil-plate, means for adjusting the die to and from the inclined surface of the anvil-plate, and means for adjusting the anvil-plate longitudinally of the body.

811,893. DECORATING DEVICE. JOSEPH GRUBER, Newark, N. J. Filed Nov. 14, 1905. Serial No. 287,281.



Claim.—1. The combination with a series of pivotally-connected longitudinal strips, of transverse strips secured to said longitudinal strips by the rivets which hold the longitudinal strips together, the transverse pieces being provided at their outer extremities with curls forming receptacles, substantially as set forth.

2. The combination with the pivotally-connected longitudinally-disposed strips, and transverse strips having flower-receptacles at their outer extremities, of forwardly-projecting arms detachably secured to the longitudinally-disposed strips.

3. The combination with the longitudinal strips having a folding relation one with the other, of transverse strips curled at their outer extremities, and forwardly-projecting flower-holding arms separably attached to the longitudinal strips, substantially as set forth.

4. The combination with the longitudinal strips pivotally secured together, of long and short transverse strips having receptacles for decorative articles at their opposite projecting extremities, substantially as set forth.

811,894. TYPE-CLEANING DEVICE FOR TYPE-WRITING MACHINES. SAMUEL B. HALSEY, Everett, Wash. Filed Mar. 24, 1905. Serial No. 251,236.

Claim.—1. A type-cleaning device for type-writing machines consisting of a brush, a shaft upon which said brush is secured, and means slidably engaging the shaft for alternately rotating said shaft said means also causing an axial movement of said shaft.

2. A type-cleaning device for type-writing machines, consisting of a casing, means projecting from said casing to engage and push away the ink-ribbon from the path of the type-heads, a brush within said casing, a shaft upon which said brush is rigidly mounted, and means engaging the shaft for imparting a reciprocal rotary movement of said shaft.

3. A type-cleaning device for type-writing machines consisting of a casing, means projecting from said casing, adapted to engage and push away the ink-ribbon from the path of the type-bar heads, a brush within said casing, a spirally-grooved shaft mounted in said casing and carrying said brush, a guide-bar extending forwardly from said casing and supporting the spirally-grooved shaft at its front end, a spirally-bored nut fitting said shaft and engaging the guide-bar, whereby a longitudinal reciprocating movement of the nut on said shaft will cause a reciprocal rotary movement of the brush.

4. A type-cleaning device for type-writing machines consisting of a casing, a spirally-grooved shaft mounted in said casing and extending through the front wall thereof, a brush rigidly mounted on said shaft within the casing, a guide-bar extending forwardly from the front wall of said casing adjacent to the spirally-grooved shaft, and having near its front end a bent portion supporting the front end of the shaft, a spirally-threaded nut mounted on the shaft and engaging the guide-bar, a spring held between the nut and the support of the front end of shaft, a hook at one end of the guide-bar adapted to engage the guide-rail of the type-writing machine, and means for reciprocating the nut on the shaft causing a reciprocal rotary movement of the brush.

5. A type-cleaning device for type-writing machines consisting of a casing having an elongated slot in its lower wall, a removable rear wall, a spirally-grooved shaft mounted in said casing and extending through the front wall thereof, a brush rigidly secured to said shaft near its rear end, a guide-bar extending forwardly from the front wall of said casing adjacent to the spirally-grooved shaft, said guide-bar being bent near its front end downwardly then upwardly and having a hooked front end, said downwardly-bent portion having an opening through which the forward end of the spirally-grooved shaft passes, a spirally-threaded nut mounted on said shaft and snugly fitting the same, and means for reciprocating the nut to first cause an axial movement of the shaft and then a rotary movement of the same.

6. A type-cleaning device for type-writing machines consisting of a brush, a shaft to which said brush is secured, said shaft having a spiral groove of rapid pitch, a frame in which said shaft is mounted to rotate and also reciprocate longitudinally, and a spirally-bored nut adapted to fit the shaft snugly, whereby longitudinal movement of the nut will cause the shaft to reciprocate longitudinally and to rotate.

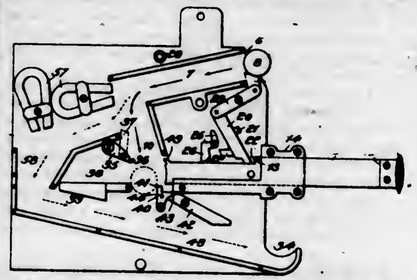
7. A type-cleaning device for type-writing machines consisting of a casing, a brush within said casing, a shaft mounted in said casing and carrying said brush, an extensible guide-bar extending from said casing, and supporting the shaft at its end, a nut slidably fitting said shaft and engaging the guide-bar, said shaft and nut being provided with coacting instrumentalities whereby a longitudinal reciprocating movement of the nut on the shaft will cause a reciprocal rotary movement of the brush.

8. A type-cleaning device for type-writing machines, consisting of a casing, a spirally-grooved shaft mounted in said casing and extending through the front wall thereof, a brush rigidly mounted on said shaft within the casing, a guide-bar extending forwardly from the front wall of said casing adjacent to the spirally-grooved shaft and having at or near its front end a bent portion supporting the front end of the shaft, a spirally-threaded nut mounted on said shaft, a hook at one end of the guide-bar adapted to engage the guide-rail of the type-writing machine, and means for reciprocating the nut on the shaft to cause a reciprocal rotary movement of the brush.

9. A type-cleaning device for type-writing machines, consisting of a casing, a spirally-grooved shaft mounted in said casing and extending through the front wall thereof, a brush rigidly mounted on said shaft within the casing, a guide-bar extending forwardly from the front wall of said casing adjacent to the spirally-grooved shaft and having at or near its front end a bent portion supporting the front end of the shaft and permitting longitudinal play thereof, a spirally-threaded nut mounted on said shaft, and means for reciprocating the nut on the shaft causing reciprocating movement of the shaft and a reciprocal rotary movement of the shaft and brush.

811,895. FRAUD-PREVENTIVE MECHANISM FOR CIGAR-VENDING MACHINES. JOHN HENDRICH, JOHN SCHMIDT, and CARROLL L. BYINGTON, Kansas City, Mo. Original application filed Nov. 24, 1904, Serial No. 234,603. Divided and this application filed Apr. 3, 1905. Serial No. 253,434.

Claim.—1. In a coin-actuated mechanism for vending-machines, means for preventing the use of lead disks to actuate the machine comprising a plunger, coin-controlled locking means therefor, a dog pivotally mounted in the path of the plunger and adapted to impale said lead disk, a latch pivoted in the path of said lead disk below the plunger, a weighted dog automatically maintaining said latch as a rest for the lead disk, and means connecting the plunger and said latch whereby the retracting movement of the plunger pulls the latch from under the lead disk for the purpose stated.

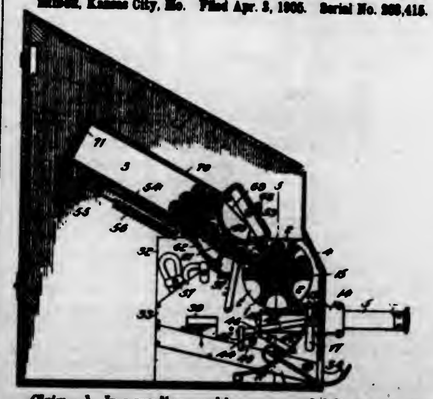


2. In a coin-controlled mechanism for vending-machines, mechanism for preventing the use of lead disks to actuate the machine comprising a plunger, coin-controlled locking mechanism therefor, a dog pivotally mounted in the path of the plunger and adapted to impale said lead disk, a latch pivoted in the path of said lead disk below the plunger as a rest for the lead disk, a weighted dog to automatically maintain said latch in its position as a rest, an arm pivotally mounted on the plunger and adapted to engage said latch whereby it is tripped from its supporting position by the retracting position of the plunger.

3. In a coin-controlled mechanism for vending-machines, a plunger, a coin-controlled locking device therefor a dog pivotally mounted in the path of the plunger and adapted to impale said lead disk, a latch pivoted in the path of the lead disk below the plunger as a rest for the lead disk, a weighted dog automatically maintaining said latch in its position as a rest, the said disk lead being impaled on the dog by the forward movement of the plunger and the said latch tripped by the retracting movement of the plunger, and means connecting the plunger and latch for effecting the tripping of the latter.

4. In a coin-controlled mechanism for vending-machines, a plunger, means automatically locking the plunger in its normal position, means controlled by the coin to automatically release said lock and to maintain such release, means automatically to trip said locking device from its released position by the inward movement of the plunger, a pivoted coin-support below the path of the plunger, means automatically maintaining said support, and means automatically releasing said support by the outward movement of the plunger for the purpose stated.

811,896. MECHANISM FOR FEEDING CIGARS IN VENDING-MACHINES. JOHN HENDRICH, JOHN SCHMIDT, and CARROLL L. BYINGTON, Kansas City, Mo. Filed Apr. 3, 1905. Serial No. 253,415.



Claim.—1. In a vending-machine, a grooved delivery-cylinder, a supply-receptacle, a chute for the articles, a cylindrical feed device arranged above the chute and overhanging the grooved cylinder, means for causing said cylinder to rotate in one direction only, and means for causing the feed device to have movements in reverse directions upon the cigars above the cylinder.

2. In a vending-machine, a grooved delivery-cylinder, a supply-receptacle, a chute for the articles, a feed device arranged above the chute and overhanging the grooved cylinder and comprising a pair of heads or arcs each having a yielding feeding-surface, means for causing said cylinder to rotate in one direction only, and means for causing the feed device to have movements in reverse directions upon the cigars above the cylinder.

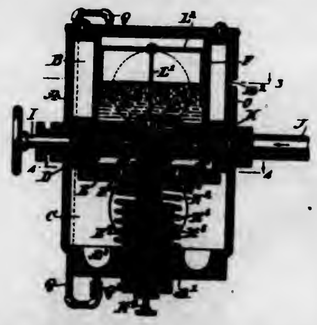
3. In a vending-machine, a revoluble delivery-cylinder having a plurality of longitudinal grooves, a supply-receptacle, for the articles, a concave chute for delivering the articles into said grooves, a shaft mounted above and in vertical line with the front of said cylinder, a pair of heads or arcs mounted on said shaft, forming feeding-surfaces and overhanging said chute, means actuated by said cylinder for causing said heads to have an upward rolling movement upon the cigars, and means for causing said heads to have a sudden and positive reverse or downward feed movement to place a cigar in a groove.

4. In a vending-machine, a revoluble delivery-cylinder having a plurality of longitudinal grooves, a supply-receptacle for the articles, a chute for delivering the articles into said grooves, a shaft mounted above the cylinder, a pair of heads or arcs mounted on said shaft and forming feeding-surfaces, means actuated by said cylinder for causing said heads to have an up-and-down rolling feed movement upon the cigars in their delivery to said cylinder, means whereby the down movement is positively controlled to place a cigar in a groove, and means for slidably adjusting said heads toward and from each other on said shaft.

5. In a vending-machine, a supply-receptacle for the articles, a revoluble delivery-cylinder having a plurality of longitudinal grooves, a feeder device mounted above the cylinder, and means for oscillating or rocking said feed device consisting of a ratchet-wheel carried by said cylinder, a ratchet-arm engaging the teeth of said wheel, an arm fixed to said rocking-feeder device engaging the ratchet-arm, and a spring connecting the feeder-arm for maintaining it in contact with said ratchet-arm and the latter in contact with said ratchet-wheel, whereby the rotation of the cylinder causes the oscillating or rocking movement of the feeder device to feed the articles into the grooves and to agitate the supply.

6. In a vending-machine and in combination with a revoluble cylinder having a plurality of longitudinal grooves, a supply-receptacle for the articles, a chute for delivering the articles to said grooves, an oscillating or rocking feed device mounted above the chute and the cylinder, and a plurality of fingers or wires mounted on the box and lying upon the articles for the purpose stated.

811,397. **VAPORIZER.** CHARLES HIBBARD and WARREN HIBBARD, Sandyhill, N. Y., assignors to Hibbard Gas Engine Co., Sandyhill, N. Y. Filed Nov. 15, 1904. Serial No. 232,837.



Claim.—1. A vaporizer for explosion-engines comprising a vessel for containing the liquid fuel and having an outlet, an air-chamber surrounding the said vessel and having a valve-port and a valve-seat, a mixing-chamber connected with the working chamber of the engine and into which open the said port of the air-chamber and the said outlet of the vessel, an air-valve controlling the said valve-port and adapted to be opened by the suction action of the engine, and a liquid-fuel valve for the said outlet of the vessel, opened by the said air-valve after the latter has moved off its seat, and closing previous to the air-valve moving to its seat.

2. A vaporizer for explosion-engines comprising a vessel for containing the liquid fuel and having an outlet, an air-chamber surrounding said vessel and having a valve-port and a valve-seat, a mixing-chamber connected with the working chamber of the engine and into which open the said port and the said outlet, an air-valve controlling the said valve-port and adapted to be opened by the suction action of the engine, a liquid-fuel valve for the said outlet, opened by the said air-valve after the latter has moved off its seat, and closing previous to the air-valve moving to its seat, a spring for holding the said air-valve to its seat, and a spring for holding the said liquid-fuel valve to its seat.

3. A vaporizer for explosion-engines comprising a vessel for containing the liquid fuel and having an outlet, an air-chamber surrounding the said vessel and having a valve-port and a valve-seat, a mixing-chamber connected with the working chamber of the engine and into which open the said port and the said outlet, an air-valve controlling the said valve-port and adapted to be opened by the suction action of the engine, a liquid-fuel valve for the said outlet, opened by the said air-valve after the latter has moved off its seat, and closing previous to the air-valve moving to its seat, a spring for holding the said air-valve to its seat, a spring for holding the said liquid-fuel valve to its seat, and means for adjusting the tension of the spring for the said liquid-fuel valve.

4. A vaporizer for explosion-engines comprising a vessel for containing the liquid fuel and having an outlet, an air-chamber having a valve-port and a valve-seat, a mixing-chamber connected with the working chamber of the engine and into which open the said port and the said outlet, an air-valve controlling the said valve-port and adapted to be opened by the suction action of the engine, a liquid-fuel valve for the said outlet, opened by the said air-valve after the latter has moved off its seat, and closing previous to the air-valve moving to its seat, and a connection leading from the said mixing-chamber to the said vessel, to force any non-vaporized liquid fuel that passes into the mixing-chamber back into the said vessel by pressure from the engine on the return stroke of the engine-piston.

5. A vaporizer for explosion-engines comprising a vessel for containing the liquid fuel and having an outlet, an air-chamber surrounding said vessel and having a valve-port and a valve-seat, a mixing-chamber connected with the working chamber of the engine and into which open the said port and the said outlet, an air-valve controlling the said valve-port and adapted to be opened by the suction action of the engine, a liquid-fuel valve for the said outlet, opened by the said air-valve after the latter has moved off its seat, and closing previous to the air-valve moving to its seat, a liquid-fuel supply for the said vessel, a supply-valve in the said supply, and a float in the said vessel, connected with the said supply-valve to maintain a uniform level of the liquid fuel in the said vessel.

6. A vaporizer for explosion-engines provided with a vessel for containing liquid fuel, an air-chamber surrounding the said vessel, a mixing-chamber into which open the said vessel and the said air-chamber, and valves controlling the connections between the said mixing-chamber and the said air-chamber and vessel.

7. A vaporizer for explosion-engines provided with a vessel for containing liquid fuel and having an outlet at its bottom, an air-chamber having a valve-seat around the said outlet, an air-valve having a ring-shaped leather valve adapted to be seated on the said seat, and a liquid-fuel valve having a disk leather valve adapted to be seated on the said outlet, the said disk leather valve being arranged within the opening of the said ring-shaped leather valve.

8. A vaporizer for explosion-engines provided with a vessel for containing liquid fuel and having an outlet at its bottom, an air-chamber having a valve-seat around the said outlet, an air-valve having a ring-shaped leather valve adapted to be seated on the said seat, and a liquid-fuel valve having a disk leather valve adapted to be seated on the said outlet, the said disk leather valve being arranged within the opening of the said ring-shaped leather valve, the said air-valve and the said liquid-fuel valve having spring-pressed metallic bodies for supporting the said leather valves.

9. A vaporizer for explosion-engines provided with a vessel for containing liquid fuel and having an outlet at its bottom, an air-chamber having a valve-seat around the said outlet, an air-valve having a ring-shaped leather valve adapted to be seated on the said seat, and a liquid-fuel valve having a disk leather valve adapted to be seated of the said outlet, the said disk leather valve being arranged within the opening of the said ring-shaped leather valve, the said air-valve and the said liquid-fuel valve having spring-pressed metallic bodies for supporting the said leather valves, the body of the said liquid-fuel valve being held to slide in the body of the said air-valve.

10. A vaporizer for explosion-engines provided with a vessel for containing liquid fuel and having an outlet at its bottom, an air-chamber having a valve-seat around the said outlet, an air-valve having a ring-shaped leather valve adapted to be seated on the said seat, and a liquid-fuel valve having a disk leather valve adapted to be seated on the said outlet, the said disk leather valve being arranged within the opening of the said ring-shaped leather valve, the said air-valve and the said liquid-fuel valve having spring-pressed metallic bodies for supporting the said leather valves, the body of the said liquid-fuel valve being held to slide in the body of the said air-valve, and the latter having means for carrying the liquid-fuel valve along when moving into an opening position.

11. A vaporizer for explosion-engines provided with a vessel for containing liquid fuel and having an outlet at its bottom, an air-chamber having a valve-seat around the said outlet, an air-valve having a ring-shaped leather valve adapted to be seated on the said seat, and a liquid-fuel valve having a disk leather valve adapted to be seated on the said outlet, the said disk leather valve being arranged within the opening of the said ring-shaped leather valve, the said air-valve and the said liquid-fuel valve having spring-pressed metallic bodies for supporting the said leather valves, the body of the said liquid-fuel valve being held to slide in the body of the said air-valve, and the latter having means for carrying the liquid-fuel valve along when moving into an opening position, the said means being arranged to open the liquid-fuel valve after the air-valve has moved off its seat and to allow the liquid-fuel valve to close ahead of the air-valve.

811,398. **HORSESHOE.** PHILIP J. HOFFMANN, Pittsburg, Pa. Filed Jan. 23, 1905. Serial No. 242,279.

Claim.—A horseshoe having wedge-shaped lugs at its heel end, the narrowest portion of said lugs being toward the surface of the shoe, said lugs being formed with transverse recesses and the shoe-body having longitudinally-disposed grooves formed therein at opposite sides of the lugs, in combination with calk-pieces formed each with a dovetailed groove to receive the lug on the horseshoe, and with ribs adapted to enter the grooves in the horseshoe, each lug being provided with a transverse opening registering with the recess in the lug and a pin passing through said opening and fitting in said recesses to hold the calk against longitudinal movement on the lug.

811,399. **GAS-BURNER.** WILLIAM C. HOMAN and FRANK T. WILLIAMS, Meriden, Conn., assignors to Edward Miller & Company, Meriden, Conn., a Corporation of Connecticut. Filed Jan. 5, 1905. Serial No. 239,696.

Claim.—1. An incandescent gas-burner comprising a base member 1, having an exteriorly-screw-threaded portion 9, an exteriorly-screw-threaded portion 5 of smaller diameter, and a needle-tip 3 with a gas-passage having an outlet adjacent to the base of the needle-tip, a spring surrounding the base of the needle-tip, and an interiorly-threaded adjusting member 4 having a valve-outlet adapted to coact with said needle-tip, said spring being inclosed by said member and an integral burner-tube having an interiorly-threaded portion seated on the screw-threaded portion 9 of the base and an air-inlet adjacent to the gas-outlet and an opening adjacent said adjusting member, said movable adjusting member substantially filling the space in said tube above said opening.

2. In an incandescent gas-burner, the combination of a base member 1 having a screw-threaded portion 9 and a screw-threaded portion 5 of smaller diameter, a movable regulator-cap 4 adjustable on the screw-threaded portion 5, a needle-valve coacting with an outlet in said cap, a spring for causing frictional engagement between said cap and its threaded seat, and an integral burner-tube, screw-threaded onto the seat 9, and having an opening 10 for access to the regulator-cap and air-openings above the same adjacent to the gas-outlet, said burner-tube inclosing said cap and spring, said movable cap substantially filling the interior diameter of the tube above the opening 10, and preventing the passage of air except through the proper air-inlet.

811,400. **PNEUMATIC BELL-RINGER.** JOHN HOWE, St. Joseph, Mo. Filed May 6, 1904. Serial No. 206,773.

Claim.—1. In mechanisms of the class described, the combination of a bell-crank for an alarm-bell, a cylinder provided with inlet and exhaust ports in the wall at one side thereof only, a reciprocating piston mounted therein and provided with inlet and exhaust passages arranged to be connected and disconnected alternately with the inlet and exhaust ports in the cylinder, means for keeping the reciprocating piston seated on the port side of the cylinder-wall, and means for connecting the reciprocating piston with the bell-crank, substantially as described.

2. In mechanisms of the class described, the combination of a bell-crank, a cylinder provided with inlet and exhaust ports in the wall thereof at one side only, a reciprocating piston mounted therein and provided with inlet and exhaust passages opening at one side thereof only and arranged to be connected and disconnected with the inlet and exhaust ports of the cylinder during the reciprocations of the piston, a recess in said piston, a spring in said recess, a wearing-block arranged therein and interposed between the spring and the wall of the cylinder so as to force and hold said piston seated on the port side of the cylinder, and means connecting said piston with the bell-crank so as to operate the same, substantially as described.

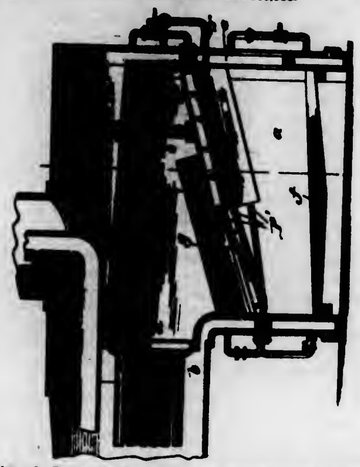
3. In mechanisms of the class described, the combination of a bell-crank, a single-acting cylinder provided with inlet and exhaust ports in the wall at one side thereof, a reciprocating piston mounted therein and provided with inlet and exhaust passages opening at one side thereof and arranged to be connected and disconnected alternately with the inlet and exhaust ports in said cylinder-wall, a radially-arranged recess in the opposite side of said piston, a helically-coiled spring in said recess, and a wearing-block interposed between said spring and the inner bore of said cylinder so as to keep the piston seated on the port side of the cylinder, and means connecting the piston with the bell-crank, substantially as described.

4. In mechanisms of the class described, the combination of a single-acting cylinder provided with inlet and exhaust ports in the wall thereof, a trunk-piston reciprocatingly mounted therein and provided with an open cup-shaped recess in its upper end, a bell and crank-pin, and a gravity connecting-rod having its lower end loosely mounted in such recess of the trunk-piston and movable vertically with relation to the piston and having an elongated slot at the other end loosely engaging the crank-pin of the bell-crank, substantially as described.

5. In mechanisms of the class described, the combination of a bell-crank and pin, a single-acting cylinder provided with inlet and exhaust ports in its wall and at one side thereof, a trunk-piston reciprocatingly mounted therein and provided with independent inlet and exhaust passages extending therethrough and adapted to be connected and disconnected alternately with the inlet and exhaust ports in said cylinder, spring mechanism for keeping said piston seated on the port side of the cylinder, an open cup-shaped recess in the upper end of said piston, an alarm-bell provided with a crank and crank-pin, and a gravity connecting rod or bar formed in two parts—a lower part provided with a rounded head on its lower end in engagement with the cup-shaped recess and an upper part provided with an elongated slot loosely engaging the crank-pin and detachably secured to the lower portion, substantially as described.

6. In mechanisms of the class described, the combination of a cylinder provided with inlet and exhaust ports in the wall thereof, a piston reciprocatingly mounted in such cylinder and provided with an open socket in its upper end, a bell-crank provided with a crank-pin, and a gravity connecting-rod having its lower end articulately mounted in such socket and movable vertically with relation to the piston and its upper end loosely connected with the crank-pin and movable vertically with relation thereto, whereby the connecting-rod is movable bodily in a vertical plane with relation to both the piston and crank-pin.

811,401. STEAM-BOILER FIRE-BOX. CHARLES W. HULLINGS, Philadelphia, Pa., assignor of one-half to James W. Thatcher, Philadelphia, Pa. Filed June 24, 1905. Serial No. 266,668.



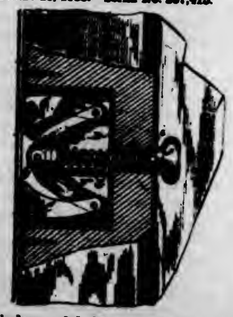
Claim.—1. In a boiler fire-box, the combination with a deflector extending backward from the front wall of the fire-box, of a forward-extending baffler-plate transversely and longitudinally parallel to said deflector, and extending from the back wall of the fire-box under the back portion of the deflector, whereby a transversely-equalized passage is formed betwen such deflector and baffler-plate, substantilly as specified.

2. In a boiler fire-box, the combination with a transversely-arched deflector extending backward from the front wall of the fire-box, of a forward-extending transversely-arched baffler-plate, extending from the back wall of the fire-box under the back portion of the deflector and parallel thereto, to form a combustion-passage, substantially as specified.

3. In a boiler fire-box, the combination with a deflector extending from the front wall of the fire-box, of a hollow baffler-plate parallel to said deflector, and upright circulating-pipes connecting and supporting the baffler-plate in position, substantially as specified.

4. In a boiler fire-box, the combination with a deflector extending from the front wall of the fire-box, of a baffler-plate extending from the rear wall of the fire-box beyond the end of said deflector and parallel thereto both in longitudinal and in transverse relation, whereby is provided, between said deflector and baffler-plate, a flame-passage of approximately equalized draft from side to side, substantially as specified.

811,402. WINDOW-SASH HOLDER. ELMER A. HYDE, Villisca, Iowa. Filed June 28, 1905. Serial No. 267,415.



Claim.—A window-sash holder comprising a casing seated in a mortise in the sash and having a tubular extension, cams pivoted to the casing and having bifurcated ends, a pull-rod having its bearing in the tubular extension of the casing, a coiled spring encircling the rod to regulate it spring-actuated, a bifurcated head upon the inner end of the rod, and curved levers engaging the bifurcations in the cams and the bifurcation in the head and pivoted thereto, substantially as and for the purpose described.

811,403. MOTOR-VEHICLE. ALEXANDER IHSEN, Indianapolis, Ind. Filed June 27, 1905. Serial No. 267,194.

Claim.—1. A motor-vehicle, having a motor-carrying frame provided with a pivotal connection with the running-gear, an upright fork pivoted to said frame and carrying a drive-wheel having a driving connection with the motor, a transverse bearing-bar having a pivotal connection at its ends with the vehicle-body, said fork having a stem engaging an aperture of said transverse bearing-bar, means in engagement with the stem of the fork for adjusting the frame, and a spring for pressing the drive-wheel to the ground, substantially as specified.

2. A motor-vehicle having a motor-carrying frame provided with a pivotal connection with the running-gear, an upright fork pivoted to said frame and carrying a drive-wheel having a driving connection with the motor, a transverse bearing-bar having a pivotal connection at its ends with the vehicle-body, said fork having a stem engaging an aperture of said transverse bearing-bar, means in engagement with the stem of the fork for adjusting the frame, a spring for pressing the drive-wheel to the ground, and means independent of said frame for steering the vehicle, substantially as specified.

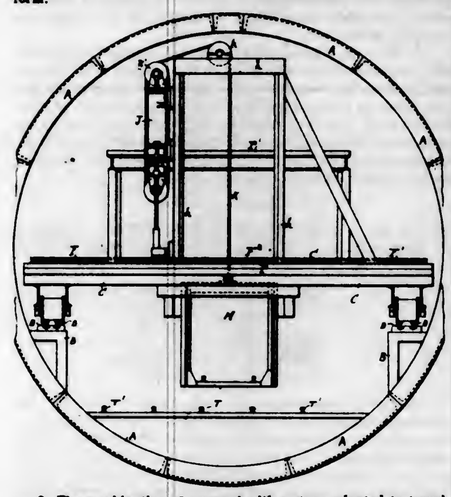
3. A motor-vehicle, having a motor-carrying frame provided with a pivotal connection with the running-gear, an upright fork pivoted to one end of said frame and carrying a drive-wheel having a driving connection with the motor, a transverse bearing-bar having a pivotal connection at its ends with the vehicle-body, said fork having a threaded stem engaging an aperture of the bearing-bar, a spring between said fork and bearing-bar upon the stem, and an adjusting-nut resting upon said bearing-bar and engaging the stem, substantially as specified.

4. A motor-vehicle having a motor-carrying frame provided with a pivotal connection with the running-gear, a drive-wheel journaled at the outer end of said frame, upright means connected to the axle of said wheel, for adjusting the same, said means having a pivotal supporting connection with the body of the vehicle, and a spring for pressing the drive-wheel to the ground, substantially as specified.

5. A motor-vehicle having a motor-carrying frame provided with a pivotal connection with the running-gear, a drive-wheel journaled at the outer end of said frame, upright means connected to the axle of said wheel for adjusting the same, said means including a transverse supporting-bar having a pivotal connection at its ends with the body of the vehicle, and a spring for pressing the drive-wheel to the ground, substantially as specified.

811,404. APPARATUS FOR ERECTING TUNNELS. HENRY JAFF, New York, N. Y., assignor to S. Pearson and Son, Inc., Long Island City, N. Y., a Corporation of New York. Filed Sept. 21, 1905. Serial No. 279,282.

Claim.—1. The combination of a tunnel with tracks for cars, a stage adapted to be traversed longitudinally above the tracks in the tunnel and a hoisting-cage carried by the stage and adapted to be lowered to the tracks and to be hoisted to the level of the stage-platform.

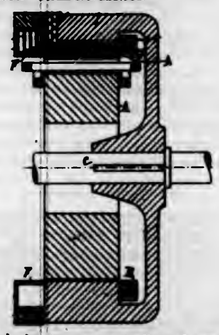


2. The combination of a tunnel with a stage adapted to travel longitudinally therein, tracks on the main platform of the stage and a hoisting-cage carried by the stage.

3. The combination of a tunnel with a stage adapted to travel longitudinally therein, said stage having a main platform and an upper platform and a cage with means to raise and lower the latter, both cage and hoisting means being carried by the stage.

4. The combination of a tunnel with a shield, a stage adapted to travel longitudinally in the tunnel, a hoisting-cage carried by the stage toward its rear, and tracks on the main platform of the stage branching from the cage to the front of the stage.

811,405. ELECTRIC MOTOR. PAUL JEGOUO, Vanves, France. Filed Oct. 18, 1904. Serial No. 228,961.



Claim.—1. A device for automatically and progressively starting monophase or polyphase motors with a rotating field, in which the current is induced in the armature by short-circuiting its coils, the combination with the armature of conducting-rings adapted when connected to short-circuit the armature, and a series of flexible bars or conductors supported adjacent to the rings and adapted when the motor is started to be pressed against one of the rings by centrifugal action to electrically connect them and thus short-circuit the armature, substantially as described.

2. A device for automatically and progressively starting monophase or polyphase motors with a rotating field, in which the current is induced in the armature by short-circuiting its coils, the combination with the armature of conducting-rings adapted when connected to short-circuit the armature, a series of flexible bars or conductors supported adjacent to the rings and adapted when the motor is started to be pressed against one of the rings by centrifugal action to electrically connect them and thus short-circuit the armature, and means for withdrawing the bars from making contact when the motor is stopped, substantially as described.

3. A device for automatically and progressively starting monophase or polyphase motors with a rotating field, in which the current is induced in the armature by short-circuiting its coils, the combination with the armature of conducting-rings adapted when connected to short-circuit the armature, a series of flexible bars or conductors supported adjacent to the rings and adapted when the motor is started to be pressed against one of the rings by centrifugal action to electrically connect them and thus short-circuit the armature, and a permanently-short-circuited armature-coil for starting the motor, substantially as described.

4. A device for automatically and progressively starting monophase or polyphase motors with a rotating field, in which the current is induced in the armature by short-circuiting its coils, the combination with the armature of conducting-rings adapted when connected to short-circuit the armature, a series of flexible bars or conductors supported adjacent to the rings and adapted when the motor is started to be pressed against one of the rings by centrifugal action to electrically connect them and thus short-circuit the armature, a permanently-short-circuited armature-coil for starting the motor, and springs of different strength arranged to act on the bars to withdraw them out of contact when the motor stops, and to effect progressive contact of the bars at starting, substantially as described.

811,406. AIR GOODS. HENRY F. KEIL, Brooklyn, N. Y. Filed May 15, 1905. Serial No. 260,555.

Claim.—1. An air mattress or cushion comprising imperforate air-proof flexible side pieces, and non-distensible stays having at each end heads formed of a plurality of parts constructed and arranged to be snapped together, the opposite inner members of each pair of heads being tied to the stays and engaging the inner surfaces of the said side pieces, and the outer imperforate members, upon the parts of the heads being snapped together, engaging the outer surfaces of the said side pieces without puncturing or cutting the same to form rigid air-proof joints, whereby outward movement of the side pieces is prevented and the impermeability of the same is preserved.

2. An air mattress or cushion comprising imperforate air-proof flexible side pieces and stays having at each end heads formed of a plurality of parts constructed and arranged to be snapped together, the opposite inner members of each pair of heads being tied to the stays and engaging the inner surfaces of the said side pieces, and the outer imperforate members, upon the parts of heads being snapped together, engaging the outer surfaces of the said side pieces without puncturing or cutting the same to form air-proof joints, whereby outward movement of the side pieces is prevented and the impermeability of the same is preserved.

3. An air mattress or cushion comprising imperforate air-proof flexible side pieces and non-distensible stays having at each end heads formed of a plurality of parts constructed and arranged to be snapped together, the opposite inner members of each pair of heads being tied to the stays and engaging the inner surfaces of the said side pieces, and the outer imperforate members, upon the parts of the heads being snapped together, engaging the outer surfaces of the said side pieces without puncturing or cutting the same to form rigid air-proof joints, the jointures being practically in a plane parallel to that of the faces of the side pieces and at right angles to the stays, whereby outward movement of the side pieces is prevented and the impermeability of the same is preserved.

4. An air mattress or cushion comprising imperforate air-proof flexible side pieces and stays having at each end heads formed of a plurality of parts constructed and arranged to be snapped together, the opposite inner members of each pair of heads being tied to the stays and engaging the inner surfaces of the said side pieces, and the outer imperforate members, upon the parts of the heads being snapped together, engaging the outer surfaces of the said side pieces without puncturing or cutting the same to form air-proof joints, the jointures being practically in a plane parallel to that of the faces of the side pieces and at right angles to the stays, whereby outward movement of the side pieces is prevented and the impermeability of the same is preserved.

811,407. FABRIC FOR AIR GOODS. HENRY F. KIEL, Dennisville, N. Y. Filed June 12, 1905. Serial No. 264,969.

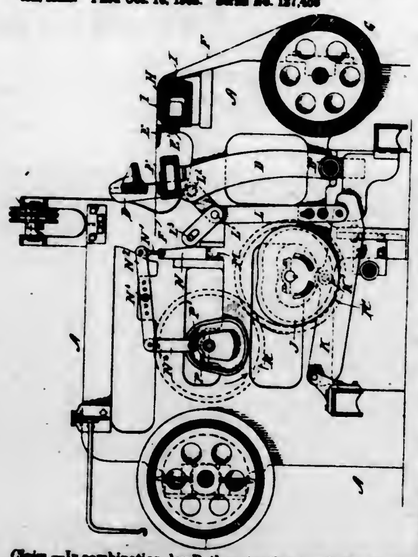
Claim.—1. In air goods a series of loops of thread dropped at intervals to form a stay-end, said loops being held together between their ends by flexible threads or filaments.

2. In a fabric for air goods a series of loops of thread dropped at intervals to form a stay-end, said loops being held together between their ends by flexible threads or filaments, in combination with a coating of air-proof material applied to the said fabric.

3. In air goods a stay-end composed of two parts at right angles to each other, each of said parts consisting of a series of loops of thread dropped at intervals to form the stay-end, said loops being held together between their ends by flexible threads or filaments.

4. In a fabric for air goods a stay-end composed of two parts at right angles to each other, each of said parts consisting of a series of loops of thread dropped at intervals to form the stay-end, said loops being held together between their ends by flexible threads or filaments, in combination with a coating of air-proof material applied to the said fabric.

811,408. LAY-MOTION FOR LOOMS. SAMUEL D. KELLEY, Boston, Mass. Filed Oct. 16, 1903. Serial No. 127,456.



Claim.—In combination, lay D, the actuating-toggle-joint mechanism connected therewith and comprising a slotted arm attached to the frame of the loom by a pin L^3, mechanism cooperating therewith for varying the movement of the lay, and comprising block N; there being a groove M, in the loom-frame in which said block slides; link N'; rocking bar N^3 pivoted to frame; link N^4, connecting the bar with the actuating-cam; and cam P, by which said parts are actuated to regulate the lay-motion and to thereby automatically vary the force of its blows upon the filling as and for the purposes specified.

811,409. PROCESS OF MAKING PAPER RECEPTACLES. JAMES C. KENNEY, Philadelphia, Pa., assignor to American Paper Bottle Company, Philadelphia, Pa., a Corporation of Pennsylvania. Filed Dec. 7, 1904. Serial No. 235,894.

Claim.—1. The process herein described of making a paper receptacle, said process consisting in forming a tapered tube of paper, of such a taper compared to the thickness of the same that a ring-section cut from the large end of the tube will fit snugly around the body at the large end thereof, cutting a ring-section from the large end of the tube, and passing the tapered tube through the ring and securing the ring to the periphery of the large end of the tube, substantially as described.

2. The process herein described of making paper receptacles, said process consisting in forming a tapered tube of paper or other suitable material, cutting the tube into sections, the alternate sections being cut to form the bodies of the receptacles, and the other sections being cut to form the reinforcing ring-sections, passing the large ends of the ring-sections over the smaller ends of said body-sections and securing the former to the opposite ends of the body-sections, substantially as described.

811,410. MEANS FOR CONVERTING MOTION. CHARLES J. KLEIN, New York, N. Y., assignor to Ralph A. Schoenberg, New York, N. Y. Filed Jan. 4, 1905. Serial No. 239,976.

Claim.—1. Improved means of the character described, comprising two members having different motion; one of such members comprising a body provided with a plurality of operative relatively angularly disposed facial portions grouped about a central axis of said body; and the other of said members being arranged to be directly operatively engaged with said facial portions in such arrangement that said facial portions are interposed directly between said latter member and said axis of said other member.

2. Improved means of the character described, comprising two members having different motion; one of said members comprising a body of varying transverse sectional areas and provided with a plurality of operative relatively angularly disposed facial portions grouped about a central axis of said body; and the other of said members being arranged to be operatively engaged with said facial portions in such arrangement that said facial portions are interposed directly between said latter member and said axis of said other member.

3. Improved means of the character described, comprising two members having different motion; one of said members comprising a body provided with a plurality of operative relatively angularly disposed smooth facial portions grouped about a central axis of said body; and the other of said members being arranged to be directly operatively engaged with said smooth facial portions in such arrangement that said facial portions are interposed directly between said latter member and said axis of said other member.

4. Improved means of the character described, comprising a rotary member, a tension member, and a reciprocating member; said tension member being connected with one of said other members, and comprising two tensionally relatively separable portions; and the other of said other members being provided with a plurality of diversely-inclined operative portions with which said tension member is engaged.

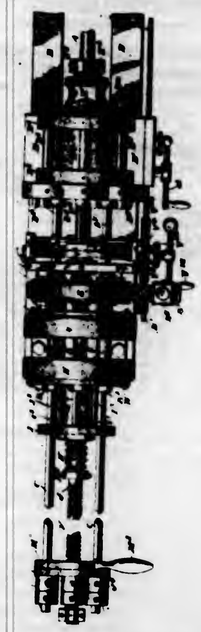
811,411. BOLT-MACHINE. JOSEPH K. KOONS, Montgomery, Pa. Filed Oct. 5, 1904. Serial No. 227,291.

Claim.—1. The combination substantially as herein described, of the framing, a carrier for the stock-rods, means for revolving the stock-rods, a feed-screw operating upon the carrier, a drive-shaft and coupling between the shaft and screw, devices for holding the stock-rods against endwise movement, means for operating the said holding devices, and devices operated by said means for releasing the coupling between the shaft and feed-screw.

2. The combination of the tool-head, cutter-heads provided with tools and with shafts journaled in the tool-head, the pinions on said shafts, the gear meshing with said pinions and means for turning said gear and for locking it in its different positions.

3. The combination with the tool-head, and the cutter-heads each having eccentrically-arranged cutters and provided with shafts journaled in the tool-head, of the pinions on the said shafts, the gear meshing with said pinions, the sleeve slidably keyed to the said gear and arranged to operate the same, and a pin carried by the sleeve and arranged to engage a relatively fixed part whereby to lock the gear in its different positions, substantially as set forth.

4. The combination in a machine substantially as described, of the cutting-off tools, a plate carrying the same and slotted in its opposite sides, standards having lugs entering said slots whereby the tool-plate may move along the standards and means for moving the tool-plate along the standards substantially as set forth.



5. The combination in a machine substantially as described, of the feed-screw, a stock-carrier arranged to be fed by said screw, the main shaft, a coupling between the main shaft and the feed-screw, clamps for holding the stock-rods from longitudinal movement, means for forcing said clamps into engagement with the stock-rods and intermediate devices between the means for operating the clamps and the coupling between the feed-screw and main shaft, substantially as set forth.

6. The combination in a machine substantially as described, of the framing, the main shaft, the rotatable guide-tubes for the stock-rods, gripping-blocks in said tubes, nuts turning on the tubes and arranged to compress the blocks upon the stock-rods, means for turning said nuts into and out of position to compress the gripping-blocks, a carrier for the stock-rods, a feeder for said carrier and intermediate devices between the nuts and the feeder for the carrier whereby the feeder may be thrown out of operation when the nuts are adjusted to position to compress the gripping-blocks, substantially as set forth.

7. The combination in a machine substantially as described of a main shaft, a feed-screw, a carrier for the stock-rods arranged for operation by the feed-screw, guide-tubes arranged to receive the stock-rods, a frame supporting said tubes, means for turning the tubes, whereby to turn the stock-rods, the tools for operating on the stock-rods arranged on the opposite side of the tube-supporting frame from the carrier, means for holding the stock-rods from longitudinal movement arranged between the said frame and the tools for operating on the stock-rods, a coupling between the feed-screw and the main shaft, said coupling being arranged between the tube-supporting frame and the stock-carrier, and rods extending from said coupling through the tube-supporting frame and arranged for operation by the devices for holding the rods from longitudinal movement, substantially as set forth.

8. The combination with the cutting-off tools, and the plate carrying the same and provided in its opposite sides with slots, of standards having lugs entering said slots, whereby the tool-plate may move along the standards, tools movably supported on said tool-plate, a cam-plate to operate in said tools, means for turning the cam-plate, and means for moving the cam-plate and tool-plate along the standards, substantially as set forth.

9. The combination in a machine substantially as described, of the tool-carrying plate, the tools movable along said plate, the cam-plate arranged to operate said tools and provided with a worm-rack, a worm-shaft meshing with said rack, bars secured to the cam-plate and having slots receiving said worm-shaft, standards carrying the cam-plate and tool-plate, and means for moving said plates along the standards, substantially as set forth.

10. The combination with the tool-plate and the cam-plate, of the tool composed of an intermediate section having a longitudinal slot, sections on opposite sides of the intermediate section, and the stud passing through said section, and having a threaded stem screwing into one of the sections, said stud passing through the tool-plate into the cam-plate, substantially as set forth.

11. The combination with the main shaft, the carrier for the stock-rods, a feed-screw for operating said carrier, a coupling between the feed-screw and the main shaft, a series of rotatable guide-tubes for the stock-rods, gearing between the said tubes and the main shaft, gripping-blocks in the guide-tubes for holding the stock-rods from endwise movement, nuts threaded on the guide-tubes and adapted to compress the gripping-blocks, the pinions on the nuts a gear-wheel meshing with said pinions and moving bodily therewith along the guide-tubes in the direction of the coupling between the main shaft and feed-screw and means arranged for operation by said gear-wheel for releasing the coupling, substantially as set forth.

12. The combination with rotatable guide-tubes for the stock-rods and having a threaded portion, of gripping-blocks in said threaded portion for holding the stock-rods against endwise movement, nuts turning on said threaded portion and provided with means for compressing the blocks upon the stock-rods, said nuts having pinions, a gear-wheel meshing with said pinions, and turning normally freely with said pinions as the latter are revolved with the guide-tubes, and means for locking said gear from turning, whereby the nuts may be held by their pinions from turning and will be caused to travel along the revolving threading portion, substantially as set forth.

13. The combination with the rotatable guide-tubes having threaded portions, the gripping-blocks in said threaded portions, nuts turning on the threaded portions and provided with means operative to compress the blocks, and said nuts being provided with pinions, a gear-wheel meshing with said pinions, means whereby the gear-wheel may be held from turning, push-rods arranged to be acted on by said gear-wheel, a feed-screw, a main shaft, a coupling between said screw and shaft, and means connecting said coupling with the push-rods, whereby the latter may be operated by the gear-wheel to release the coupling, the gear-wheel being movable toward the coupling to operate the push-rods, substantially as set forth.

14. The combination of the main shaft, the guide-tubes for the stock-rods, provided with pinions, a gear on the main shaft, and meshing with said pinions, whereby to turn the guide-tubes, said tubes being provided with threaded portions, nuts on said threaded portions and provided with pinions, means operated by the travel of said nuts along the threaded portions for clamping the stock-rods against endwise movement, and means whereby the said nuts may be held from movement whereby they will be caused to travel along the threaded portions.

15. The combination in an apparatus substantially as described, with the feed-screw, and a carrier operated thereby and arranged to feed the stock-rods, of the main shaft, means for clamping the stock-rods against endwise movement, and means operated from the stock-clamping means for uncoupling the feed-screw from the main shaft when the stock-clamps are thrown into position to grip the stock-rods, the feed-screw being driven by the main shaft, substantially as set forth.

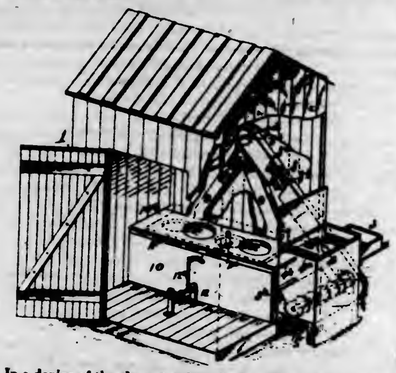
811,412. OUTSIDE DRY-EARTH CLOSET. JOHN R. KOONS, Huntingdon Mills, Pa. Filed Sept. 7, 1904. Serial No. 223,886.

Claim.—1. In a device of the character described, an excrement-chamber, a sifter, with its casing, provided above said sifter, with a platform, with one edge removed distantly from the opposite wall of said casing, a conveyer arranged below said sifter and adapted to receive the sifted material from said sifter, and an elevator adapted to actuate said conveyer and deliver into said excrement-chamber.

2. In a device of the character described, an excrement-chamber, a sifter having a pivoted bottom, with arm or bar extensions at one end, adapted to be supported upon the sifter-inclosure, means arranged below said sifter and adapted to convey the sifted material from said sifter, means adapted to elevate the conveyed material and deliver it into said excrement-chamber.

3. In a device of the character described, an excrement-chamber, a sifter and an inclosing casing therefor, said casing having se-

cured therein just above said sifter, a platform or board with one edge removed distantly from the opposite wall of said casing, and a scraper arranged upon said board or platform and having a handle extending through said casing, means for conveying away the sifted material and means for elevating said material and delivering it into said excrement-chamber.



4. In a device of the character described, a sifter and its inclosing casing, said sifter having bar or arm extensions at one end adapted to rest upon a cross-bar of said casing, and a handle for actuating said sifter, extending through said casing.

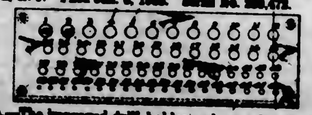
5. In a device of the character described, an excrement-chamber, a sifter, an inclosing casing therefor, a conveyer arranged within said casing and below said sifter, an elevator effective to actuate said conveyer and deliver the material conducted away by said conveyer to a point above said excrement-chamber, and a bifurcated "trunk" with its branches delivering at different points into said excrement-chamber, said "trunk" or chute being equipped with a plate-valve adapted to direct the elevated material, from the upper end of said "trunk" into either of said branches.

811,413. HOSE-SUPPORTER. ALBERT B. KURTZ, Connellsville, Pa. Filed Aug. 1, 1905. Serial No. 272,370.

Claim.—1. A support of the class described consisting of a resilient flexible strip of material, a clasp carried by each end of said material, each clasp consisting of a plate, a yoke carried by said plate to which the end of said strip is secured, rearwardly-extending hooks carried by said plate and adapted to engage hose, a central clasp carried by said strip, said clasp consisting of a plate, rearwardly-extending lugs carried by said plate, and engaging said strip, depending hooks carried by said plate and adapted to engage in a nether garment, substantially as described.

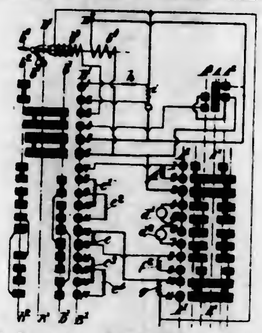
2. A support of the class described consisting of a resilient flexible strip adapted to partially encircle a limb, clasps carried by each end of said strip, a plurality of hooks carried by each clasp and adapted to engage in a hose, a clasp located centrally of said strip, a plurality of hooks carried by said clasp and adapted to engage in a nether garment the hooks on the centrally-located clasp projecting in a direction at right angles to the direction in which the hooks on the end clasps project, substantially as described.

811,414. DRILL HOLDER AND GAGE. ANTHONY LA FRANCIS, Newark, N. J. Filed Jan. 3, 1905. Serial No. 239,472.



Claim.—The improved drill holder and gage herein described, comprising a top plate having a graduated series of gaging perforations and having marks indicating the size of said perforations, an intermediate plate having a corresponding series of perforations which are larger than those of the top plate, an imperforate bottom plate, and means for holding said plates in relative position.

811,415. REGULATION OF ELECTRIC MOTORS. JOHAN G. V. LAMB, London, England, assignor of one-half to Edward Hibbard Johnson, London, England. Filed June 29, 1904. Serial No. 214,513.



Claim.—1. In regenerative motor-controlling means, the combination with the main controller-cylinder and the field-change cylinder, of means whereby the said field-change cylinder will automatically change the motor from its compound or shunt condition to its series condition, whenever the regenerated current of said motor, while in its compound or regenerative condition, falls below a predetermined value for the purpose specified.

2. In regenerative motor-controlling means, the combination with the main controller-cylinder and the field-change cylinder, of means that tend to keep the field-change cylinder in the position for bringing about the series condition of the motor, means whereby the field-change cylinder is moved against the resistance of the first-mentioned means into the position for bringing about the compound or shunt condition of the motor, and means whereby the reduction in the regenerative current below a predetermined value permits the first-mentioned means to become dominant and to automatically return the field-change cylinder to its original position for the purpose specified.

3. In regenerative motor-controlling means, the combination with the main controller-cylinder and the field-change cylinder, of a magneto-electrical device, shunt and series windings thereon, means whereby the initial movement of the handle of the main controller cylinder causes the shunt-winding to be momentarily energized and the field-change cylinder moved into the compound organizing position with relation to the motor, and means whereby the regenerative current energizes the series winding and maintains said cylinder in its shifted position so long as said current does not fall below a predetermined value, substantially as and for the purposes described.

4. In regenerative motor-controlling means, the combination with the main controller-cylinder and the field-change cylinder, of a solenoid having shunt and series windings, circuits connecting said windings to fixed contacts at the main controller-cylinder, contacts on the handle of the main controller-cylinder coöperating with the fixed contacts for enabling the shunt-winding of the solenoid to become energized, contacts on the field-change cylinder coöperating with fixed contacts for enabling the series winding of the solenoid to become energized, and a spring tending to keep the field-change cylinder in its series organizing condition with relation to the motor substantially as and for the purpose specified.

811,416. REGISTER. ALBERT LAUBER, New York, N. Y. Filed Jan. 14, 1905. Serial No. 241,151.

Claim.—1. In a register of the kind described, the combination with a series of continuously-operating shafts carrying indicator-hands, of a continuously-operated indicator-disk, a series of intermittently-operating disks loosely mounted upon the said shafts carrying the indicator-hands, gears for operating the shafts and disks, a power-shaft having a pinion for imparting motion to the gears, the said power-shaft being operated by the fluid being measured.

2. In a register of the kind described, the combination with a series of continuously-operating indicator-hands, of shafts for supporting the hands, intermeshing gears carried by the shafts, a train of gears, and a power-shaft having a pinion for operating the shafts carrying the hands, said power-shaft being actuated by the fluid being measured, a continuously-moving disk carried by one of the shafts, a series of intermittently-operated disks loosely mounted upon the remaining shafts carrying the hands, said intermittently-operated disks being actuated through the medium of the continuously-moving disk.

3. In a device of the kind described, the combination with a series of continuously-operating shafts carrying indicator-hands, a continuously-operating disk carried by one of the shafts, disks loosely mounted upon the remaining shafts and operated through the medium of the said continuously-moving disk, intermeshing gears carried by the shafts, a power-shaft operated by the fluid being measured, a pinion carried by the power-shaft, a train of gears meshing with the pinion and one of the gears of the said continuously-moving shafts, and an indicator-hand carried by the power-shaft.

4. In a register of the kind described, the combination with a series of continuously-operating shafts, each carrying an indicator-hand, of gears for operating the shafts, said gears being actuated by the fluid being measured, a continuously-operating disk, and a series of intermittently-operated disks, said continuously-operating disks engaging one of the intermittently-operating disks, and means carried by the remaining intermittently-operated disks by which they are operated, substantially as specified.

5. In a device of the kind described, the combination with a series of continuously-operated shafts carrying indicator-hands, of a disk fixed upon one of the shafts, a disk loosely mounted upon each of the other shafts and having toothed wheels connected thereto, a tooth arranged upon the continuously-moving disk and adapted for engagement with the toothed wheel carried by the disk positioned adjacent thereto, a tooth arranged upon each of the loosely-mounted disks and adapted for engagement with the toothed wheel of its respective preceding disk, gears for operating the said shafts, and a power-shaft for operating the gears, said power-shaft being actuated by the fluid being measured, all substantially as specified.

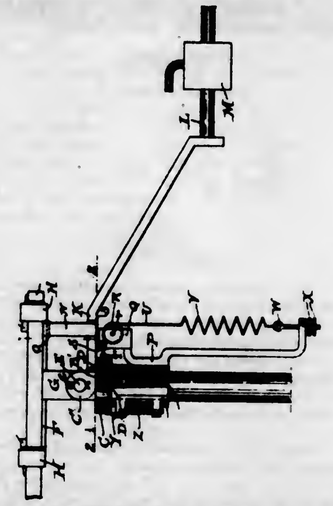
6. In a device of the kind described, the combination with a frame having a series of continuously-operating shafts journaled therein, each shaft having an indicator-hand fixed upon its forward end and adapted to travel around a dial upon the face of the frame, a disk fixed upon one of the shafts and having a series of numerals upon its face, a disk loosely mounted upon each of the remaining shafts, the said loosely-mounted disks having toothed wheels which are adapted for engagement by a tooth carried by each preceding disk, spring-pawls carried by the frame and engaging the toothed wheels, gears for operating the shafts, a power-shaft for imparting motion to the gears, said power-shaft having an indicator-hand which is designed to travel around a dial arranged upon the frame, said shaft being actuated by the fluid being measured, all substantially as specified.

7. In a register of the kind described, the combination with a frame, of a series of shafts journaled therein, each shaft having an indicator-hand which is designed to travel around a dial upon the face-plate of the frame, a disk fixed upon one of the shafts and having numerals upon its face, a disk loosely mounted upon each of the remaining shafts, said disks also having numerals upon their faces, means carried by the fixed disk for operating the adjacent disk, and means carried by the latter disk for operating its adjacent preceding disk and also means carried by this latter disk for operating its adjacent preceding disk, intermeshing gears carried by the shafts, a power-shaft carrying a pinion, and a train of gears for imparting motion from the power-shaft to the gear of the shaft upon which the fixed disk is held, and an indicator-hand carried by the power-shaft, all substantially as specified.

811,417. APPARATUS FOR JUMPING AND VAULTING. ONOREO M. LEMAY, Westpoint, N. Y. Filed June 6, 1905. Serial No. 263,963.

Claim.—1. In an apparatus for jumping or vaulting in combination, a support for the bar movable vertically and laterally in both directions, and mechanism to return said support to its normal position.

2. In an apparatus for jumping or vaulting in combination, a post, a support mounted on said post to rotate in both directions, a shaft carried by said support, and a bar-supporter connected to said shaft to have a vertical movement in both directions.



3. In an apparatus for jumping or vaulting in combination, a post, a support mounted on said post to rotate in both directions, a shaft carried by said support, a bar-supporter connected to said shaft to have a vertical movement in both directions, and mechanism to return the bar-supporter to its normal position when moved laterally or vertically therefrom in any direction.

4. An apparatus for jumping or vaulting in combination, a bar-supporter, a shaft upon which said bar-supporter is swiveled to move in both directions, and a counterweight acting on said bar-supporter.

5. In an apparatus for jumping or vaulting in combination, a bar-supporter, a support rotatable in both directions, connection between said bar-supporter and said rotatable support.

6. In an apparatus for jumping or vaulting in combination, a bar-supporter, a support rotatable in both directions, connection between said bar-supporter and said support, and means to return said support to its normal position when moved therefrom in either direction.

7. In an apparatus for jumping or vaulting in combination, a bar-supporter, a shaft, connection between said bar-supporter and said shaft whereby said bar-supporter is movably supported, a support, rotatably mounted, carrying said shaft.

8. In an apparatus for jumping or vaulting in combination, a bar-supporter, a shaft, connection between said bar-supporter and said shaft whereby said bar-supporter is movably supported, a support rotatably mounted carrying said shaft, and means to return said bar-supporter to its normal position when removed therefrom.

9. In an apparatus for jumping or vaulting in combination, a bar-supporter, a support mounted to rotate in both directions, connection between said bar-supporter and said support, a spring, a fixed connection for said spring, the free end of said spring being connected to said rotatable support.

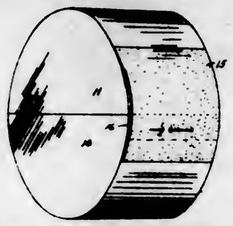
10. In an apparatus for jumping or vaulting in combination, a bar-supporter, a support mounted to rotate in both directions, connection between said bar-supporter, and said support, a spring, a fixed connection for said spring, the free end of said spring being connected to said rotatable support, an interlocking device adapted to hold said rotatable support normally in and return it to its normal position.

11. In an apparatus for jumping or vaulting in combination, a bar-supporter, a support mounted to rotate in both directions, connection between said bar-supporter and said support, a post and vertically-adjustable connection between said rotatable support and the post.

12. In an apparatus for jumping or vaulting in combination, a bar-supporter, a shaft, connection between said bar-supporter and said shaft whereby said bar-supporter is movably supported, a sup-

port, carrying said shaft, mounted to rotate in both directions, a post and vertically-adjustable connection between said rotatable support and the post.

811,418. HOLDER FOR RIBBONS, &c. HIRAM MARSH, Indianapolis, Ind. Filed May 26, 1905. Serial No. 262,146.



Claim.—1. A holder adapted to receive a roll of ribbon or other fabric, said holder being substantially the same form as the roll of ribbon or the like and provided with a body portion and lid portion hinged thereto through which the roll of ribbon or the like may be inserted into the holder and a slot below the hinge of the lid portion through which the ribbon may be withdrawn so that the ribbon may be passed over the lid portion, and means at the side of the holder opposite said slot to which the ribbon may be temporarily secured.

2. A holder for ribbon and the like that is cylindrical in form and consists of a body portion, a lid portion hinged thereto, a felt or other flexible fabric secured to the lid portion at the free side and hanging down a felt or cloth secured to the adjacent body portion to which said overhanging portion may be secured for holding the lid portion closed, and a slot in the body portion below the hinge through which the ribbon may be withdrawn.

811,419. PROCESS FOR PREPARING FIBER FROM CORNSTALKS AND ANALOGOUS PITHY PLANTS. ALBERT G. MANNS, Chicago, Ill., assignor, by direct and mesne assignments, to Food & Fiber Products Company, Chicago, Ill., a Corporation of Illinois. Filed Apr. 14, 1905. Serial No. 255,549.

Claim.—1. The process of preparing fiber from cornstalks, bagasse and analogous plants of the same genus, which consists in first practically freeing the fibrous mass from water-soluble constituents by subjecting the raw material to the action of a heated hydrous bath to effect dissolution of said constituents and then separating the solution from said mass, next subjecting the fibrous material to a digesting cook in a suitable reducing liquor drastic enough to effect moderately rapid disintegration of the intercellular tissues and incrustaceous matters but not drastic enough to effect at the same time the destruction of any large proportion of the pith-cells, continuing this digesting treatment under controlled conditions until the pith and filamentary cells are substantially set free from the connective tissues and finally separating and recovering said cells from the disintegrated mass.

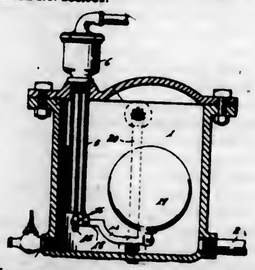
2. A process of preparing fiber from cornstalks, bagasse and analogous pithy plants which consists in subjecting the raw material to a preliminary extracting and softening process with water, separating the extracting liquor and extracts contained in solution therein from the fibrous material, then cooking the fibrous material in a usual reducing liquor until the mass is disintegrated and the fibers freed from the intercellular structure and then separating the two kinds of fiber by washing and screening.

3. The process of preparing fiber from cornstalks, bagasse and analogous plants of the same genus which consists in first practically freeing the fibrous mass from water-soluble constituents by subjecting the raw material to the action of a heated bath of water or steam to effect dissolution of said constituents and then separating the solution from said mass, next subjecting the remaining fibrous material to a digesting cook under pressure in a suitable reducing liquor drastic enough to effect moderately rapid disintegration of the intercellular tissues and incrustaceous matters but sufficiently mild to prevent effecting at the same time the destruction of any large proportion of the pith-cells, continuing this digesting treatment under controlled conditions until the pith and filamentary cells are substantially set free from the connective tissues and finally separating and recovering said cells from the disintegrated mass.

4. The process of preparing fiber from cornstalks, bagasse and analogous plants of the same genus, which consists in first practically freeing the fibrous mass from water-soluble constituents by subjecting the raw material to the action of a heated hydrous bath and effecting dissolution of said constituents and then separating the solution from said mass, next subjecting the fibrous material to a digesting cook in a suitable reducing liquor drastic enough to effect moderately rapid disintegration of the intercellular tissues and incrustaceous matters but sufficiently mild to prevent at the same time the destruction of any large proportion of the pith-cells, continuing this digesting treatment under controlled conditions until the pith and filamentary cells are substantially set free from the connective tissues, then separating the fiber from the reducing solution and finally treating the fiber in a bleaching solution.

5. The process of preparing fiber from cornstalks, bagasse and analogous plants of the same genus, which consists in first practically freeing the fibrous mass from the water-soluble constituents by subjecting the raw material to the action of a heated hydrous bath and thus effecting dissolution in said constituents, then separating the solution from said mass, next subjecting the fibrous material to a digesting cook in a suitable reducing liquor drastic enough to effect moderately rapid disintegration of the intercellular tissues and incrustaceous matters but mild enough to prevent the destruction at the same time of any large proportion of the pith-cells, continuing this digesting treatment under controlled conditions until the pith and filamentary cells are substantially set free from the connective tissues, then separating the fiber from the reducing solution and finally beating the fiber.

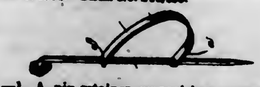
811,420. STEAM-TRAP. ELON A. MARSH, Detroit, Mich., assignor to The Greenaway Company, Detroit, Mich., a Corporation. Filed Mar. 30, 1905. Serial No. 253,991.



Claim.—1. In a steam-trap, a trap-chamber, a valve-chamber external to the trap-chamber and above the water-accumulating space therein, a main valve having a central passage, a piston-actuator for said valve, a cylinder surrounding said piston open at the top and having space for fluid therein under said piston and having discharge from said space through the said central passage in the main valve, a fluid-discharge pipe depending from the valve-chamber into the water-accumulating space of said trap, a pilot-valve for controlling the passage through the main valve and a float for actuating said pilot-valve, substantially as described.

2. In a steam-trap, a trap-chamber, a valve-chamber external to the trap-chamber and above the water-accumulating space therein, a main valve having a central passage, a piston-actuator for said valve, a cylinder surrounding said piston open at the top and having space for fluid therein under said piston and having discharge from said space through the said central passage in the main valve, a fluid-discharge pipe depending from the valve-chamber into the water-accumulating space of said trap, a pilot-valve for controlling the passage through the main valve and a float for actuating said pilot-valve, a pivot-and-slot connection between said float and pilot-valve, substantially as described.

811,421. PIN-RETAINER. WILLIAM C. MAYNARD, Miami, Fla. Filed Feb. 6, 1906. Serial No. 300,499.



Claim.—1. A pin-retainer comprising a member having an opening that receives the pin loosely, so that said member is adapted to slide upon or grip the pin when placed at different angles, and means integral with said member for applying elastic tension thereto for holding the member normally in the gripping position, substantially as described.

2. A pin-retainer comprising a member having an opening adapted to receive the pin loosely and a spring integral with said member and serving to hold the member normally at an angle to the pin so as to grip it in the manner described.

3. A pin-retainer consisting of a curved spring having at one end an opening adapted to receive a pin loosely, and its opposite end also adapted to engage the pin and press against the same, so as to exert leverage upon the first-named end and thus hold it normally inclined to the pin, substantially as described.

4. A pin-retainer consisting of a spring having a hook form, one end being provided with an opening adapted to receive a pin loosely, and the opposite end adapted to engage the pin, whereby leverage is applied to the end provided with the opening so that the pin is gripped and held by friction, substantially as described.

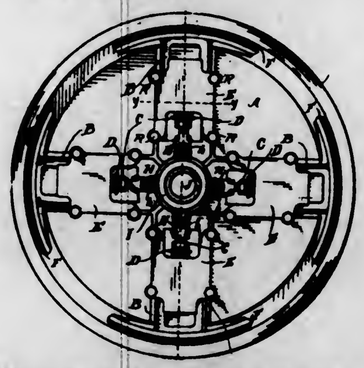
5. A pin-retainer consisting of a spring which is in curved form, one end thereof having an opening adapted to receive a pin loosely, and the opposite end provided with a notch also adapted to receive the pin, the construction being such that when the notched end of the retainer is engaged with the pin the opposite end is held at an inclination to the pin and thereby caused to grip the same in the manner described.

6. A pin-retainer consisting of a spring having a hook form, the shorter arm or member of such hook having an opening adapted to receive a pin loosely and the opposite end being adapted for engagement with the pin, the construction and arrangement being as described, whereby when the upper end of the spring is applied to the pin, the shorter arm or member is thrown downward and held at an inclination to the pin, the tension and leverage of the spring being thus proportionate to the pressure applied by or to the upper portion of the spring, substantially as described.

7. As an improved article of manufacture, a pin-retainer consisting of a spring having hook form, one end being provided with an opening adapted to receive a pin loosely, and the opposite end provided with a notch for engaging a pin, substantially as described.

8. The improved pin-retainer, consisting of a plate-spring which is in curved form, one end being provided with an opening adapted to receive a pin and the opposite end also adapted to engage the pin, the angle of the part having the opening being such that it is held at an inclination to the pin when the other end is applied thereto, substantially as described.

811,422. FRICTION-CLUTCH. ALBERT C. MEREDITH, Grand Rapids, Mich., assignor to William Harrison, Grand Rapids, Mich. Filed Jan. 16, 1906. Serial No. 296,343.



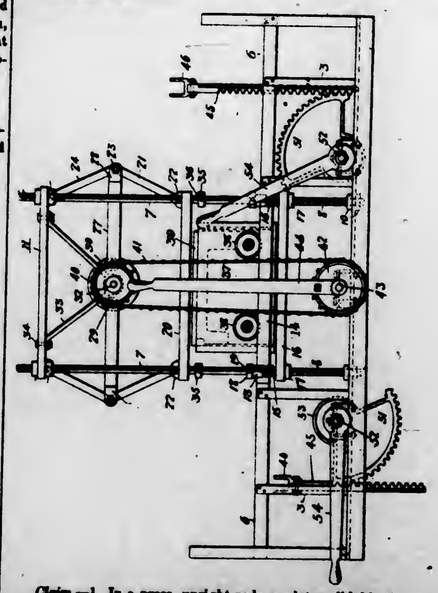
Claim.—1. In a friction-clutch, the combination with a case and a clutch-wheel, of a plurality of radially-movable clutch-arms, a corresponding series of removable caps forming guides for the arms and having outer angular extremities, springs held between the angular extremities of the caps and the inner extremities of the arms, radially-slidable sleeves movable in the inner extremities of the springs and through the inner ends of the arms and having auxiliary spring-controlling devices independent of the first-mentioned springs interposed between the caps and the arms, and also adjusting means for regulating the clutch-arms, and means engaging portions of the said sleeves for throwing the arms outwardly.

2. In a friction-clutch, the combination with a case and clutch-wheel, of a plurality of radially-movable clutch-arms, springs for retracting the said arms, levers for extending the arms into engagement with the clutch-wheel, means for retaining the arms in position, and slidable devices coöperating with the inner extremities of the arms and engaged by the levers, the inner slidable devices having springs engaging the same and independent of the springs for retracting the arms.

3. In combination with a clutch-wheel, of a plurality of slidable arms extending radially from a common center, means for throwing the said arms outwardly to cause engagement of the outer ends thereof with the clutch-wheel, a spring for each arm coöperating with the inner extremity of the latter to give a yielding pressure between the frictional surface of the arm and the clutch-wheel, a slidable element for each arm located at the inner end of the latter and coöperating with the pressure-controlling spring and having a device longitudinally adjustable therein to regulate the outward throw of the arm and contacting with the means for throwing the said arms outwardly, and a spring coöperating with the device adjustable longitudinally in the slidable element and independent of the spring for each arm for disengaging the arm from the clutch-wheel when outward pressure on said arm is removed.

4. The combination with a clutch-wheel and case, of a plurality of arms held by the case and radially movable with respect to a common center, caps secured to the case over the inner extremities of the arms to serve as guides for the latter and having outer angular extremities with inward projections, sleeves slidably mounted in the inner terminals of the arms and having adjusting means projecting therefrom and springs to give a yielding pressure thereto, retracting-springs for the arms interposed between the projections of the caps and the outer extremities of the sleeves and independent of the first-named springs, and movable elements engaging the adjusting means carried by the sleeves.

811,423. PRESS FOR MOLDING CEMENT OR PLASTIC BLOCKS. CHARLES A. MEYERS, Leipsic, Ohio. Filed Aug. 11, 1905. Serial No. 273,816.



Claim.—1. In a press, upright rods, a platen slidable thereon, toggle-levers composed of links arranged in pairs at opposite ends of the platen and pivotally suspended from a support at the upper part of said rods and links pivotally connected to the platen and having their upper ends lying between the pairs of suspended links and jointed thereto, and pitmen connected to said links at their junction with each other for operating the same, substantially as described.

2. In a press, upright rods, a platen slidable thereon, toggle-levers pivotally connected at one end to the platen and at the other end to a support at the upper end of said rods, pitmen formed with a fork

as one end and spanning the meeting ends of the toggle-levers and pivotally connected thereto, and eccentrics intermediate of and to which the inner ends of said pitmen are connected for actuating the toggle-levers, substantially as described.

2. In a press, a mold-supporting track, rods rising above the track, a platen sliding on the rods above the track, toggle-levers located at opposite sides of the platen and connected with the platen and with a support, pitmen connected with the toggle-levers, and eccentrics intermediate of and with which the inner ends of the pitmen are connected for operating the pitmen, substantially as described.

4. In a press, upright rods, a platen, levers for operating the platen, a mold-supporting track beneath the platen, sleeves slidable on the rods and having the track connected thereto, springs beneath said sleeves and means supporting said springs, substantially as described.

5. In a press, a platen, and a yieldingly-supported mold-sustaining track beneath the platen, substantially as described.

6. In a press, upright rods, sleeves mounted on said rods, a mold-sustaining track supported from said sleeves, springs forming a cushion for said sleeves, and means limiting the movement of the sleeves, substantially as described.

7. In a press, upright rods, a toggle-lever-actuated platen slidable on the rods, a mold-supporting track below said platen, sleeves slidable on the rods and having said track connected thereto, springs forming a cushion for said sleeve, and a fixed platen below said track, substantially as described.

8. In a press, the base-frame supporting end tracks, upright rods, sleeves slidably mounted on said rods, a mold-supporting track connected to said sleeves and located between the end tracks, springs sustaining said sleeves and intermediate track, a platen slidably mounted on the rods above said track, and levers for moving said platen, substantially as described.

9. In a press, a support for a mold, a lifting-bar for lifting the molded block out of the mold, and a tilting device connected to said bar for turning over the block as it leaves the mold, substantially as described.

10. In a press, a support for a mold, a lifting-bar for lifting the molded block out of the mold, and a finger pivoted to the bar and adapted to engage with a part of the mold in turning over the block as it leaves the mold, substantially as described.

11. In a press, a support for a mold, a lifting-bar for raising the molded block, a finger pivoted to the bar and adapted to engage a part of the mold and provided with a shoulder to aid in turning over the block as it leaves the mold, substantially as described.

12. In a press, a support for the mold, a bottom board to the mold, an L-shaped plate or shelf within the mold, said plate and board having corresponding openings, a lifting-bar for raising the molded block, a finger provided with a shoulder and pivoted to the bar and arranged to enter the openings in said plate and bottom board in turning over the block as it leaves the mold, substantially as described.

13. In a press, a support for a mold, an L-shaped plate fitting in the mold and formed with an opening, a lifting-bar for raising the molded block, a finger pivoted to the bar and entering the opening in the plate and formed with a shoulder bearing against the plate, said finger turning with the plate and block as the block is turned over in leaving the mold, substantially as described.

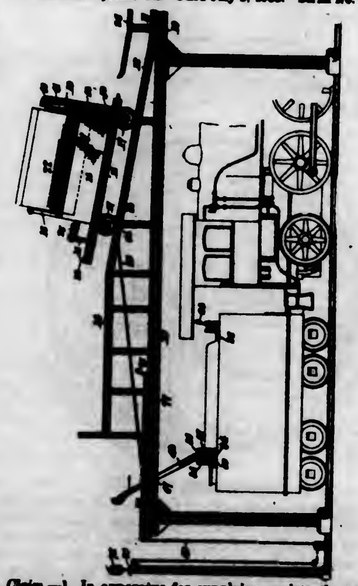
14. In a press, a support for a mold, a rack-bar for raising the molded block, a finger pivoted to the bar and engaging a part of the molded block and adapted to tilt as the block is turned over in leaving the mold, and a toothed segment engaging the rack-bar to raise and lower the same, substantially as described.

15. A press comprising upright rods, a fixed platen adapted to be held at various positions on the rods, an upper platen slidably mounted on the rods, a plate or frame connecting together and bracing the rods at their upper ends, links pivotally suspended from said plate or frame between the rods, links pivotally connected to the platen and jointed to said suspended links, pitmen pivotally connected with said links where they are joined together, and a rotatable shaft provided with eccentrics to which the inner ends of said pitmen are connected on opposite sides of said shaft, substantially as described.

811,424. SUBSOILING-PLOW. JOHN F. HINCLAMEE, Vodaway, S. D. Filed July 12, 1905. Serial No. 269,494.

Claim.—A subsoiling-plow comprising a beam, a yoke vertically adjustable at the front end of the beam, a roller mounted in said yoke, and an arm pivotally connected to the yoke and also pivotally connected to the beam, an upwardly and rearwardly inclined trough suspended from the beam and having a lateral extension at the rear end, a cutting-blade on the front end of the trough, a yoke depending from the beam, and a shoe attached to said depending yoke.

811,425. COALING DEVICE FOR MOVING TRAINS. CHARLES M. MILLER, Tyrone, Pa. Filed July 3, 1905. Serial No. 268,661.



Claim.—1. In apparatus for supplying coal to the tenders of moving railway-trains, an elevated support arranged above the railway-track, and provided with inclined rails, a dumping-car mounted on the rails, means for locking the dumping-car from movement, and a train-carried member for releasing the car in advance of the arrival of the tender thereunder, permitting the car to descend the inclined rails by gravity, said member serving subsequently to engage and move the car, and serving further to trip the dumping mechanism and permit the dumping of the load carried by the car.

2. In apparatus of the class described, an elevated structure having an inclined track, a dumping-car arranged on said inclined track, a chock for holding the same from movement, a lever connected to said chock, and a train-carried member adapted to engage said lever in advance of the arrival of the tender under the car, permitting the car to descend the inclined track and acquire momentum in advance of the dumping operation.

3. In apparatus of the class described, an elevated support, a dumping-car arranged to travel thereon, a sectional bucket having locking-fingers arranged in close relation, a release-bar having lugs engaging said fingers, and an arm carried by the train and arranged to move said bar to release position.

4. In apparatus of the class described, the combination with an elevated support, of a car arranged to travel on the support, a sectional dumping-bucket carried by the car, locking-fingers carried by the bucket members, a release-bar having lugs for engaging said fingers, and a train-carried arm for moving the bar to release position and for moving the car at a speed equal to that of the train.

5. In apparatus of the class described, the combination with an elevated support, of a car arranged to travel on the support, a sectional dumping-bucket on the car, a trip mechanism for releasing the bucket, a slidable frame for operating said trip mechanism, a pair of fingers carried by the frame and having cam-shaped inner ends, and a train-carried arm arranged to engage and be guided by said fingers.

6. In apparatus of the class described, the combination with an elevated support, of a car arranged to travel thereon, a sectional bucket on the car, locking-fingers carried by the bucket members, a release-bar engaging said fingers, a slidable frame connected to the release-bar, a train-carried arm for engaging such frame and forcing the release-bar to disengaged position, and a pair of guiding-fingers pivoted to the frame and having cam-shaped free ends for guiding said arm to proper position.

7. In apparatus of the class described, the combination with an elevated frame, of a car arranged to travel on the frame, a sectional dumping-bucket on the car, a pivotally-mounted counterweighted chute on the car at a point below the bucket, and movable to open position under the weight of the contents of said bucket, and a train-carried means for releasing the bucket.

8. In apparatus of the class described, the combination with an elevated support, of a car, a sectional bucket carried by the car, a chute pivoted to the lower portion of the car at a point under the bucket, a counterweight for holding the chute in elevated position when empty, and a train-carried means for releasing the bucket and insuring movement of the car at a speed equal to that of the train.

9. In apparatus of the class described, the combination with an elevated support, of a dumping-car arranged to travel thereon, a pivotally-mounted arm carried by the train, a locking-pin for holding the arm in elevated position, and an operating-lever for releasing said pin and allowing the arm to drop to inoperative position.

10. In apparatus of the class described, the combination with an elevated structure, of a dumping-car mounted thereon, means for locking said car from movement, and a signal connected to said locking means.

11. In apparatus of the class described, the combination with an elevated support, of a dumping-car mounted thereon, a signal, and means for automatically moving said signal in accordance with the position of the car.

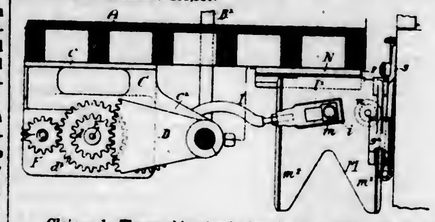
811,426. ADJUSTABLE CRANK-DISK. ISA G. MITCHELL, Hooker, Colo., assignor of one-twelfth to Arthur C. Hamilton, one-twelfth to Frank B. Sheridan, one-twelfth to Reuben S. Ball, one-twelfth to Lee Peterson, one-twelfth to Frank H. Jo Hastings, and one-twelfth to George H. Aicher, Hooker, Colo. Filed May 15, 1905. Serial No. 260,657.

Claim.—1. A cylindrical body having a recessed portion in combination with an eccentric-disk mounted in said recessed portion, said eccentric-disk being provided with an annular flange adapted to engage the recess of said annular body.

2. A circular body having a recessed portion provided with an offset, in combination with an eccentric-disk rotatably mounted in said recessed portion, said eccentric-disk being provided with an annular flange adapted to engage the offset in said annular body.

3. A cylindrical body having a recessed portion, in combination with an eccentric-disk rotatably mounted in said recessed portion, said eccentric-disk being provided with a peripheral groove and an annular rib, said rib being adapted to engage the recess of said cylindrical body, and means carried by said cylindrical body adapted to enter said groove.

811,427. LOCKING MECHANISM FOR ELEVATORS. JOHN S. MUCKLE, Philadelphia, Pa., assignor to Standard Elevator Interlock Company, Philadelphia, Pa., a Corporation of Pennsylvania. Filed Oct. 28, 1904. Serial No. 230,267.



Claim.—1. The combination in door-locking mechanism for elevators, of a plunger mounted under the floor of a car, a shaft under the car and controlling the operating mechanism of the car, gearing mounted under the car and connecting the shaft with the plunger, and a door-lock and a plunger-lock on the elevator-well, substantially as described.

2. The combination in a door-locking mechanism for elevators, of a plunger mounted under the floor of the car, a frame also mounted under the floor of the car, a shaft controlling the operating mechanism of the car, elliptical gears carried by the frame connected to the plunger and geared to the operating-shaft, and door-locking mechanism on the elevator-well arranged to be acted upon by the plunger, substantially as described.

3. The combination of an elevator-car, a plunger, an operating-shaft for the controlling mechanism and a frame, all mounted under the floor of the car, gears carried by the frame, a rod connecting the said gearing to the plunger, a segment on the operating-shaft meshing with the said gearing, and door-locking mechanism on the elevator well arranged to be actuated by the plunger, substantially as described.

4. The combination of an elevator-car, a frame secured to the car under the floor thereof, elliptical gears on one side of the frame and plain gears on the opposite side of the frame, a shaft mounted on the frame, a plain gear and an elliptical gear carried thereby, an operating-shaft mounted in bearings under the floor of the car, means for operating the said shaft to start and stop the car, a segment on said shaft meshing with the plain gears, a plunger, a slide therefor, a rod connecting the plunger with one of the elliptical gears, and a door-locking device actuated by the plunger, substantially as described.

5. The combination of an elevator-car, a frame secured to the under side of the car, an operating-shaft for controlling the starting and stopping of the car, a bearing for said shaft carried by the frame, a segment on the shaft, a pinion carried by a stud on the frame, a gear-wheel mounted on the hub of the pinion, a shaft having its bearings in the said frame, a pinion carried by the shaft and meshing with the gear-wheel, an elliptical gear-wheel mounted on the opposite end of the shaft, a second stud on the frame, a second elliptical gear-wheel on said last-mentioned stud and meshing with the first elliptical gear-wheel, a pin on the second elliptical gear-wheel, a plunger, a rod connecting the plunger with the pin on the second elliptical gear-wheel, and a door-locking device actuated by the plunger, substantially as described.

6. The combination in means for releasing a landing-door when the elevator-car is at the landing and locking the operating mechanism when the door is opened, of an elevator-car, a frame secured to the under side of the car, gearing carried by said frame, an operating-shaft also under the bottom of the car, a segmental arm on the shaft meshing with the gearing on the frame, a plunger mounted on the under side of the car and connected to the gearing, an operating-lever connected to the operating-shaft, an elevator-landing door, a lock therefor arranged to be actuated by the plunger, and a lock on the wall of the elevator-well arranged to engage the plunger when

the said plunger is projected and the door is opened, whereby the operating mechanism of the car is locked, substantially as described.

811,428. CONFORMER-CORSET. CHARLES MUNTER, New York, N. Y. Filed Apr. 5, 1905. Serial No. 254,626.

Claim.—A conformer-corset, comprising a back formed of two sections, having their upper edges shaped to conform to the contour of the neck at the back and partly at the sides, the sections being formed with armholes, the front portions thereof forming integral and unbroken shoulder-straps adapted to the true formation of the shoulder-blades, adjacent portions of the breast, and the armpits of the wearer, the front edges of the straps being curved downwardly and outwardly, the curves being on convex lines, and their outer or rear edges being curved at top and bottom on concave lines and curved on convexed lines intermediate of the said curved portions forming projections which fold outwardly and prevent chafing under the armpits, a series of lacings connecting the sections of the back, each series being carried downward at the outer face of the said sections in opposite directions, and a sectional belt, to the rear ends of the sections of which the lacings are secured, substantially as herein shown and described.

811,429. CRUDE-OIL BURNER. STEPHEN B. MCKNIGHT, Iola, Kans., assignor to Samuel Davidson, Yates Center, Kans. Filed May 26, 1905. Serial No. 262,189.

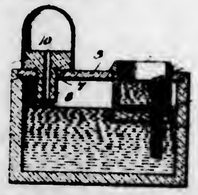
Claim.—1. In a hydrocarbon-oil burner, a frame, an oil-supply tube supported on the frame, a return-pipe surrounding said tube and communicating with a mixing-chamber having an outlet into the frame, an air-supply pipe bent in substantially rectangular form having portions extended along the inner sides and ends of the frame, and an ejector on one end of said air-pipe leading into the mixing-chamber.

2. A hydrocarbon-oil burner comprising a frame, a grating arranged on the top thereof, an oil-supply tube supported in the grating, a return-pipe for oil surrounding the said tube and communicating with the mixing-chamber, having an outlet into the frame, an air-supply pipe having portions extended along the inner sides of the frame and along the ends thereof, and an adjustable ejector on one end of said air-pipe and leading into the mixing-chamber.

3. In a hydrocarbon-oil burner, a frame, two grates removably placed on the top thereof, cross-bars on said grates having depressions at the center, an oil-return pipe having its ends seated in said depressions, a casting with which the said return-pipe connects, an oil-tube extended from said casting through said return-pipe and terminating inward of its inner end, a port leading from said return-pipe through the casting into a mixing-chamber having a reduced outlet in the frame, an air-pipe having a portion arranged in the frame, and an ejector leading from one end of said air-pipe into the mixing-chamber.

4. In a hydrocarbon-burner, a pan having openings in its bottom, tubes surrounding said openings and extending upward in the pan, a frame detachably mounted on the pan, inverted-V-shaped deflectors attached to the frame and extending over said tubes, and a burner proper comprising a vaporizing-pipe supported on the frame, and an air-heating pipe arranged in the frame the said pipe being arranged in substantially rectangular form to pass along the sides and ends of the frame.

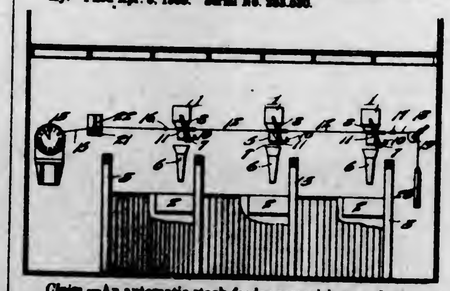
811,430. INKSTAND. ERNEST J. OSBORN, Oakland, Cal. Filed June 3, 1905. Serial No. 263,696.



Claim.—1. In a device of the character set forth, a reservoir, a well having connection therewith, a compressor mounted on the reservoir, a feed-tube adjustably carried by the well and having its lower end projecting into the reservoir, and a protector situated within the well and adapted to support the tube in adjusted position.

2. In a device of the character set forth, a reservoir, a well having connection therewith, a compressor mounted on the reservoir, a feed-tube adjustably carried by the well and having its lower end projecting into the reservoir, said tube being provided with a passage restricted at its lower end and gradually increasing upwardly, and a protector situated within the well and adapted to retain the said tube in its adjusted position.

811,431. TIMB STOCK-FEEDER. WILLIAM H. PAINE, Louisville, Ky. Filed Apr. 3, 1905. Serial No. 253,630.



Claim.—An automatic stock-feeder comprising an alarm mechanism, a feed-box having a movable bottom, means to move said bottom from closing position with relation to the feed-box, a flexible connection between the alarm mechanism and the movable bottom, a controlling-roller about which said connection is wound, and a stop for limiting the movement of said roller.

811,432. MEANS FOR DISPLAYING PICTURES AND THE LIKE. ALBERT B. PRAGER, Everett, Wash. Filed Mar. 13, 1905. Serial No. 249,968.

Claim.—1. An incasement comprising a plurality of sections arranged one on the other and having their edges provided with spaced-apart ribs, and a cementitious binder extending over the adjacent ribs of said sections and into the spaces between the ribs of the respective sections.

2. An incasement comprising a plurality of transparent sections arranged one on the other, said sections being formed with spaced-apart ribs on their edges, the ribs of each section having their inner faces cut out, and a cementitious binder extending over the adjacent ribs of said sections and into the cut-out portions of the ribs of the respective sections.

3. An incasement comprising a plurality of transparent sections arranged one on the other, said sections having their edges provided with raised portions, and a cementitious binder extending over said raised portions for holding the sections together.

4. An incasement comprising a plurality of transparent sections arranged one on the other, said sections having ribs formed on their edge portions, the adjacent ribs of said sections being of less height than the other ribs, and a cementitious binder extending over the adjacent ribs of said sections and into the spaces between the ribs of the respective sections.

811,433. CALCINATION OF HYDRATED ALUMINA. ALFRED R. PECHINEY, Salindres, France, assignor to Compagnie des Produits Chimiques d'Alais et de la Camargue, Lyon, France. Filed Apr. 3, 1905. Serial No. 253,569.

Claim.—1. The improved process of calcinating hydrated alumina, according to which such hydrated alumina is calcined in the presence of a fluorid at a temperature of 1,200° centigrade, or thereabout, substantially as set forth for the purpose specified.

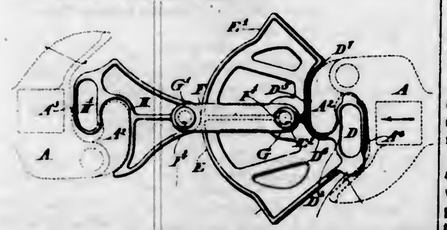
2. The improved process of calcining hydrated alumina, according to which such hydrated alumina is calcined in the presence of a fluorid volatile at the temperature to which the calcination is effected, substantially as set forth for the purpose specified.

3. The improved process of calcining hydrated alumina, according to which such hydrated alumina is calcined in the presence of fluorid of aluminium, substantially as set forth for the purpose specified.

4. The improved process of calcining hydrated alumina, according to which such hydrated alumina is calcined in the presence of a fluorid, the mixture containing approximately one part of fluorin to one hundred parts of anhydrous alumina, substantially as set forth for the purpose specified.

5. In the calcination of hydrated alumina, mixing a solution of fluorid of aluminium with the hydrate of alumina to be calcined, so that the mixture contains say one part of fluorin to one hundred parts of anhydrous alumina.

811,434. AUXILIARY CAR-COUPLING. GEORGE M. PENNEPACKER and CHARLES S. LAGOW, Philadelphia, Pa.; Clara W. Pennepacker administratrix of said George M. Pennepacker, deceased. Filed Mar. 28, 1905. Serial No. 252,449.



Claim.—1. An auxiliary coupling for cars having in combination a supporting-head adapted to engage with and rest on an automatic vertical-plane coupling-head, said supporting-head having a laterally-extending buffer-surface, in combination with a coupling-head adapted to couple automatically with the standard vertical-plane coupler, and means for securing the coupling-head to the supporting-head with freedom for both lateral and angular adjustment, said coupling-head being arranged in all positions to contact with the buffer-surface on the supporting-head.

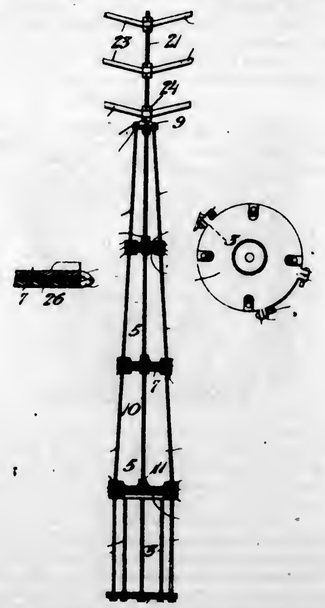
2. An auxiliary coupling for cars having in combination a supporting-head adapted to engage with and rest upon an automatic vertical-plane coupling-head, in combination with a coupling-head adapted to couple automatically with the standard vertical-plane coupler, links pivotally connected to the supporting-head and to the coupler-head and a buffer secured or formed on the supporting-head and against which the buffing strains on the coupler-head are directly taken up in all positions of said head.

3. An auxiliary coupler having a supporting-head adapted to engage with a vertical-plane coupler, and formed with a tapered enlargement or enlargements on its jaw or intereagaged portion D, to secure a wedging engagement with a closed coupler.

4. An auxiliary coupler having a supporting-head adapted to engage with a vertical-plane coupler and formed with tapered enlargements D', D^2, on its jaw or intereagaged portion D, to secure a wedging engagement with a closed coupler.

5. An auxiliary coupler having a supporting-head adapted to engage with a vertical-plane coupler and formed or provided with a buffing and guide plate E, extending from it in a substantially horizontal plane, in combination with links F, F, pivoted to the supporting-head above and below plate E, and a coupling-head adapted to automatically engage with a standard coupler pivoted on the free ends of the links in front of plate E.

811,435. TELEGRAPH OR TELEPHONE POLE. JAMES M. PERDUE, Matthews, Ga. Filed July 11, 1905. Serial No. 269,344.



Claim.—1. A post comprising a series of sections, each formed of rods and heads, means for pivotally connecting the heads of the superposed sections, and means for uniting the heads against movement on their pivotal connections.

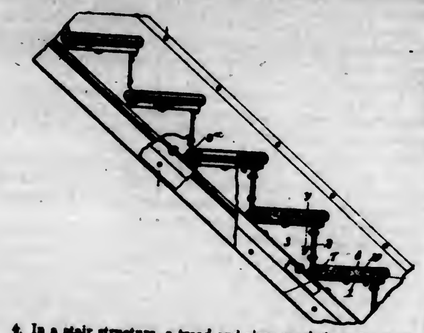
2. A post comprising a base-section, a crown-section, and a series of intermediate sections, each section comprising rods connected with heads, means for pivotally connecting the heads of the superposed sections, means for uniting the heads against movement on their pivotal connections, a supporting-stem carried by the head of the crown-section, and arms supported by said stem.

811,436. STAIR STRUCTURE. MAX PLOTKIN, New York, N. Y., assignor to Clara Bein, Brooklyn, N. Y. Filed Mar. 16, 1905. Serial No. 250,431.

Claim.—1. In a stair structure, a nosing forming a pocket and having a downwardly-extended flange at its upper edge.

2. In a stair structure, a nosing forming a pocket and having a downwardly extended and inclined flange at its upper edge.

3. In a stair structure, a tread and a riser having a reëntrant at its lower portion above the tread.



4. In a stair structure, a tread and riser consisting of a single sheet of metal, the riser having a reëntrant at its lower portion, and a nosing formed on its upper portion.

5. In a stair structure, a tread and riser, consisting of a single sheet of metal, the riser having a reëntrant at its lower portion, a nosing forming a pocket, and a downwardly-inclined flange at the upper edge of said nosing.

6. In a metal stair structure, a string-piece bent to form a ledge at its lower portion, treads and risers, angle-plates secured to the treads and risers and to said ledge, and means for securing concrete or the like on the treads.

811,437. RIFLE-CARRYING ATTACHMENT. WILLIAM H. READ, Lipton, Canada, assignor to Roland J. Hemmiet, Lipton, Canada. Filed June 2, 1905. Serial No. 263,445.

Claim.—1. A firearm-carrying attachment comprising a belt, a shoulder-strap attached at one end to the belt and its free end adapted to be suspended over the wearer's shoulder, said strap provided with a holder adapted to be attached to the firearm, and a muzzle-holding strap separate from the shoulder-strap, and carried by the belt.

2. A firearm-carrying attachment comprising a belt, a shoulder-strap attached thereto at one end only, and adapted to depend from one shoulder of the wearer, said shoulder-strap being extensible and provided with a holder adapted to be attached to the firearm to be carried, and a muzzle-holding strap connected with the belt and separate from and independent of the shoulder-strap.

3. A firearm-carrying attachment comprising a belt, a shoulder-strap permanently secured thereto at one end only, and comprising two parts adjustably secured together, one having means at its free end for attachment to the firearm to be carried, and a muzzle-holding strap attached to the belt and separate from the shoulder-strap.

4. A firearm-carrying attachment comprising a belt, a shoulder-strap, secured thereto, with one end adapted to hang over the wearer's shoulder and having means thereon for attachment to the firearm and a muzzle-holding strap permanently secured at one end to the belt and detachably connected with the belt at its other end.

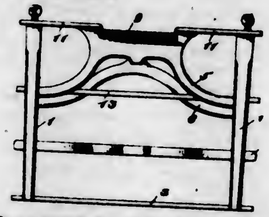
5. A firearm-carrying attachment comprising a belt, a shoulder-strap attached at one end to the belt and the other end free and adapted to hang over the shoulder of the wearer, its free end having a holder constructed and adapted to encircle a portion of the firearm, whereby the latter is adapted to turn therein.

6. A firearm-carrying attachment comprising a belt, and a shoulder-strap connected therewith with one end free and adapted to be suspended over the shoulder of the wearer, said free end terminating in a holder, said holder being a widened-out portion of the shoulder-strap with its edges brought together, and adapted to be looped around a portion of the firearm to be carried.

811,438. RUNNING-SHOE. BYRON F. ROGERS, Philadelphia, Pa., assignor of one-half to Benson Johnson, Philadelphia, Pa. Filed Aug. 21, 1905. Serial No. 274,209.

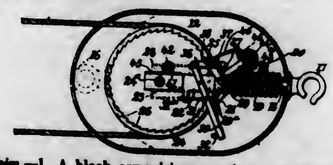
Claim.—The herein-described runner's shoe consisting of a flexible upper and sole made of a single piece, and shaped to the foot when in running position, with the heel portion raised above the vamp or ball portion, and a stiff tap-sole secured to the ball portion of the shoe, said tap-sole being leveled or skived off at the front and rear, and provided with spikes or spurs, essentially as described.

811,439. SAW-TOOL. COLLINS RITTS, Shingleton, Col. Filed Apr. 3, 1905. Serial No. 253,332.



Claim.—In a saw-tool, the combination of a frame, line-plate 11, an intermediate drag-plate 9, standards 1 for supporting said plates, a guide-bar 13 connecting said standards, a bearing-spring 12 on the frame, a file-holder comprising a series of lugs 14, 15 extending laterally on the inside of the frame and set-screws 8 extending vertically through the top of the frame to hold a file in place upon the lugs, substantially as described.

811,440. BLOCK. WILLIAM F. ROGERS, Rockville, Tenn. Filed May 5, 1905. Serial No. 259,696.



Claim.—1. A block comprising a casing, a rotatable sheave bodily movable in the casing, and means for locking the sheave against rotation after a definite bodily movement.

2. A block comprising a casing, a rotatable sheave bodily movable in the casing, means for resisting this movement of the sheave, and means for locking the sheave against rotation after a certain amount of resistance has been overcome.

3. A block comprising a casing, a rotatable sheave bodily movable in the casing, and means operable by the bodily movement for locking the sheave against rotation.

4. A block comprising a casing, a rotatable sheave bodily movable in the casing, means for locking the sheave against rotation after a definite bodily movement, and means for varying the range of effective movement.

5. A block comprising a casing, a frame movable therein, a sheave journaled in the frame and having locking projections, and locking mechanism mounted upon the frame and cooperating with the projections and with an element carried by the casing.

6. A block comprising a casing, a frame movable therein, a sheave journaled in the frame and having locking projections, locking mechanism mounted upon the frame and cooperating with the projections, and a contact member movable upon the casing and which may be engaged by the locking mechanism.

7. A block comprising a casing, a rotatable sheave bodily movable in the casing, means for locking the sheave against rotation after a definite bodily movement, and an audible signal operable by the locking mechanism.

8. A block comprising a casing, a rotatable sheave bodily movable in the casing, means for resisting this movement of the sheave, means for locking the sheave against rotation after a certain amount of resistance has been overcome, and an audible signal sounded when the sheave is locked.

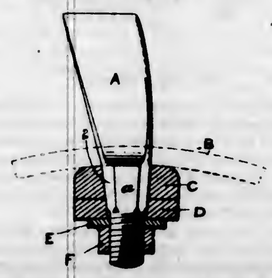
9. A block comprising a casing, a rotatable sheave bodily movable in the casing, means for locking the sheave against rotation after a definite bodily movement, and an indicator operable by the bodily movement of the sheave.

10. A block comprising a casing, a rotatable sheave bodily movable in the casing, means for resisting this movement of the sheave, means for locking the sheave against rotation after a certain amount of resistance has been overcome, and means for indicating the resistance overcome.

11. A block comprising a casing, a frame movable therein, a sheave rotatable in the frame and having teeth, a latch which may engage the teeth, a dog for the latch, a lever fulcrumed upon the frame and cooperating with the dog, and a contact member carried by the casing and situated in the path of the lever.

12. A block comprising a casing, a frame movable therein, a sheave rotatable in the frame and having teeth, a latch which may engage the teeth, a dog for the latch, a lever fulcrumed upon the frame and cooperating with the dog, a setting-link connecting the lever and latch, and a contact member carried by the casing and situated in the path of the lever.

811,441. SEPARATOR-TOOTH. HENRY R. ROSEMOND, Richmond, Ind. Filed Mar. 13, 1903. Serial No. 147,617.



Claim.—A separator-tooth having a tapering shank hexagonal in cross-section, one of the longer diameters of the hexagon being directly from front to rear of the tooth, as hereinbefore set forth.

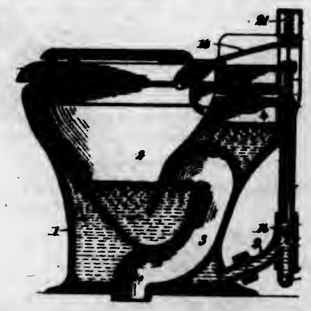
811,442. DENTAL AND SURGICAL LAMP. CLARENCE F. ROGERS, Conneaut, Ohio. Filed Feb. 24, 1905. Serial No. 247,128.

Claim.—A device of the character described comprising a lens-holder embodying two telescopic tubes in one of which is a lens and the other of which is provided with an outwardly-beveled flange at its end, a conical reflector open at both ends with its smaller end engaging around said flange, and a lamp-holder or sleeve projecting laterally from said reflector.

811,443. COLLAR-BUTTON. CLARENCE F. ROGERS, Conneaut, Ohio. Filed May 3, 1905. Serial No. 258,693.

Claim.—As a new article of manufacture a collar-button provided with a head, a spring-plate forming a closure for the rear face of said head and the latter being provided on its outer face with a slot and a spur pivoted to said head within the slot and provided on its butt-end with two faces set at an obtuse angle with relation to each other and designed to bear against the spring-closure for the rear face of the head, whereby said closure may hold said spur either flush with the plane of said slot or protruded therefrom according against which face of said spur the closure bears.

811,444. WATER-CLOSET. FRANK SCHUH, Albany, N. Y. Filed Apr. 10, 1905. Serial No. 254,809.



Claim.—1. A water-closet comprising an outer casing, a hopper arranged therein and spaced therefrom to form a water-receiving chamber, a water-supply pipe having communication with the lower portion of the chamber and having a valve-seat, a pipe leading from said supply-pipe to the upper portion of the hopper and having a valve-seat, said two valve-seats being adjustable toward and from each other, a valve for controlling the inlet of water and also for controlling the passing of water through the pipe leading to the upper portion of the hopper, and a spring for causing a movement of said valve in one direction.

2. A water-closet comprising an outer casing, a hopper arranged therein, a water-receiving chamber between the hopper and casing, a swinging seat, a lever extended rearward from the said seat, an inlet-pipe communicating with the lower end of said chamber, a pipe leading upward from the inlet-pipe and communicating with the upper portion of the hopper, a valve for controlling the inlet of water from the first-named pipe and also for controlling the passing of water through the last-named pipe, adjustable seats for the valve, a stem extended upward from the same through said last-named pipe, and also through the lever attached to the seat, and a spring for moving the valve downward.

3. A water-closet comprising an outer casing, a hopper arranged therein and a siphon leading from the hopper the said hopper and siphon being spaced from the outer casing to form a water-receiving chamber, a water-inlet pipe having a valve-seat, a branch leading from said inlet-pipe to the lower portion of said chamber, a pipe leading upward from said branch and having a valve-seat within the branch, the said valve-seats being adjustable in the branch, the said last-named pipe communicating with the upper portion of the hopper, a valve for engaging with the valve-seat, a swinging seat, a lever

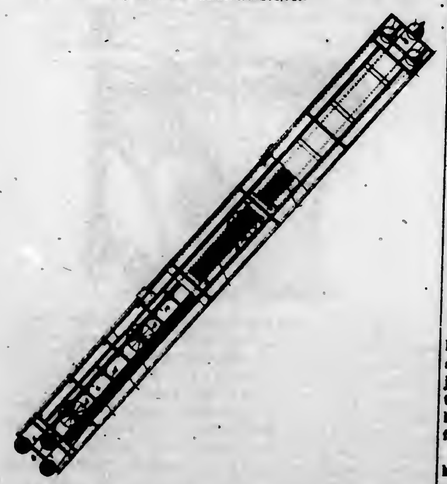
extended rearward from the seat, a stem for the valve, extending through said lever, a boxing, and a spring arranged between said boxing and said lever.

811,445. SHINGLE-FASTENING DEVICE. MARTIN M. SCHULLER, Chicago, Ill. Filed Mar. 6, 1905. Serial No. 248,695.

Claim.—1. A shingle-fastening device comprising a strip of sheet metal secured to the roof underneath the free ends of each row of shingles and provided with projecting tongues bent over upon the free end portions of said shingles, and projections on the free ends of said tongues adapted to be driven into said shingles to secure said tongues.

2. A shingle-fastening device comprising a strip of sheet metal secured to the roof underneath the free ends of each row of shingles, and provided with projecting tongues bent over upon the free end portions of said shingles, and V-shaped projections on the side edges of said tongues at their free ends adapted to be driven into the free end portions of said shingles to secure the same.

811,446. VENEER-DRIER. WALTER M. SCHWARTZ, Philadelphia, Pa. Filed July 20, 1905. Serial No. 271,747.



Claim.—1. A veneer-drying machine having, in combination, a drying-chamber casing, means for carrying the strips or sheets of veneer through said chamber and retaining them in a flattened condition during such travel, and means for causing passage of air across said flattened strips or sheets of veneer in a direction transverse to their direction of movement, substantially as specified.

2. A veneer-drying machine having, in combination, a drying-chamber casing, means for carrying the strips or sheets of veneer through said chamber and retaining them in a flattened condition during their travel, and means for causing flow of air across the drying-chamber, first in one direction and then in the opposite direction, substantially as specified.

3. A veneer-drying machine having, in combination, a drying-chamber casing, means for carrying the strips or sheets of veneer through said chamber and maintaining them in a flattened condition during their travel, and means for causing repeated reverse flows of air across the drying-chamber, substantially as specified.

4. A veneer-drying machine having, in combination, a drying-chamber casing, means for carrying the strips or sheets of veneer through said chamber and maintaining them in a flattened condition during such travel, the heating-chamber on one side of said casing, and means for drawing heated air from said chamber and forcing it across the drying-chamber in a direction transverse to the direction of movement of the veneer, substantially as specified.

5. A veneer-drying machine, having, in combination, a drying-chamber casing, endless aprons having conveyer-runs for carrying strips or sheets of veneer through said chamber, heating-chambers on opposite sides of the casing, and means for drawing air from said chambers and forcing it across the heating-chamber and across the conveyer-runs of the aprons therein, first in one direction and then in the opposite direction, substantially as specified.

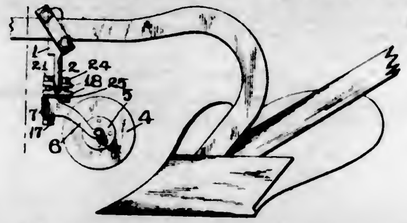
6. A veneer-drying apparatus, having, in combination, a drying-chamber casing, endless aprons having conveyer-runs carrying strips or sheets of veneer through said chamber, means for causing circulation of air across the chamber from side to side and means for withdrawing air from the chamber at intervals in its length, substantially as specified.

7. A veneer-drying apparatus, having, in combination, a drying-chamber casing, endless aprons having conveyer-runs for carrying strips or sheets of veneer through said chamber, and slatted supports for said conveyer-runs, substantially as specified.

8. A veneer-drying apparatus, having, in combination, a drying-chamber casing, endless aprons having conveyer-runs for carrying strips or sheets of veneer through said chamber, slatted supports on one side of said conveyer-runs and transverse rollers on the other side of the same, substantially as specified.

9. A veneer-drying apparatus, having, in combination, a drying-chamber casing, endless aprons having conveyer-runs for carrying strips or sheets of veneer through said chamber, and slatted supports for said conveyer-runs alternating with upper and lower rollers between which said conveyer-runs pass at intervals, substantially as specified.

811,447. ROLLING-COLTER STANDARD AND FORK ATTACHMENT. PHILIP A. SHANKLIN, Sandoval, Ill., assignor to James B. Taylor, Sandoval, Ill. Filed Oct. 18, 1905. Serial No. 283,336.



Claim.—1. The combination with a rolling-colter standard, having a horizontally-bent lower end, of a pair of blocks adjustably arranged upon the horizontal lower end, a bolt seated in and projecting downwardly from said blocks, conical bearings arranged on the projecting portion of said bolt, a fork pivotally mounted on said bolt between said bearings, and a rolling colter journaled in said fork; substantially as specified.

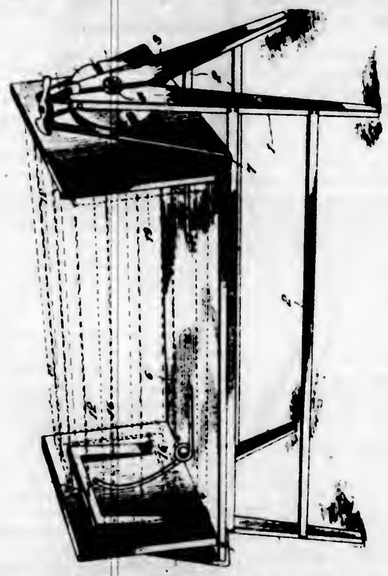
2. The combination with a rolling-colter standard, having a horizontally-bent lower end, of a pair of blocks adjustably arranged upon the horizontal lower end, a bolt seated in and projecting downwardly from said blocks, conical bearings arranged on the projecting portion of said bolt one of which bearings is removable, a fork pivotally mounted on said bolt between said bearings, and a rolling colter journaled in said fork; substantially as specified.

3. The combination with a rolling-colter standard, having a horizontally-bent lower end which horizontal end is circular in cross-section, of a pair of blocks mounted for adjustment on said horizontal end, locking-bolts passing through the ends of said blocks one of which bolts projects downwardly from the blocks, a fork pivotally mounted on the projecting portion of said bolt, and a rolling colter journaled in said fork; substantially as specified.

4. The combination with a rolling-colter standard, having a horizontally-bent lower end which is round in cross-section, of a pair of blocks adjustably arranged on said horizontal lower end, bolts passing through the ends of said blocks one of which bolts projects downwardly below the lower block, conical bearings on the projecting portion of said bolt, a fork pivotally arranged on said bolt between the conical bearings, and a rolling colter journaled in said fork; substantially as specified.

5. The combination with a rolling-colter standard, having a horizontally-bent lower end which is round in cross-section, of a pair of blocks adjustably arranged for adjustment on said horizontal lower end, bolts passing through the ends of the blocks one of which bolts extends downwardly below the lower block, a conical bearing formed integral with said extended bolt, a conical bearing removably mounted on the lower end of said bolt, a fork pivotally mounted on said bolt between the conical bearings, and a rolling colter journaled in said fork; substantially as specified.

811,448. CRATE-NAILING-UP FORM. JOHN SHELLENBERGER, Rome, Ga. Filed May 4, 1905. Serial No. 258,876.



Claim.—1. A device for use in assembling and nailing up crates comprising a form-frame, crate-end heads carried thereby and provided with ledges to receive the crate ends, and means to removably hold the crate ends to said heads and on said ledges.

2. In combination, a support, a form-frame provided with movable crate-end-receiving heads, spring devices carried by said frame to engage and clamp the crate ends to said heads and tending to move said heads outwardly from operative positions before said heads are secured together, and movable means for pressing said heads inwardly to operative positions and whereby said heads can be released for outward movement from operative positions to permit removal of the crate.

3. In combination, a form-frame, crate-end-receiving heads hinged thereto to swing toward and from each other, spring devices to clamp the crate ends to the inner faces of said heads, and movable means for swinging said heads toward each other to clamp the crate-bottom and sides between the same, and whereby said heads can be released and swung outwardly to permit removal of the crate, substantially as described.

4. In combination, a form-frame, crate-end-receiving heads mounted thereon and movable toward and from each other to receive the crate ends, sides and bottom and to release and permit removal of the crate, outwardly-yielding spring devices carried by the frame independently of and arranged at the inner faces of said heads to clamp the crate ends against the same, and movable means for pressing said heads toward each other and for removably holding the same in operative position, and whereby said heads can be released to permit outward movement thereof for releasing the crate therefrom, substantially as described.

5. In combination, a form-frame having lateral ends, crate-end-receiving heads arranged adjacent to the inner faces of said ends, respectively, and movable toward and from the same, spring-arms secured to said frame and arranged at and pressing toward the inner faces of said heads, respectively, and adapted to engage the inner faces of the crate ends and clamp the same to the inner faces of said heads, respectively, and swinging levers carried by said frame ends to engage said heads and hold the same to operative position, and whereby said heads can be released to permit outward movement thereof to release and permit removal of the crate.

6. In combination, a support, a rotary form-frame comprising a longitudinal base having lateral ends provided with trunnions turning in said support, the support and frame having a latch and series of spaced notches, whereby said frame can be rotated a partial revolution and locked by the latch entering a notch for the purposes described, movable crate-end-receiving heads mounted on said base between said ends thereof, means to detachably clamp the crate ends to said heads, and means for moving the heads to and holding the same in operative position, substantially as described.

7. In combination, a folding support comprising pairs of pivotally-joined end legs, each pair of legs forming a journal box or bearing when the legs are spread in operative position, a rotary form-frame having trunnions removably located in said journal-boxes, crate-end-receiving heads carried by said frame, and means for controlling said heads.

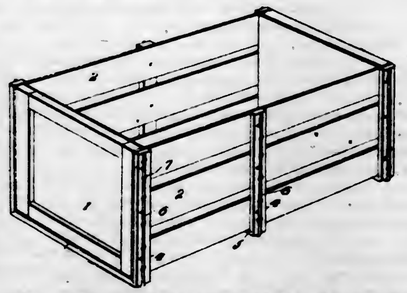
8. In combination, a form-frame, movable crate-end-receiving heads mounted on and carried by said frame and at their inner faces provided with crate-end-receiving shoulders or abutments, and means controlling the movement of said heads.

9. In combination, a form-frame, spaced crate-end-receiving heads carried thereby and each at its inner face provided with a crate-end-receiving shoulder or abutment comprising a horizontal and vertical portion depending from the ends thereof to fit three sides of the crate ends.

10. In combination, a form-frame, spaced movable crate-end-receiving heads, means controlling the movement thereof, each head at its inner face having a crate-end-receiving ledge comprising a horizontal portion and depending downwardly and inwardly beveled portions, and spring devices to detachably clamp the crate ends to said heads and on said ledges.

11. A device for use in assembling and nailing up boxes and crates comprising a form-frame having ends, crate-end-receiving heads pivotally joined to said frame, spring-arms arranged to act on the inner sides of said heads and adapted to detachably hold the crate ends thereto, and levers to limit the movements of said heads toward said ends, substantially as described.

811,449. FRUIT-CRATE. JOHN SHELLENBERGER, Rome, Ga. Filed May 31, 1905. Serial No. 263,129.



Claim.—1. A fruit-shipping crate comprising end heads, longitudinal-spaced bottom and side slats secured to said end heads, opposite end and intermediate parallel battens fitting the outer faces of and crossing and secured to said side and bottom slats and bent transversely to extend from the bottom slats upwardly across the side slats, and wires arranged longitudinally along the outer faces of said battens and secured thereto approximately throughout the lengths thereof, substantially as described.

2. In combination, in a ventilated fruit-shipping crate, end heads, a bottom and sides composed of spaced longitudinal slats secured to said end heads, battens secured to and extending across the slats and arranged at the outer faces thereof, each batten formed with transverse cuts across its inner side and extending the greater portion of the distance through the batten, each batten bent at said cuts to extend from the crate-bottom upwardly along the sides of the crate, the walls of each cut abutting against each other to form a miter-joint, and wires secured to the battens and extending longitudinally thereof and bridging said joints, substantially as described.

3. A shipping-crate comprising end heads, and a bottom and

sides lapping and secured to the edges of said end heads, said bottom and sides consisting of longitudinal slats, and several battens secured to the slats and arranged at the outer faces thereof, each batten extending transversely across the bottom and upwardly across the sides and having tapered cuts extending across the same forming miter-joints at the junctions between the sides and bottom and a wire secured longitudinally to the battens and bridging said joints, substantially as described.

4. As an article of manufacture, a flat sheet or series of slats adapted to be bent around and secured to crate ends to form the bottom and sides thereof and consisting of a series of separated or spaced longitudinal slats, and several battens extending across and secured to the outer faces of said slats, each batten at its inner face, between certain slats, having transverse flaring cuts extending the greater portion of the distance through the battens, and longitudinal wires secured along the outer faces of the battens approximately throughout the lengths thereof, substantially as described.

811,450. FEED-BAG. JAMES A. SKINNER, Denver, Colo. Filed Apr. 13, 1905. Serial No. 255,189.

Claim.—1. In a feed-bag, apertured guard-plates secured to the inner side portions of the bag, said plates being separated at the front, a connecting medium for the rear portions of the plates, and a cushion of yielding material carried by the said connecting medium.

2. In a feed-bag, apertured guard-plates secured to the inner side portions of the bag, which plates are separated at the front, and a connecting element having sliding relation to the guard-plates.

3. In a feed-bag, apertured guard-plates conforming to the contour of and secured to the inner side portions of the bag, which guard-plates are separated at the front of the bag, a connecting-plate at the rear of the bag, independent thereof and connected with and having end movement upon the rear portions of the guard-plates.

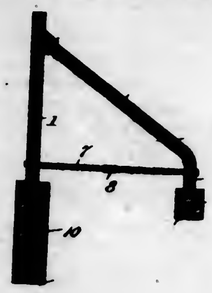
4. In a feed-bag, apertured guard-plates conforming to the contour of and secured to the inner side portions of the bag, which guard-plates are separated at the front of the bag, a connecting-plate at the rear of the bag, independent thereof and connected with and having end movement upon the rear portions of said guard-plates, and a cushion of a yielding material carried by the connecting-plate and extending beyond its forward edge.

5. In a feed-bag, apertured guard-plates horizontally located within the bag and secured to its inner side faces, the inner edges of the said guard-plates being concaved and their forward ends separated, their rear ends being provided with longitudinal slots, a connecting-plate the ends whereof extend over the slotted ends of the guard-plates, and pins secured to the connecting-plate, which pins are loosely passed through the slots in the guard-plates.

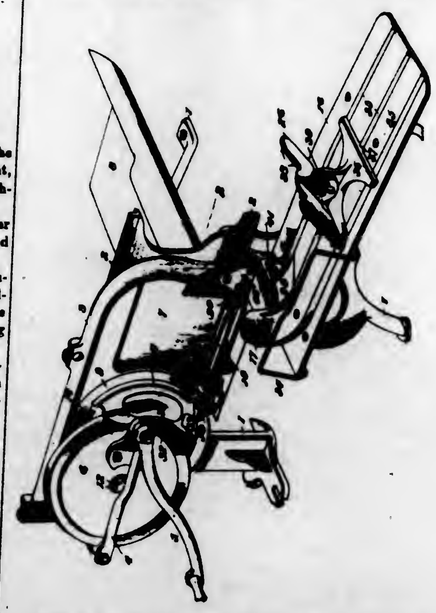
6. In a feed-bag, apertured guard-plates horizontally located within the bag and secured to its inner side faces, the inner edges of the said guard-plates being concaved and their forward ends separated, their rear ends being provided with longitudinal slots, a hinged connecting-plate, the ends whereof extend over the slotted ends of the guard-plates, pins secured to the connecting-plates and loosely passed through the slots in the guard-plates, and a cushion carried by the connecting-plate and extending beyond the forward edge of the same.

811,451. FENCE-POST. DELOS A. SMITH, Webberville, Mich. Filed Dec. 27, 1904. Serial No. 238,243.

Claim.—A fence-post hollow throughout its entire length and fully open at its ends, said post provided with an integrally-formed sleeve adjacent its upper end and with a horizontally-disposed supporting-flange at its lower end, a brace hollow throughout its entire length and fully open at its ends, one end of said brace being secured within said flange and bent intermediate its ends to dispose a portion thereof in vertical alinement with said post, a supporting-flange secured to the lower end of the brace, cement filling for the post and brace, cement bases secured above the lower ends of the post and brace and supported by said flanges, and a tie-wire uniting the post and brace.



811,452. SLICING-MACHINE. EDWARD F. SMITH, Rochester, N. Y., assignor to Josiah Anstice, Rochester, N. Y. Filed July 27, 1904. Serial No. 218,621.



Claim.—1. In a bread-slicer, the combination of a holder for the loaf, a movable cutter, a receiver for the cut slices arranged at right angles to the cutter and extending substantially parallel therewith, and a stacker receiving the cut slices separately in an edgewise position and delivering them separately to the said receiver.

2. In a bread-slicer, the combination of a holder for the loaf, a vertically-arranged horizontally-movable cutter, a horizontally-arranged receiver, a horizontally-movable stacker normally adjacent the cutter and adapted to receive the slices in an edgewise position, and means for moving the stacker with the cutter during its slicing action, and means for moving the stacker from the cutter to the receiver after the slicing ceases.

3. In a bread-slicer, the combination of a holder for the loaf, a horizontally-movable rotatable cutter, a receiver for the cut slices having its receiving end at one side of the point at which cutting ceases and extending in a direction parallel the cutter, and means for moving the cut slices from the cutter and delivering them to the receiver.

4. In a bread-slicer, the combination of a holder for the loaf, a receiver for the cut slices extending parallel the cutter, a stacker connected with the cutter and means for imparting to the stacker two movements, first one at right angles to the cutter to remove the slice from the cutter, and then one parallel the cutter to stack the slice on the receiver.

5. In a bread-slicer, the combination of a holder for the loaf, a receiver, a reciprocating stacker receiving each slice separately in an edgewise position and delivering it to the receiver independently of the previously-cut slices, and means for operating the stacker.

6. In a bread-slicer, the combination of a holder for the loaf, a movable cutter, a receiver for the cut slices adapted to support them in an edgewise position, a stacker normally adjacent the cutter and movable outward therefrom to deliver the cut slices to and stack them on the receiver.

7. In a bread-slicer, the combination of a holder for the loaf, a movable cutter, a receiver for the cut slices adapted to support them in an edgewise position, a movable stacker normally adjacent the cutter and means for moving the stacker from the cutter to the receiver to deliver the cut slices to the receiver.

8. In a bread-slicer, the combination of a holder for the loaf, a movable cutter, a receiver for the cut slices adapted to support them in an edgewise position, a stacker having a portion adjacent the cutter and extending in a plane parallel therewith, the stacker movable from the cutter to the receiver, and means for so moving the stacker.

9. In a bread-slicer, the combination of a holder for the loaf, a movable cutter, a receiver for the cut slices adapted to support them in an edgewise position, a swinging stacker movable with the cutter and means for moving the stacker away from the cutter when the slice has been cut and to the receiver for carrying the slice to the latter.

10. In a bread-slicer, the combination of a holder for the loaf, a vertically-arranged cutter movable in a horizontal direction, a horizontally-arranged receiver for the cut slices, a stacker having a vertically-arranged portion adjacent the cutter which is movable in a horizontal plane from the cutter to the receiver, and means for moving the stacker in said plane.

11. In a bread-slicer, the combination of a holder for the loaf, a movable cutter, a swinging stacker movable with the cutter, a receiver for the cut slices and a cam member adapted to swing the stacker from the cutter to the receiver.

12. In a bread-slicer, the combination of a holder for the loaf, a movable cutter, a receiver for the cut slices, a stacker normally adjacent the cutter and flared outwardly therefrom, and means for moving the stacker from the cutter to the receiver.

13. In a bread-slicer, the combination of a holder for the loaf, a movable cutter, a receiver adapted to receive the cut slices, a stacker carried with the cutter and normally adjacent thereto, the stacker flared outward in respect to the cutter and having a roughened portion adapted to engage the cut slice, and means for moving the stacker from the cutter to the receiver.

14. In a bread-slicer, the combination of a holder for the loaf, a reciprocating cutter-carrier, a cutter carried thereby, a receiver adapted to receive the cut slices and support them in an edgewise position, and a movable stacker supported by the carrier, a member supported independent of the carrier adapted to engage a portion of the stacker and through the movement of the carrier move the stacker from the cutter to the receiver.

15. In a bread-slicer, the combination of a holder for the loaf, a movable cutter, a receiver adapted to receive the cut slices and support them in an edgewise position, a swinging stacker carried with the cutter and normally adjacent thereto, a member supported independent of the cutter, the stacker having a member adapted to engage the first-mentioned member when moved with the cutter for moving the stacker from the cutter to the receiver.

16. In a bread-slicer, the combination of a holder for the loaf, a cutter-carrier, means for moving the carrier, a cutter supported by the carrier, a receiver adapted to receive the cut slices, a pivoted stacker supported by the carrier and normally adjacent the cutter, an eccentrically-arranged arm connected with the stacker, and a member supported independent of the carrier and located in the path traveled by said arm, whereby the engagement of the arm with the member causes the stacker to swing from the cutter to the receiver.

17. In a slicer, the combination of a holder for the loaf, a movable cutter, a receiver located at the point at which cutting ceases, a stacker pivoted at a point in advance of the cutter and carried therewith, and means for swinging the stacker on its pivotal point to move it from the cutter to the receiver.

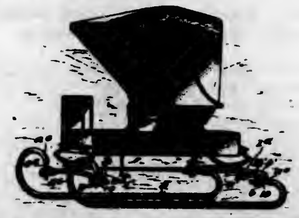
18. In a bread-slicer, the combination of a holder for the loaf, a movable cutter, a receiver for the cut slices, a swinging stacker carried with the cutter and having a portion adjacent the cutter, the pivotal spindle of the stacker having a laterally-extending arm, and a member having a cam-slot with which the said arm is adapted to engage by the movement of the cutter and stacker, whereby the stacker is moved from the cutter to the receiver.

19. In a bread-slicer, the combination of a holder for the loaf, a laterally-movable cutter, a receiver adapted to receive the cut slices, a swinging stacker carried with the laterally-movable cutter and having a vertical portion, a spring adapted to hold the vertical portion adjacent the cutter, and means adapted to move the stacker from the cutter to the receiver through the medium of the movement of the cutter.

20. In a bread-slicer, the combination of a holder for the loaf, a movable cutter, a receiver having longitudinal ribs adapted to receive the cut slices, the receiver having its rear portion declined, a shelf movable on the receiver, and means independent of the shelf for delivering the cut slices on the ribs of the receiver and against the said shelf.

21. In a bread-slicing machine, the combination of a holder for the loaf, a movable cutter, a receiver for the cut slices, a stacker having two movements, first one in a direction transverse the cutter to move the slices away from the cutter, and secondly one in a direction longitudinal the cutter to carry the slice to and move it upon the receiver, and means for moving the stacker.

811,453. CAB-RUNNER. JAMES W. SORENSEN, Grayling, Mich. Filed Feb. 6, 1905. Serial No. 244,670.



Claim.—1. A runner of the character described, having upwardly-curved front and rear ends, the front end having a downwardly-curved portion terminating in a vertically-pendent shank, rectangular in cross-section, the rear end terminating in an inwardly-extending horizontal shank, rectangular in cross-section and socket members for receiving the axle-spindles, said socket members having rectangular apertures to receive the vertical and horizontal shanks and set-screws for holding the same in their adjusted positions, substantially as shown and described.

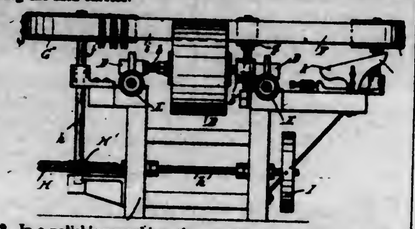
2. A runner of the character described having its front end curved upwardly, backwardly and downwardly and terminating in a vertical shank having a plurality of adjusting-apertures and said runner having its rear end curved upwardly and terminating in an inwardly-extending horizontal shank, T-shaped bearing-boxes slidable on either shank ends, said bearing-boxes having set-screws for clamping them in their different adjustments and having portions to receive the axle-spindles, substantially as shown and described.

3. A runner of the character described having its front end bent into a circular shape and terminating into a vertical downwardly-projecting shank portion rectangular in cross-section and having its rear end bent up into a semicircle and terminating in an inwardly-projecting horizontal shank portion, rectangular in cross-section, and a pair of T-shaped socket members each consisting of a cylindrical bearing portion to receive an axle-spindle, a set-screw for co-operating with said bearing portion and each of said bearing members having squared apertures for receiving the shank portions of the runners, and a set-screw for co-operating with said squared apertures for holding the bearing members adjustably on the runners, substantially as shown and described.

811,454. POLISHING-MACHINE. JAMES A. STOWELL, Leominster, Mass. Filed Mar. 16, 1905. Serial No. 250,251.

Claim.—1. In a polishing-machine, the combination, with a pair of cylindrical polishing-wheels having their axes arranged in a horizontal plane, and means for revolving the said wheels; of an endless carrier having a straight portion arranged edgewise over the adjacent surfaces of the said wheels and sliding in a horizontal plane par-

allel with the axes of the said wheels, and means for supporting and driving the said carrier.



2. In a polishing-machine, the combination, with a pair of cylindrical polishing-wheels having their axes arranged in a horizontal plane, and means for revolving the said wheels; of an endless carrier having a straight portion arranged edgewise over the adjacent surfaces of the said wheels and sliding in a horizontal plane parallel with the axes of the said wheels, means for supporting and driving the said carrier, and a series of supporting-hooks secured crosswise of the said carrier and projecting below its bottom edge.

3. In a polishing-machine, the combination, with an endless carrier for supporting the articles to be polished, and a series of supporting-hooks secured to the said carrier; of means for supporting and driving the said carrier, and a knock-off plate for the articles having one end portion curved and arranged crosswise under the said carrier.

811,455. **NECKTIE-FASTENER.** ALFRED SWANSON, Albuquerque, N. Mex. Filed May 29, 1905. Serial No. 263,067.

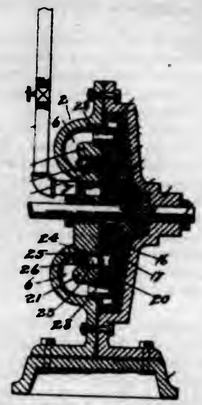
Claim.—1. In combination with a plate for attachment to the inner side of a necktie, bent longitudinally, with its upper and lower portions at an angle with respect to each other, and further provided in the upper central portion with an inclined opening, a button having a flat stem provided at its outer end with a flat head for insertion through the opening in the plate and to lie under the overhanging upper portion thereof, said button having a cap at the inner end of its stem.

2. In combination with a plate for attachment to the inner side of a necktie, bent longitudinally, with its upper and lower portions at an angle with respect to each other, and further provided in the upper central portion with an inclined opening, a button having a flat stem provided at its outer end with a flat head for insertion through the opening in the plate to lie under the overhanging upper portion thereof, said button having a yoke-head at the inner end of its stem, and a cap in said yoke-head comprising an outer and an inner plate connected together at their ends and between which plates the yoke-head of the button-stem is placed, the outer plate having a transverse corrugation at its center for the reception of the yoke-head, and the inner plate having a slot to clear the stem and permit angular movement of the cap on the stem.

811,456. **SHINGLE-PRESS.** JOHN W. TRUMBOUR, Maple Falls, Wash. Filed Apr. 28, 1904. Serial No. 204,857.

Claim.—A machine for re-pressing shingles, consisting of framing having a bumper and having in advance thereof an open seat for the bundle of shingles and, on the opposite side of said seat from the bumper, a cylinder, a follower and a piston operating in the cylinder and connected with the follower, spring devices for retracting the follower, a pipe leading to the cylinder for conducting steam to and from the cylinder, said pipe having an exhaust branch, and a three-way valve controlling the power-pipe and exhaust branch all substantially as described, whereby steam may be readily admitted to and exhausted from the cylinder to effect a rapid advance of the follower and a quick return thereof by the retracting-springs whereby the bundle of shingles may be struck repeatedly by the follower to effect a re-pressing thereof, substantially as set forth.

811,457. **TURBINE STEAM-ENGINE.** TIMOTHY S. THOMAS, Washington, D. C., assignor of two-thirds to Thomas F. Holden and John Leetch, Washington, D. C. Filed Jan. 13, 1906. Serial No. 295,722.



Claim.—1. A steam-turbine comprising a casing, a rotary element therein having an inner and an outer set of vanes, a partition between said sets of vanes, and oppositely-disposed expansion-chambers spanning said partition.

2. In a steam-turbine, a casing, a rotary element mounted to revolve therein, and provided with two sets of vanes, an expansion-chamber between the two sets of vanes, and an accelerator within said expansion-chamber.

3. In a steam-turbine, a casing, a rotary element therein, the latter provided with two sets of vanes, an expansion-chamber between said sets of vanes, nozzles in said expansion-chamber and an accelerator in said expansion-chamber.

4. A steam-turbine comprising a casing, a rotary element therein having two sets of vanes, a partition between said sets of vanes, a semicircular expansion-chamber spanning said partition, nozzles in said expansion-chamber, and an accelerator in said chamber.

5. A steam-turbine comprising a casing, a rotary element therein having two sets of vanes, a partition between said sets of vanes, oppositely-disposed curved expansion-chambers spanning said partition, and an accelerator in one of said expansion-chambers, substantially as described.

6. A steam-turbine comprising a casing, a rotary element therein having two sets of vanes, and two oppositely-disposed expansion-chambers connecting the two sets of vanes.

811,458. **AUTOMATIC IGNITER FOR MATCH-BOXES.** JOSEPH S. URBAN, Indianapolis, Ind., assignor of one-half to Andrew Edward Nibling, Indianapolis, Ind. Filed June 20, 1905. Serial No. 266,114.

Claim.—1. The combination with a match-box having an opening in its bottom, of a narrow bent-spring igniter attachment having a spring engagement with opposite narrow side walls of the box, one branch of said igniter attachment having a serrated end portion adapted to engage the opening in the bottom of the box, substantially as specified.

2. The combination with a match-box having a small opening in its bottom near one narrow side wall, of a narrow bent-spring igniter attachment having divergent branches having a spring engagement with opposite narrow side walls of the box, one branch of said attachment having a serrated end portion adapted to engage the opening in the bottom of the box, substantially as specified.

3. The combination with a match-box having an opening in its bottom, of a narrow bent-spring igniter attachment having its bend at the top of the box and provided with a branch engaging a narrow side wall of the box and having a serrated end portion adapted to engage the opening in the bottom of the box, substantially as specified.

4. The combination with a match-box having an opening in its bottom and an opening in a narrow side wall thereof, of a narrow bent-spring igniter attachment having its bend at the top of the box, one branch of said attachment having a press-lug engaging the opening in the side wall of the box, said branch having a serrated end portion adapted to engage the opening in the bottom of the box, substantially as specified.

5. The combination with a match-box having an opening in its bottom, of a narrow bent-spring igniter attachment having its bend at the top of the box, one branch of said attachment engaging a narrow side wall of the box and having a serrated end portion adapted to engage the opening in the bottom of the box, the other branch of said attachment being adapted to engage a lug of the cover to open and close the same and hold it in place, substantially as specified.

6. The combination with a match-box having a removable cover, of a spring igniter attachment having a long igniter branch provided with a serrated end portion, and a short spring branch engaging a lug of said cover, and adapted to open and close the same and to hold it in place, substantially as specified.

7. The combination with a match-box, having the body thereof provided with open journal-seats, and a separable cover having a lug provided with lateral journal extensions fitting in said seats, of an igniter attachment having a spring-arm engaging the lug of the cover, substantially as specified.

811,459. **CAR-COUPLING.** JOSEPH K. VAUGHT, Hinnebohton, Texas., assignor of one-half to William M. Vaught, Hinnebohton, Texas. Filed Sept. 12, 1905. Serial No. 278,091.

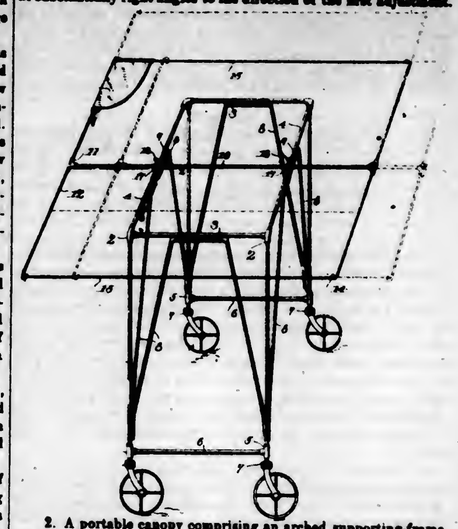
Claim.—1. In a car-coupling, a draw-head, a knuckle pivoted to said draw-head, a tongue on said knuckle and projecting into the draw-head, a vertically-movable pin mounted in said draw-head for engaging said tongue to hold the knuckle in a locked position, and friction-rolls mounted in said pin and projecting from opposite sides of the same to bear against the tongue and the draw-head when the knuckle is in a locked position.

2. In a car-coupling, a draw-head, a knuckle pivoted to said draw-head, a tongue on said knuckle and projecting into the draw-head, a vertically-movable pin mounted in said draw-head for engaging said tongue to hold the knuckle in a locked position, and friction-rolls bearing against each other mounted in said pin and projecting from opposite sides of the same to bear against the tongue and the draw-head when the knuckle is in a locked position.

3. In a car-coupling, a draw-head, a knuckle pivoted to said draw-head, a tongue on said knuckle and projecting into the draw-head, a vertically-movable pin mounted in said draw-head for engaging said tongue to hold the knuckle in a locked position and comprising a main body part contained within said draw-head and provided with shoulders at opposite ends of said body part to limit the movement of the pin, friction-rolls journaled in the main body part of the pin and projecting from opposite sides of the same to bear against the end of the tongue and the draw-head, and a tail on said tongue to engage with the shoulder on the lower end of the body part of the pin to hold said pin in a raised position when the knuckle is turned outwardly.

811,460. **PORTABLE CANOPY.** ALBERT VOSSMER, New Davis, Ia. Filed Apr. 22, 1905. Serial No. 256,436.

Claim.—1. A portable canopy comprising a supporting-frame, a canopy upon the supporting-frame, means to permit adjustment of the canopy horizontally in one direction across the frame, and other means to permit adjustment of the canopy horizontally in a direction at substantially right angles to the direction of the first adjustment.



2. A portable canopy comprising an arched supporting-frame, and a canopy-frame including a longitudinal bar sustained across the top of the supporting-frame and adjustable endwise thereon, end bars carried by the longitudinal bar and shiftable endwise across the same, and a canopy carried by the end bars and shiftable therewith.

3. A portable canopy comprising an arched supporting-frame having a seat upon the top thereof, a substantially horizontal longitudinal bar supported in the seat and adjustable endwise thereof, means to adjustably fix the bar in the seat, seats upon the ends of the longitudinal bar, cross-bars adjustable endwise through the seats, means to adjustably fix the cross-bars in their seats, and a canopy carried by the cross-bars.

4. A portable canopy comprising an arched supporting-frame, a seat carried by the top of the frame, a longitudinal bar carried by and adjustable endwise through the seat, a set-screw carried by the seat for adjustably fixing the longitudinal bar in the seat, T-couplings carried by the ends of the longitudinal bar, cross-bars shiftable endwise through the couplings, set-screws carried by the couplings to adjustably fix the cross-bars therein, and a canopy carried by the cross-bars.

5. A portable canopy comprising a supporting-frame, a substantially horizontal canopy carried by the frame, and means to permit of the canopy being adjusted horizontally in directions at substantially right angles across the supporting-frame

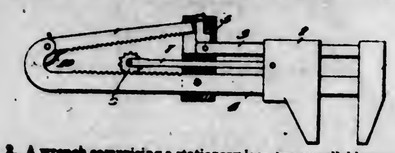
6. A portable canopy comprising an arched supporting-frame, a longitudinal bar supported upon the top of the frame and projected at opposite sides thereof, cross-bars carried by the ends of the longitudinal bar and shiftable endwise thereacross, and a canopy carried by the cross-bars.

7. A portable canopy comprising an arched supporting-frame, upstanding eyebolts piercing the top of the frame, a longitudinal bar shiftable endwise through the eyebolts, set-screws piercing the eyebolts to adjustably fix the longitudinal bar therein, cross-bars carried by the ends of the longitudinal bar, and a canopy carried by the end bars.

8. A portable canopy including an arched supporting-frame made up of corner-posts, upper frame-bars connecting the posts, inverted substantially U-shaped braces extending between the respective front and rear pairs of posts and the front and rear top frame-bars, lower frame-bars extending between the front and rear posts, an endwise-adjustable substantially horizontal bar carried by the top frame-bars and projected in front and rear thereof, endwise-adjustable cross-bars carried by the ends of the longitudinal bar, and a canopy carried by the cross-bars.

811,461. **WRENCH.** BENJAMIN R. WAGY, Wichita, Kans. Filed May 26, 1905. Serial No. 262,454.

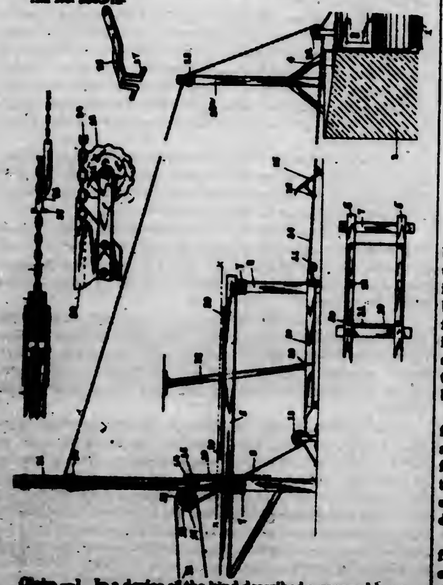
Claim.—1. A wrench comprising a stationary jaw, two parallel bars projecting therefrom, a movable jaw slidably mounted on said bars, one bar extending but a portion of the length of the other bar, the extended portion of the latter being toothed, a housing to which the shorter bar is secured, a bar pivotally secured at one end to the outer end of said longer bar and also having teeth, means for securing the free end of said pivoted bar to said housing, a rod extending from said movable jaw intermediate said long and short bars, and a pinion on the outer end of said rod working in said teeth, as set forth.



2. A wrench comprising a stationary jaw, two parallel bars projecting therefrom, a movable jaw slidably mounted on said bars, one bar extending but a portion of the length of the other bar, the extended portion of the latter being toothed, a housing secured on said long bar and to which said shorter bar is secured, a bar pivotally secured at one end to the outer end of said longer bar and having teeth on its inner face opposite those of the longer bar, a catch mounted in said housing for engaging and holding the free end of said pivoted bar, a spring acting on the latter, a rod secured to said movable jaw and extended loosely through said housing, and a pinion on the end of said rod engaging the teeth of the pivoted bar and said longer bar, as set forth.

3. The combination with the stationary jaw, and the long and short bars projecting therefrom, of the movable jaw slidably mounted on said bars, said longer bar having rack-teeth on its inner face and being curved or bent at its outer end, a housing to which said shorter bar is secured, a bar pivotally secured to the bent or curved end of said longer bar and having rack-teeth on its inner face, a spring acting on said bar, a spring-pressed catch mounted in said housing for engaging and holding the free end of said pivoted bar, a rod secured to said movable jaw, and a pinion on the outer end of said rod meshing with the teeth of said longer bar and the teeth of said pivoted bar, as set forth.

811,462. CONVEYER. HOYT M. WHITMORE, Stockton, Cal., assignor to William P. Steinbeck, Stockton, Cal. Filed Oct. 2, 1905. Serial No. 280,975.

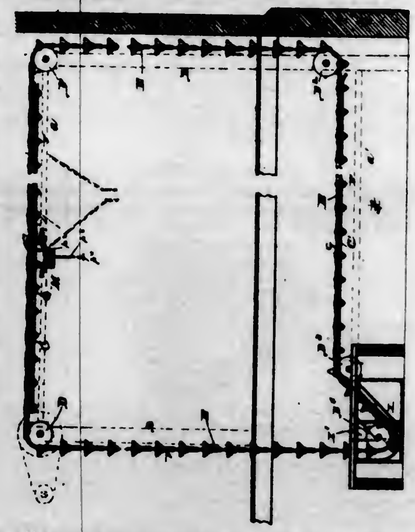


Claim.—1. In a device of the kind described a grooved beam, a chain-pulley at each end of said beam, a shafter pulley arranged in a higher plane than said last-named pulleys, a chain-pulley arranged on a boat or barge, an idler arranged on a higher plane than said last-named pulley, an endless chain working in said pulleys, and hooks adapted to be connected to a truck or similar device and to engage with said chain, as specified.

2. In a device of the kind described the combination of a grooved beam, a chain-pulley at each end thereof, the front one of said pulleys having corrugations on its face, two pulleys arranged on a higher plane than said last-named pulleys one on a slightly higher plane than the other, a chain-pulley arranged at a distance from said first-named pulleys, an idler arranged in a higher plane than said last-named pulley, an endless chain arranged on said pulleys and idler, means for applying motive power to said pulleys, a hook adapted to be fastened to a truck or other device and to engage with said chain, said hook being provided with two lugs adapted to coact with said corrugations, and means for stopping the chain when said lugs do not coact with said corrugations, as set forth fully herein.

3. A means for unloading boats comprising the combination of a boat or barge, an endless chain connecting said boat or barge to a point on shore, means for applying motive power to said endless chain, a truck, a hook attached to the leg of said truck and adapted to engage with said chain, and means for disengaging said hook from said chain automatically, as for the purpose set forth herein.

811,463. CONVEYER. ALFRED J. WHEELER, Columbus, Ohio, assignor to Joseph A. Jeffrey, Columbus, Ohio. Filed Apr. 6, 1896. Serial No. 576,667.



Claim.—1. In a conveyer, the combination of the chains, the buckets, each hinged to the chains upon a single axis passing through the bucket and which is fixed relatively to the chain, the buckets being free to rotate entirely around the said axes, a loading hopper or boot in the path of the buckets, and means independent of the chains for engaging with the buckets and tilting them to bring their scooping sides to an angle to the chain and hopper-bottom substantially as set forth, whereby the buckets as they pass through the boot scoop their loads successively and the chain exerts draft directly upon the buckets on lines passing directly through them, as described.

2. In a conveyer the combination of the chains, the buckets freely hinged to the chains, the projections H carried by the buckets and disposed entirely to one side of and at a considerable distance from the hinge connections between the buckets and the chains, and the means independent of the chains with which the said projections engage for tilting the buckets and maintaining them in tilted position during a portion of the run of the conveyer, substantially as set forth.

3. In a conveyer the combination of the chains, the buckets freely hinged thereto, and the laterally-extending projections H secured to the buckets near their bottoms, and means independent of the chains with which the said projections engage for tilting the buckets and maintaining them in the tilted position during a portion of the run of the conveyer, substantially as set forth.

4. In a conveyer the combination of the chains, the buckets, freely hinged to the chains, the projections carried by the buckets, and means arranged adjacent to the chains and moving in a direction approximately parallel to the parts of the chains to which they are adjacent, with which the said projections engage for tilting the buckets, substantially as set forth.

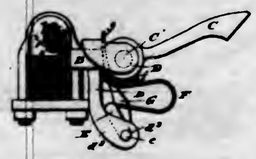
5. In a conveyer the combination of the chains, means for moving them, the buckets freely hinged to the chains, projections carried by the buckets, means adjacent to the chains and moving in a direction substantially parallel with the lines of movements of those portions of the chains to which they are adjacent, and with which means the said projections engage for tilting the buckets, and means with which the projections engage for maintaining the inclination of the buckets after they have been so tilted during a portion of the run of the conveyer, substantially as set forth.

6. In a conveyer, the combination of the chains, the buckets freely hinged and suspended thereon, the runway for the idle part of the conveyer having a track or support for the buckets, the runway for the loaded part of the conveyer having a track or support for the buckets, the boot or hopper intermediate of the said runways, a guide supplemental to said track for the buckets into the said hopper, and means independent of the chains for locking them on their hinges as they move through or into the said hopper, substantially as set forth.

7. In a conveyer, the combination of the chains, the buckets freely hinged and suspended thereon, the runway for the idle part of the conveyer having a support for the buckets, the runway for the loaded part of the conveyer having a support for the loaded buckets, a boot or hopper intermediate of the said runways, a guide supplemental to said support for the buckets to direct them through the said boot or hopper, a supplemental stationary guide, and means carried by the bucket engaging with said supplemental guide and holding the buckets rigid relatively to their hinges on the chain, substantially as set forth.

8. In a conveyer, the combination of the chains, the buckets freely hinged and suspended thereon, the supporting or traction wheels for the buckets, the track-section for the wheels of the unloaded part of the conveyer, the track-section for the wheels of the loaded part of the conveyer, a bucket-loading chamber intermediate of the said track-sections, a track-section for the bucket-wheels inclined to the aforesaid track-sections and extending through or into the loading-chamber, and means independent of the chains for locking the buckets upon their hinges while the bucket-wheels are on said inclined track-section, substantially as set forth.

811,464. THILL-COUPLING. FREDERICK A. WHEELER, Detroit, Mich. Filed Apr. 13, 1901. Renewed Dec. 16, 1905. Serial No. 292,155.



Claim.—1. In a thill-coupler, the combination with a clip, ears projecting therefrom, and a thill-iron, of a coupling member consisting of a shank portion located in and extending through the space between the said clip, ears, and a thill-iron, projecting portions extending from the upper end of said shank adapted to bear upon the upper side of the thill-iron, a member pivoted to the lower end of said shank portion, and a resilient member adapted to be compressed between said pivoted member and the thill-iron, substantially as set forth.

2. In a thill-coupler, the combination with a clip, its ears and a thill-iron, of a coupling member fashioned to move between the ears in the space between the thill-iron and clip, and having pintle-retaining projections, means for locking the coupler in position comprising a pivoted member, and a spring adapted to be compressed by said pivotal member between the same and the thill-iron, substantially as described.

3. In a thill-coupling, the combination with a clip having retaining-ears and a thill-iron, of a coupler comprising a frame having a portion fitted between the thill-iron and the clip and extending above the same, pintle-retaining fingers extending from the frame, and means for locking the frame against movement comprising a yielding member and a locking member pivoted to said portion of the coupler which is fitted between the clip and the thill-iron, said locking member arranged to be thrown backward beyond its pivotal center and against the tension of the yielding member, substantially as described.

4. In a thill-coupler, a coupling-frame comprising a shank member fashioned to fit in the space between the thill-iron and the clip, retaining-fingers projecting out from the shank, arms on the opposite end of the shank, a pivoted frame carried by the arms and a curved spring carried by the frame, adapted to be pressed against the under surface of the thill-iron in its adjusted position, substantially as described.

5. In a thill-coupler, a coupling-frame comprising a shank member, fashioned to fit in between the space between the thill-iron and the clip, retaining-fingers projecting outward from the upper end of the shank on opposite sides, outwardly-diverging arms at the lower end of the shank, a pivoted frame carried by the arms, a curved spring pivotally supported on the frame, and adapted to be pressed thereby against the thill-iron, and a lever on the frame for adjusting the parts, to their operative positions, substantially as described.

6. In a thill-coupler, the combination with a clip, its ears and a thill-iron, of a coupling member fashioned to move between the ears back of the thill-iron and provided with pintle-retaining projections, means for locking the coupler in position comprising a pivoted member and a yielding member, and means associated with the upper part of the coupling member for adjusting the same in its relation to the ears and pressing the yielding member against the thill-iron, substantially as described.

7. The combination with a thill-coupler, comprising the axle-clip, its ears and the thill-iron, of a coupler located in and extending through the space between the said parts, said coupler provided at its upper end with means adapted to bear on the upper side of the thill-iron and provided at its lower end with a pivoted member adapted to be thrown backwardly beyond its pivotal center to lock the coupler in place, substantially as described.

8. As an article of manufacture, a thill-coupling comprising, a shank portion adapted to be located in and extend through the space between the clip and the thill-iron, projections extending from one end of said shank portion, a member pivoted to the other end of said shank portion, and adapted to be swung backwardly between its pivot and said projections, and a resilient member eccentrically secured to said pivoted member, substantially as described.

9. In a thill-coupler, the combination with a clip, its ears and a thill-iron, of a coupling member fashioned to move between the ears back of the thill-iron, extensions secured to the upper portion of said coupling and overlying the ears of the clip, a pair of ears secured to the lower portion of said coupling member and underlying the ears of the clip, pintle-retaining members projecting outwardly from the outer ends of the extensions on the upper portion of the coupling member, and means for locking the coupling member against movement comprising a lever pivoted between the ears secured to the lower portion of the coupling member and a spring adapted to be compressed by said lever between the same and the thill-iron.

811,465. SHADE-SUPPORTING DEVICE. AUGUST WIESOLECK, West New Brighton, N. Y. Filed Aug. 28, 1905. Serial No. 276,429.

Claim.—A shade-supporting device comprising a notched bar having a laterally-offset integral perforated attaching-plate at one end, an angle-bracket comprising a metallic plate bent to form a right angle, said plate having a perforation in one end to receive the notched bar, a block slidably mounted upon the notched bar, a spring-pressed pawl mounted upon the block and adapted to engage the notched bar, and a supporting-arm formed integral with the block, said arm being of less thickness than the block.

811,466. FOOD COMPOUND AND METHOD OF PREPARING THE SAME. EDWARD T. WILLIAMS, Boston, Mass. Filed July 17, 1905. Serial No. 270,121.

Claim.—1. A food compound comprising animal tissue or matter, stearin, and a fat having a melting-point lower than the melting-point of stearin.

2. A food compound comprising comminuted animal tissue or matter, stearin, and a fat having a melting-point lower than the

melting-point of stearin; the stearin and other fat being thoroughly mixed with the comminuted animal tissue or matter.

2. A food compound comprising comminuted animal tissue or matter, stearin, and tallow; the said animal tissue, stearin and tallow being thoroughly mixed; in substance as set forth.

4. The method of preparing a food compound consisting in first, subjecting animal tissue to a temperature of 212° Fahrenheit to destroy the germs of putrefaction; and secondly, mixing the said animal tissue with a sterilized compound of stearin and a fat of a lower melting-point than stearin.

5. The method of preparing a food compound consisting in first, subjecting animal tissue to a temperature of 212° Fahrenheit to destroy the germs of putrefaction; comminuting the animal tissue; and finally mixing with the said comminuted tissue, sterilized stearin and tallow.

811,467. **BALL-CASTER.** JOHN WOLFE and GEORGE F. FISHER, Cincinnati, Ohio. Filed Nov. 3, 1904. Serial No. 231,906.

Claim.—A caster comprising a cup containing a ball and having spaced laterally-extending flanges, and a ball-retaining ring fitting on the cup and having spaced laterally-extending flanges arranged to fit in the spaces between the flanges on the cup.

811,468. **HYDRAULIC RIVETING-MACHINE.** WILLIAM H. WOOD, Media, Pa. Filed Nov. 26, 1904. Serial No. 234,372.

Claim.—1. A machine of the character described, comprising a driving-head, a number of pistons of different diameters practically formed in continuation one of the other, and having abutting hollow prolongations, a rod-bolt connected to one of said pistons and extending through the other of said pistons and connected to said driving-head, binding said pistons and the latter all solidly together, a cylinder member having chambers or cylinders receiving said pistons, and means for supplying hydrostatic pressure to said pistons.

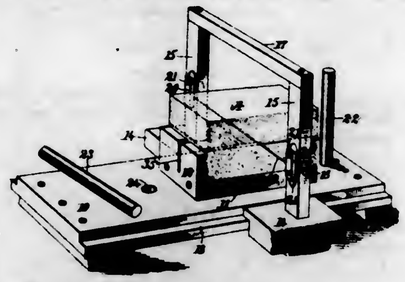
2. A machine of the character described, comprising a driving-head, a number of pistons of different diameters and having abutting hollow prolongations and practically formed in continuation one of the other, a rod-bolt connecting with one of said pistons and passing through the other of said pistons and connected to said driving-head binding said pistons and the latter all solidly together, a cylinder member having chambers receiving said pistons, a push-back piston and its cylinder, the latter being secured upon the head end of said cylinder member and the former being connected to one of the aforesaid pistons.

3. A machine of the character described, comprising a driving-head, a number of pistons of different diameters, the larger having a rearward prolongation abutting a forward extension of the smaller, and a rod-bolt secured to said smaller piston and extending through the larger piston and its prolongation and secured to said driving-head, effecting a fixed connection between said pistons and said driving-head and between said pistons themselves, a casing having chambers receiving said pistons and said driving-head.

4. A machine of the character described, comprising a driving-head, a cylinder member consisting of a chambered head and a forward prolongation or extension of said head, having an upward-opening chamber, said prolongation having formed therewith, some distance beyond said head a bridge or housing, combining with said elongation to constitute a closed stopped chamber, a number of pistons of different diameters practically forming a continuation one of the other, one piston working in said chambered head and partially occupying said upward-opening chamber and the other of said pistons working in said closed chamber and also partially occupying said upward-opening chamber, and means connecting said pistons and driving-head all solidly together, and means for supplying hydraulic pressure to said pistons.

5. A machine of the character described, comprising a driving-head, a cylinder member consisting of a chambered head and a forward prolongation or extension of said head, having an upward-opening chamber, said prolongation having formed therewith, some distance beyond and forward of said head, a bridge or housing combining with said prolongation to constitute a closed stopped chamber, a number of pistons of different diameters practically forming a continuation one of the other, one piston arranged in said chambered head and partially in said upward-opening chamber, and the other of said pistons arranged in said closed chamber and also partially in said upward-opening chamber, a push-back piston and its cylinder the former being connected to one of the aforesaid pistons and the latter being secured upon said head, means for connecting the aforesaid piston and driving-head all solidly together, and means for supplying hydraulic pressure to said pistons.

811,469. **BUTTER-CUTTER.** ROBERT J. WOOLLEY, Portland, Oreg. Filed May 10, 1905. Serial No. 259,693.



Claim.—1. The combination with a base, of a support mounted thereon, cutters movable horizontally and vertically above said support, and guides for one cutter constituting stops for the other.

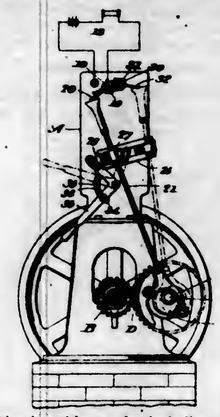
2. The combination with a base, of a support mounted thereon, cutters movable horizontally and vertically above said support, and guides for the vertically-movable cutter constituting stops for that moving horizontally.

3. The combination with a base provided with opposite ways, of standards movable along the ways, a connection between the standards below the base, a cutter extending between the standards above the base, and uprights carried by the base at each side of the cutter, one of said uprights being removable from the base.

4. In a butter-cutter, a frame having parallel grooves, studs situated upon opposite sides of the grooves, wires extending between the studs, and cleats cooperating with the grooves and engaging the wires.

811,470. **SPARKING DEVICE FOR ENGINES.** JAMES B. WORTH and WILLIAM B. BYRD, Pamplin, Va. Filed May 15, 1905. Serial No. 260,656.

Claim.—1. The combination in a sparker, of a pair of electrodes, one of which is movable, a rock-shaft carrying the movable electrode, a yieldable arm connected to the rock-shaft, a second shaft, also having a yieldable arm, means for connecting the two shafts, and an operating-rod adjustable to engage one or other of said arms.



2. The combination with a sparker including a rock-shaft carrying one of the electrodes, a gear secured to the rock-shaft, a yieldable arm extending from the gear, a second gear intermeshing with the first and also having a yieldable arm, and an operating-rod adjustable to engage one or other of said arms.

3. The combination in a sparker, of a rock-shaft carrying one of the electrodes, a gear secured to the rock-shaft, a yieldable arm projecting from the gear, a second gear engaging the first and also having a yieldable arm, a rod operated from the engine, and a rod-guide adjustable to direct the rod into engagement with one or other of the arms.

4. In a sparker, a rock-shaft, a gear connected thereto, an arm extending from the gear, a second gear intermeshing with the first and provided with an extending arm, an endwise-movable rod operable from the engine, a guiding member for said rod, and means for adjusting the position of said guiding member to direct the rod into engagement with one or other of the arms.

5. The combination in a sparker, of a rock-shaft, an electrode carried thereby, a gear-wheel connected to the rock-shaft, an arm extending from the gear, a second gear intermeshing with the first and also having an extending arm, an endwise-movable rod operated from the engine, a guide, a slidable block mounted thereon, and a pivotally-mounted rod-guiding member connected to said block.

6. The combination in a sparker, of a rock-shaft, an electrode connected thereto, a gear secured to the rock-shaft, an arm extending from the gear, a second gear intermeshing with the first, and also provided with a projecting arm, an endwise-movable rod operated from the engine, a guide, a slidable block mounted therein, an adjusting-lever connected to said block, means for locking the adjusting-lever in position, and a pivotally-mounted rod-guiding member carried by said block.

811,471. **ANTHRACENE DYE AND PROCESS OF MAKING SAME.** OSCAR BALLY, Mannheim, and HUGO WOLFF, Ludwigshafen-on-the-Rhine, Germany, assignors to Badische Anilin & Soda Fabrik, Ludwigshafen-on-the-Rhine, Germany, a Corporation. Filed Oct. 10, 1905. Serial No. 282,185.

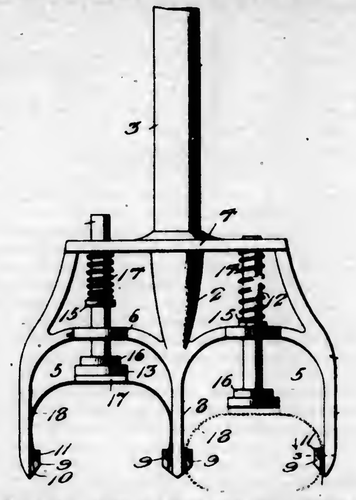
Claim.—1. The process for the production of anthracene coloring-matters by treating with caustic alkali a hereinbefore-defined benzanthrone compound obtainable by condensing together an alpha-amidoanthraquinone body and glycerin.

2. The process for the production of anthracene coloring-matter by treating with caustic alkali a hereinbefore-defined benzanthrone compound obtainable by condensing together alpha-amidoanthraquinone and glycerin.

3. As new articles of manufacture, the anthracene coloring-matters which can be obtained by treating with caustic alkali a benzanthrone obtainable from an alpha-amidoanthraquinone body, which coloring-matters dissolve in concentrated sulfuric acid yielding olive-green solutions, and which dissolve in alkaline hydrosulfite yielding blue to violet vats which dye vegetable fiber substantively giving bluish shades.

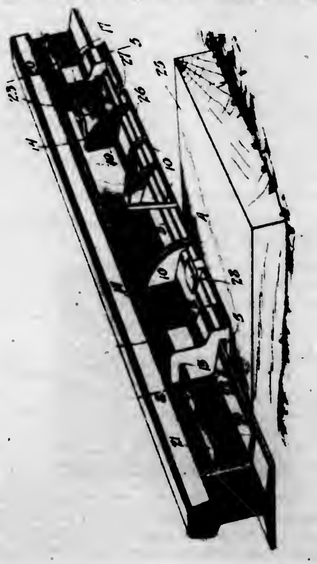
4. As a new article of manufacture the anthracene coloring-matter which can be obtained by treating with caustic alkali the benzanthrone obtainable from alpha-amidoanthraquinone, which coloring-matter dissolves in concentrated sulfuric acid yielding an olive-green solution, and which dissolves in alkaline hydrosulfite yielding a blue-violet vat which dyes vegetable fiber substantively yielding blue shades.

811,472. **TORPEDO-SETTING DEVICE.** HARRY A. BEALS, McCook, Nebr. Filed July 25, 1905. Serial No. 271,219.



Claim.—In a device of the class described, a head including a holder having spaced side portions, bearing-lugs formed on said side portions and provided with lateral-opening slots designed to receive a torpedo-spring, said lugs having sockets arranged to communicate with the slots and for the reception of the spring when the torpedo is moved upward in the holder, a movable plunger carried by the head and adapted to bear upon a torpedo positioned in the holder, and means for compressing the plunger to bearing position.

811,473. **BOLTLESS JOINT CONNECTION.** JOHN E. BEAVER, Warwick, Ohio. Filed July 19, 1905. Serial No. 270,423.



Claim.—1. The combination with the meeting ends of railroad-rails, of a chair therefor including web-plates, means carried by one of said plates, to engage the rails, wedges to be inserted between the other of said plates and the rail-webs, keys carried by said wedges and designed to engage the chair, and means to lock said keys to the chair.

2. The combination with meeting ends of railroad-rails, of a chair therefor including a base-plate to underlie the flanges of the rail, flange-plates overlying said flanges, and web-plates projecting vertically from the flange-plates, one of said web-plates being spaced from the rail-webs, vertically-arranged walls formed at the ends of the chair, wedges adapted for insertion within the space between the web-plate and rail-web, and keys carried by said wedges and longitudinally movable through openings formed in the walls.

3. The combination with the meeting ends of railroad-rails, of a chair therefor including web-plates, means carried by one of said plates to engage the rails, wedges adapted to be inserted between the other of said plates and the rail-webs, keys formed with a plurality of openings carried by said wedges, the chair being formed with openings to receive the keys, and cotter-pins to engage said openings in the keys to prevent removal of the wedges.

4. The combination with the meeting ends of railroad-rails, of a chair therefor including a base-plate, a flange-plate and a web-plate rising from the base-plate on each of the opposite sides of the rails, the flange-plate and web-plate on one side of the rails contacting with said rails, the flange-plate and web-plate on the opposite sides of the rails being spaced therefrom, wedges adapted to be inserted in the space between the said web-plate and rails, and a plate projecting from the wedge to seat in the space between the flange-plate and rails.

5. The combination with the meeting ends of railroad-rails, of a chair therefor including web-plates arranged parallel with the rail-webs, pins projecting laterally from one of the web-plates to engage openings formed in the rail-webs, wedges to be inserted between the other of said web-plates and the rail-web, keys carried by said wedges, and pins to lock said keys with relation to the chair.

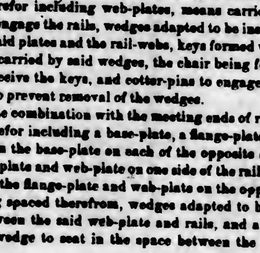
6. A rail-chair comprising a base-plate, flange-plates extending inwardly and spaced from said base-plate, web-plates extending vertically from the flange-plates, and wedges designed to coöperate with one of said web-plates, said wedges being movably supported by the chair, and means for locking said wedges with relation to said chair.

7. A rail-chair comprising a base-plate, flange-plates extending inwardly and spaced from said base-plate, web-plates extending vertically from the flange-plates, and wedges designed to coöperate with one of said web-plates, said wedges being movably supported by the chair, and means for adjustably locking said wedges with relation to said chair.

8. A rail-chair comprising a base-plate, flange-plates extending inwardly and spaced from said base-plate, web-plates extending vertically from the flange-plates, and wedges designed to coöperate with one of said web-plates, the chair being formed with longitudinally-arranged slots to receive and guide the wedges, and means for locking the wedges with relation to said shaft.

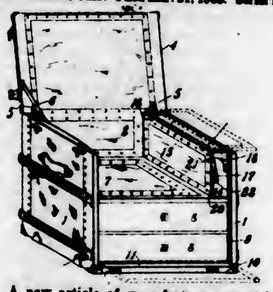
9. A rail-chair comprising a base-plate, flange-plates extending inwardly and spaced from said base-plate, web-plates extending vertically from the flange-plates, and wedges designed to coöperate with one of said web-plates, keys secured to said wedges and movably engaging the chair, and means for locking said wedges with relation to said chair.

811,474. MOLD. WILLIAM H. RENNOX, San Francisco, Cal. Filed Oct. 10, 1904. Serial No. 227,945.



Claim.—A mold for molding hooks, comprising a plurality of detachable sections having mold-cavities and also having coengaging dowel-pins and openings in their opposing sides, said sections being further provided with registering transverse bolt-openings, bolts in said openings securing said sections together, a bottom plate to cover one side of the mold, said bottom plate and said sections having coengaging dowel-pins and openings to secure them together, and former-plates on the upper side of the bottom plate and of the required size and shape to fit in the lower sides of the mold-cavities.

811,475. COMBINED DRESSER, CHAIR, AND TRUNK. FRANK L. BRADLEY, Cincinnati, Ohio. Filed Mar. 21, 1903. Serial No. 251,247.



Claim.—1. A new article of manufacture comprising a combined dresser chair and trunk consisting of a casing having a hinged lid adapted to be held in elevated position to form a back-rest, a removable front having grooves adapted to slide upon corresponding tongues in the vertical walls of the casing whereby said front is held in engagement with the casing, and said tongues.

2. A new article of manufacture comprising a combined dresser chair and trunk consisting of a casing having a hinged lid adapted to be held in elevated position to form a back-rest, a partition within said casing, a dresser above said partition, adapted when closed to form an arm-rest, a door having a mirror upon one side adapted to close said dresser, and a brace pivoted to said door and provided with notches adapted to engage a pin to hold said door at varying angles for the purposes specified, and said pin.

3. A new article of manufacture comprising a combined dresser chair and trunk consisting of a casing having a hinged lid adapted to be held in elevated position, a removable front, a partition within said casing to form a seat therein, a dresser having compartments within said casing above said partition, a door hinged to said dresser and adapted to swing upwardly, a notched brace secured to said door adapted to engage a pin to hold said door in adjusted position as set forth, and said pin.

4. A new article of manufacture comprising a combined dresser chair and trunk consisting of a casing having a hinged lid adapted to be held in elevated position, a removable front, a partition within said casing to form a seat therein, a dresser within said casing above said partition and provided with a hinged door adapted to close said dresser and to swing outwardly and to rest upon the upper edge of said casing to form a table as set forth.

811,476. BOWLING-ALLEY. FREDRICK W. BRINKERTER, Decatur, Ill. Filed Nov. 17, 1904. Serial No. 233,188.

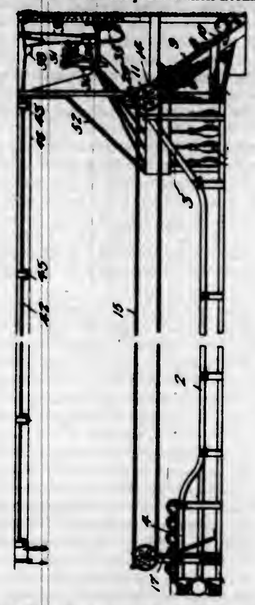
Claim.—1. In a bowling-alley, the combination of a set of pins, cords connected with the pins, weights connected with the cords, pivoted supports for supporting said weights in elevated position, detents engaging said supports, said detents being connected with the cords and adapted to be retracted thereby when the pins are struck by a ball to permit the supports and weights to drop and elevate the pins, and means for manually retracting any of the detents from the players' end of the alley.

2. In a bowling-alley, pins, operating-weights, cords connecting the pins with the weights, pivoted supports for the weights, latches holding said supports in supporting position, said latches being adapted to be retracted by said cords when the pins are struck by a ball, and means for restoring the weights and supports to their normal position and permit lowering and resetting of the pins.

3. In a bowling-alley, pins, operating-weights, pivoted supports for the weights, latches for holding the said supports in supporting position, connections between the pins, latches and weights, whereby when the pins are struck said latches will be retracted and permit the weights to fall and raise the pins, means for retracting the weights and pivoted supports, and means for manually operating the latches.

4. In a bowling-alley, the combination of a set of pins, weights

for elevating said pins, cords connecting the pins with the weights, a trap consisting of a series of sections adapted to support the weights in inoperative position, detents for supporting said trap-sections, said detents being operatively connected with said cords and retracted thereby when the connected pins are struck to retract the detents and permit the weights to drop, and means for lifting the weights and trap-sections in unison to restore the parts to their normal position.



5. In a bowling-alley, the combination of a set of pins, a set of weights for raising said pins, a trap composed of sections supporting said weights, detents engaging the trap-sections to hold them and the weights elevated, and means for retracting said detents when the pins are struck to allow the trap-sections and weights to drop and to cause said weights to elevate the struck pins.

6. In a bowling-alley, the combination of a set of pins, a set of weights for elevating the pins, a trap comprising a series of platform-sections for supporting said weights in elevated or inoperative position, detents engaging the platform-sections to hold them in position to support the weights, and operating connections between the pins, weights and detents whereby the detents will be retracted when the pins are struck by a ball to release the trap-sections and permit the weights to drop and elevate the pins.

7. In a bowling-alley, the combination of a set of pins, a trap comprising a series of swinging sections, pin-elevating weights supported by said sections, detents engaging the sections and holding them elevated, cords connecting the pins with the weights and operatively engaging the detents to retract the same when the pins are struck by a ball, means for manually retracting the latches, and means for returning the weights and platform-sections to their normal position.

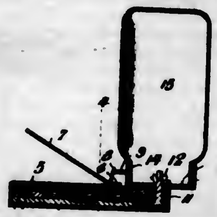
811,477. POWDER FOR DUSTING PATTERNS IN FOUNDRIES. RUDOLF BRÖSE, Berlin, Germany. Filed Sept. 29, 1904. Serial No. 226,592.

Claim.—The herein-described product consisting of a resinous substance incorporated with siliceous marl.

811,478. ENVELOP-MOISTENER. EDWARD S. BUCKLAND, Binghamton, N. Y., assignor of one-half to William J. Hastin, Binghamton, N. Y. Filed Nov. 1, 1904. Serial No. 230,570.

Claim.—1. The combination with a tray having absorbent material therein, of a hollow extension to the tray having an opening in its top; a holder upon the extension, a tubular outlet to the holder and projecting into the opening, a wick within the outlet and projecting through the extension into the tray, and a liquid-food upon the holder.

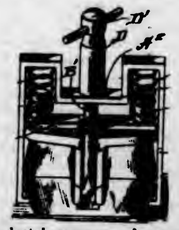
2. The combination with a tray having absorbent material therein, of a spring-supported cover above the tray and normally raised therefrom; of a receptacle, a tubular outlet therefrom projecting downward into the tray, and a wick within the outlet-tube extending into the tray.



3. The combination with a tray having an absorbent therein, of a spring-supported cover upon the tray, a tubular extension to the tray having an opening in the top thereof; a holder connected with the extension, a tubular outlet for the holder projecting into the extension, a wick extending through the outlet and extension into the tray, and a receptacle detachably secured within and opening into the holder.

4. The combination with a tray having absorbent material therein, of a hollow extension to the tray having an opening in its top, a holder connected with the extension and having a tubular outlet loosely seated in said opening, a wick arranged in the outlet and extending into the tray, a receptacle detachably connected with and opening into the holder, a closure hinged upon the tray and having an arm, and a spring connecting the arm with the holder.

811,479. DENTAL COMPRESS. NATHAN L. BURKE, Benton Harbor, Mich. Filed June 14, 1905. Serial No. 265,182.



Claim.—1. In a dental compress, a frame and a cross-bar slidingly mounted therein, tension-springs extending between said cross-bar and one end of said frame, a threaded bolt extending through the frame from the cross-bar, a handle provided with a nut to draw said bar through the frame and place said springs under compression, lugs extending from the opposite ends of said cross-bar, and adapted to travel in slots or ways in the side walls of the frame.

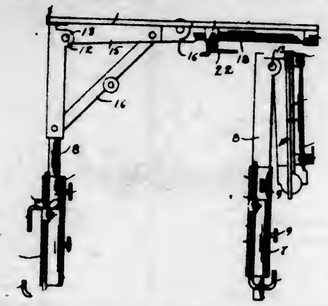
2. In a dental compress, a frame and a cross-bar slidingly mounted therein, tension-springs extending between said cross-bar and one end of said frame, a threaded bolt extending through the frame from the cross-bar, a handle provided with a nut to draw said bar through the frame and place said springs under compression, lugs extending from the opposite ends of said cross-bar, adapted to travel in slots or ways in the side walls of the frame, a depending U-shaped portion at the top of the frame through which said bolt passes, and posts disposed within the springs at the opposite sides of said depending portion.

811,480. PORTABLE TABLE. JAMES D. CANFIELD, Stillwell, Ky. Filed Mar. 6, 1905. Serial No. 248,979.

Claim.—1. In a portable table, the combination with a plate adapted to be secured to the sides of a bedstead or to a vertical surface, of a support adjustably mounted in said plate, a hinged arm carried by the upper end of said support, a sectional table carried by said arm, and means for adjustably securing the outer section of the table to the outer end of the hinged arm, whereby the same may be secured at any angle.

2. In a portable table, the combination of a supporting-plate provided with a centrally-arranged tube, means for securing the same to the side of a bed or a vertical surface, a cylindrical support mounted in said tube, a hinged arm hingedly secured to the upper

end of said support, an inner section of a table stationarily secured to the inner section of the hinged support, an outer section of a table adjustably secured to the outer section of the arm, means for holding the outer section at any angle with relation to the arm, and means for bracing the hinged arm in horizontal position connected to the arm and the support.



3. In a portable table, the combination of a supporting-plate provided with a centrally-arranged tube, means for securing the plate to the side of a bed or a vertical surface, a cylindrical support mounted in said tube, a hinged arm hingedly secured to the upper end of said support, an inner section of a table stationarily secured to the inner section of the hinged support, an outer section of a table adjustably secured to the outer section of the arm, means for holding the outer section at any angle with relation to the arm, and means for engaging the outer end of the arm for holding it in folded position.

4. In a portable table, the combination with a supporting-plate provided with a centrally-arranged tube, of a support adjustably mounted in said tube, a hinged sectional arm hingedly connected to the upper end of said support, and a sectional table carried by said hinged arm the outer section of the table being rotatably mounted upon the outer section of the arm for the purpose set forth.

5. In a portable table, the combination with a plate provided with a centrally-arranged tube, said plate being adapted to be secured to the sides of a bedstead or to a vertical surface, of a support adjustably mounted in said tube, a hinged sectional arm carried by the upper end of said support, and a sectional table carried by said arm the outer section of the table being rotatably mounted on the outer section of the arm, for the purpose set forth.

6. In a portable table, the combination with a supporting-plate provided with a centrally-arranged tube, of a support adjustably mounted in said tube, means carried by the support for limiting the downward movement thereof within the tube, means passing through the tube to engage the support to hold it at the proper adjustment, a hinged sectional arm carried by the upper end of said support, a sectional table carried by said arm, the outer section of said table being rotatably mounted upon said arm, and means for holding the rotatable section at its proper adjustment with relation to the arm.

7. In a portable table, the combination with a supporting means, of a standard adjustably supported by said supporting means and provided with a socket in its upper end, an arm hingedly connected to the upper end of said standard and provided in the socket upon the under side near the hinged portion, a table carried by said hinged arm, and a hinged brace connected to the standard and the arm and adapted when folded to be incased in the sockets of the standard and arm.

811,481. TYPE-WRITING MACHINE. GEORGE W. CAMPBELL, New York, N. Y. Filed Feb. 4, 1904. Serial No. 192,026.

Claim.—1. In a paper-feed device for type-writing machines, the combination with the platen, the platen-frame, the apron pivoted to said frame, the feed-roll carried by said apron, a pivot-bar mounted in said frame, the feed-roll brackets pivotally mounted on said bar and having upwardly-projecting fingers, the feed-roll carried by said brackets, the spring means connected to said brackets, of the release-bar mounted above said brackets and suitably bent to engage said aprons, and having projections thereon engaging the fingers on said brackets.

2. In a paper-feed device for type-writing machines, the combination with the platen and the platen-frame, of an apron surrounding the under side of said platen and having a suitable perforation therein and pivoted at one end to the said frame, the feed-roll mounted on said apron in position to rest normally on the upper face of the platen, a feed-roll bracket mounted independently of said apron, a feed-roll carried by said bracket in position to normally project through the said perforation in engagement with the under surface of the platen, and means for elevating the free end of said apron and for engaging the said bracket to move the feed-rolls away from the surface of the platen.

3. In a paper-feed device for type-writing machines, the combination with the platen and the platen-frame, of an apron pivoted near one end to the platen-frame at one side of the platen surrounding the under side of the platen and projecting upwardly and rearwardly at the other side of the platen, a feed-roll carried by the apron at the end adjacent its pivot and normally resting against the surface of the platen, and means independent of said apron for elevating the rear end thereof to turn the apron on its pivot to carry said feed-roll away from the surface of the platen.

4. In a paper-feed device for type-writing machines the combination with the platen and the platen-frame, of an apron surrounding the under side of the said platen pivoted near one end to the said frame and free at its opposite end, a feed-roll mounted on the end of the apron adjacent its pivot and resting normally against the surface of the platen, and means independent of said apron for elevating the free end thereof to turn the apron on its pivot to carry the feed-roll away from the surface of the platen.

5. In a paper-feed device for type-writing machines, the combination with the platen and the platen-frame, of an apron pivoted at one side of the platen surrounding the under side of the platen extending upwardly and to the rear of the platen and free at its rear end, a feed-roll mounted on the pivot end of the apron and resting normally against the surface of the platen, means independent of said apron for elevating the same to carry said feed-roll away from the surface of the platen, and a paper-feed roll normally in engagement with the platen and diametrically opposite to the feed-roll mounted on the apron.

6. In a paper-feed device for type-writing machines, the combination with the platen and the platen-frame, of an apron pivotally mounted near one end on said frame, and a paper-feed roll mounted on the end of said apron adjacent its pivot resting normally against the surface of the platen, and means independent of said apron for causing a pivotal movement of the apron to move said feed-roll away from the surface of the platen.

7. In a paper-feed device for type-writing machines, the combination with the platen and the platen-frame, of an apron pivotally mounted at one end and free at its other end, a feed-roll mounted on the pivot end of the apron and normally held against the surface of the platen by the weight of said apron, and means independent of said apron for elevating the apron to carry the feed-roll away from the surface of the platen.

8. In a paper-feed device for type-writing machines, the combination with the platen and the platen-frame, of an apron pivoted at one side of the platen surrounding the under side of the platen extending upwardly and rearwardly at the other side of the platen and free at its rear end, a feed-roll mounted on the pivot end of the apron and held normally against the surface of the platen by the weight of the said apron, and means independent of said apron for elevating the apron to carry the feed-roll away from the surface of the platen.

9. In a paper-feed device for type-writing machines, the combination with the platen and the platen-frame, of an apron having a feed-roll perforation pivoted at one side of the platen surrounding the under side of the platen extending upwardly and rearwardly at the other side of the platen and free at its rear end, a feed-roll mounted at the pivot end of the apron and held normally against the surface of the platen by the weight of the apron, a spring-pressed feed-roll projecting normally through the perforation in the apron and engaging the surface of the apron diametrically opposite to the feed-roll mounted on the apron, and means for elevating the apron and engaging the spring-pressed feed-roll to carry said rolls away from the surface of the platen.

10. In a writing-machine the combination with the platen and the platen-frame, of a guide-plate slidably mounted on said frame, a shank pivotally mounted on said guide-plate, a feed-roll mounted on said shank a spring in engagement with said shank and in slidable

engagement with said frame to hold the feed-roll in adjusted position and to hold the guide-plate against accidental displacement.

11. In a paper-feed device for type-writing machines, the combination with the platen and the platen-frame, of a guide-plate slidably mounted on said frame, a tubular housing mounted on said guide-plate, a feed-roll having a wedge-shaped shank pivotally mounted on said housing and movable into and out of engagement with the surface of the platen, and a spring mounted in said housing bearing against said shank and slidably engaging said frame to hold the guide-plate against automatic displacement of said frame and to hold the feed-roll in elevated position.

12. In a paper-feed device for type-writing machines, the combination with the platen and the platen-frame; of an apron pivotally mounted at one end and free at its other end, a feed-roll mounted on the pivot end of the apron and normally held against the surface of the platen by the weight of said apron, auxiliary means for holding said feed-roll against the surface of the platen, and means independent of said apron to elevate the apron to carry the feed-roll away from the surface of the platen.

811,482. FEEDING AND BLENDING MACHINE. CHARLES W. CARR, Jr., New Orleans, La. Filed June 1, 1905. Serial No. 263,302.

Claim.—1. An apparatus of the class described, comprising a plurality of hoppers, each having discharge-spouts, a receptacle into which said hoppers discharge, one or more of said hoppers including a conical bottom and a discharge-outlet, a pair of brace members having central bearings and secured within the hoppers, a hollow shaft held in the central bearings of said braces and projecting out through the top of the hopper, a gear-wheel on the projecting end of the hollow shaft, a plurality of agitating-arms adjustably secured to said hollow shaft between the braces, a collar detachably secured to said hollow shaft below the lower brace, diverging arms formed with said collar and projecting downwardly therefrom, a valve for closing the discharge-spout of the hopper, a valve-stem passing through said hollow rod and having its lower end threaded, said valve comprising a bell-shaped portion adapted to screw on the threaded end of said stem, a bottom disk on said stem and a nut on said stem for securing the bottom disk in position, said stem having its other end projecting beyond the outer end of the hollow shaft, and provided with a screw-thread, a turn-wheel having a threaded hub mounted on said stem beyond the outer end of the hollow shaft for adjusting the stem within the hollow shaft, and means for securing the valve-stem and the hollow shaft to rotate together.

2. In an apparatus of the class described, the combination with a receiving-box, a conveyer and mixing means therein, of a plurality of hoppers discharging into said box, each of said hoppers comprising a receptacle having a discharge-outlet, a valve within the receptacle for closing said discharge-outlet, a hollow rotatable shaft having arms mounted within the receptacle, means for operating said shaft and said conveyer, and means controlled from the outside of the receptacle and passing through said hollow shaft for operating said valve.

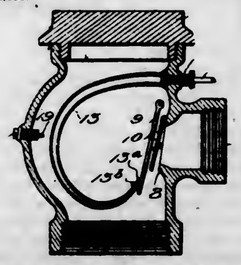
3. An apparatus of the class described comprising a plurality of hoppers each having discharge-spouts, a box into which said hoppers discharge, a screw conveyer in said box, mixing-spikes on the conveyer-shaft, means for driving said conveyer, said hoppers each having agitating devices within the same, each of said agitating devices comprising a hollow shaft, a plurality of arms adjustably mounted thereon, a worm-gear shaft having worm-gears for meshing with the worm-wheels of the agitating-shafts, means for coöperatively connecting said worm-gear shaft to said conveyer-shaft, a valve within each hopper for closing the discharge-spout thereof, means passing through the hollow shaft of each hopper and controlled from without the hopper for adjusting said valve.

4. An apparatus of the class described comprising a plurality of hoppers, each having discharge-spouts, a box into which said hoppers discharge, a screw conveyer in said box, mixing-spikes on the conveyer-shaft, means for driving said conveyer, said hoppers each having agitating devices within the same, each of said agitating devices comprising a hollow shaft, a plurality of arms adjustably mounted thereon, a worm-wheel on the end of said shaft without the hoppers, a worm-gear shaft having worm-gears for meshing with the worm-wheels of the agitating-shafts, means for coöperatively connecting said worm-gear shaft to said conveyer-shaft, a valve within each hopper for closing the discharge-spout thereof, means passing through the hollow shaft of each hopper and controlled from without the hopper for adjusting said valve, and means for connecting said last-named means and said hollow shaft to rotate together.

5. In an apparatus of the character described, the combination with a mixing-box, a conveyer therein, and means for driving said conveyer, of a plurality of hoppers having discharge-spouts discharging into said box, each of said hoppers comprising a body portion, a conical bottom having a discharge-aperture connected to the discharge-spout of the hopper, a sliding gate for the discharge-spout of the hopper, a pair of brace members having central bearings and secured within the hoppers, a cover for said hoppers, a hollow shaft held in the central bearings of said braces and projecting out through the top of the hopper, a gear-wheel on said projecting end of the hollow shaft, a plurality of agitating-arms adjustably secured to said hollow shaft between the braces, a collar detachably secured to said hollow shaft below the lower brace, diverging arms formed with said collar and projecting downwardly therefrom, a valve for closing the discharge-spout of the hopper, a valve-stem passing through said hollow rod and having its lower end threaded, said valve comprising a bell-shaped portion adapted to screw on the threaded end of said stem, a bottom disk on said stem and a nut on said stem for securing said bottom disk in position, said stem having its other end projecting beyond the outer end of the hollow shaft and provided with a screw-thread, a turn-wheel having a threaded hub mounted on said stem beyond the outer end of the hollow shaft for adjusting the stem within the hollow shaft, and means for securing the valve-stem and the hollow shaft to rotate together, substantially as shown and described.

6. In an apparatus of the character described, the combination with a mixing-box, a conveyer therein, and means for driving said conveyer, of a plurality of hoppers having discharge-spouts discharging into said box, each of said hoppers comprising a body portion, a conical bottom having a discharge-aperture connected to the discharge-spout of the hopper, a sliding gate for the discharge-spout of the hopper, a pair of brace members having central bearings and secured within the hoppers, a cover for said hopper, a hollow shaft held in the central bearings of said braces and projecting out through the top of the hopper, a gear-wheel on said projecting end of the hollow shaft, a plurality of agitating-arms adjustably secured to said hollow shaft between the braces, a collar detachably secured to said hollow shaft below the lower brace, diverging arms formed with said collar and projecting downwardly therefrom, a valve for closing the discharge-spout of the hoppers, a valve-stem passing through said hollow rod and having its lower end threaded, said valve comprising a bell-shaped portion adapted to screw on the threaded end of said stem, a bottom disk on said stem and a nut on said stem for securing said bottom disk in position, said stem having its other end projecting beyond the outer end of the hollow shaft and provided with a screw-thread, a turn-wheel having a threaded hub mounted on said stem beyond the outer end of the hollow shaft for adjusting the stem within the hollow shaft, and means for securing the valve-stem and the hollow shaft to rotate together, said last-named means comprising a pin or key secured to the valve-stem and projecting through a slot in the hollow shaft, and means for imparting motion to the gear secured to the hollow shaft to rotate the same substantially as shown and described.

811,483. HEAT-CONTROLLING APPARATUS. GEORGE CLEMENTS and JAMES M. HOOTLER, Chicago, Ill. Filed Apr. 22, 1904. Serial No. 204,638.



Claim.—1. A valve-casing, an arm within and pivoted to the casing adjacent to the valve-seat, said arm carrying intermediate its

ends a valve, a hollow member connected at one end to the valve-casing and at its other end loosely connected to the free end of the arm, said member adapted under variations of internal pressure to operate the arm, and thus the valve.

2. A valve-casing, an arm within and pivoted to the casing adjacent to the valve-seat, said arm carrying intermediate its ends a valve, a hollow member connected at one end to the valve-casing and at its other end loosely connected to the free end of the arm, said member adapted to expand under internal pressure to close the valve, and contract of its own inherent nature to open the valve when said pressure is removed.

811,484. **BROODER.** PAUL COATS, Lagrange, Ill. Filed May 6, 1905. Serial No. 259,175.

Claim.—1. A brooder comprising a base and a vertical adjustable hover-board, and an adjustable inclosing curtain.

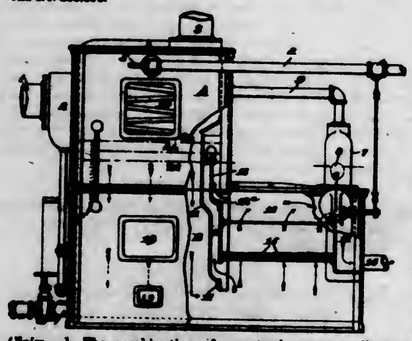
2. A brooder comprising a base, a fleece-lined hover-board vertically adjustable with relation to the base, and an inclosing curtain vertically adjustable with relation to the hover-board.

3. A brooder comprising a base, a perforate guard-cylinder projecting from the base, a hover-board having a depending cylindrical flange to embrace said guard-cylinder, and an inclosing curtain vertically adjustable with relation to said hover-board.

4. A brooder comprising a base provided with a vertically-projecting perforate guard-cylinder, a hover-board slidably connected to said guard-cylinder, a vertically-arranged flange secured to the periphery of the hover-board, a curtain-ring frictionally and slidably engaging said flange, and a curtain depending from said ring.

5. A brooder comprising a base provided with a vertically-projecting perforate guard-cylinder, a fleece-lined hover-board slidably connected to said guard-cylinder, a vertically-arranged flange secured to the periphery of the hover-board, a curtain-ring vertically and slidably engaging said flange, and a curtain depending from said ring.

811,485. **MEANS FOR PURIFYING AND REGULATING WATER.** DAVID COCHRANE, Philadelphia, Pa. Filed May 16, 1905. Serial No. 260,896.



Claim.—1. The combination of a water-heater, a collecting-tank communicating therewith; a filter in said tank; an outflow-chamber, and a conduit within the tank, open at the bottom and extending from the lower portion of the tank to above the normal water-line; a partition in said conduit extending from near its top and forming a passage communicating with the outflow-chamber.

2. The combination of a water-heater, a collecting-tank communicating therewith; a filter in said tank forming an outflow-chamber; a conduit within said tank leading from above the normal water-line therein to the outflow-chamber, and an inclosing conduit open at the bottom and extending from the lower portion of the tank over the first-mentioned conduit communicating therewith and inclosing the same.

3. The combination of a water-heater, a collecting-tank communicating therewith; a filter in said tank, and an inclosed passage in the tank, leading from the lower part of the same to the outflow, and vented at the top.

4. The combination of a tank; a filter therein; an outflow-chamber beyond the filter, and an open passage vented at the top, connecting the lower portion of the tank with the outflow-chamber.

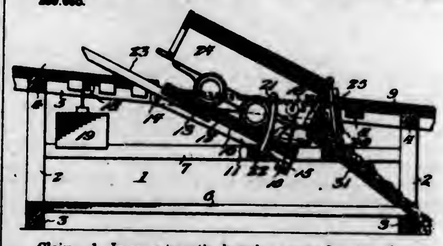
5. The combination of a tank; a filter therein, and an open passage within the tank vented at the top and connecting the lower portion of the tank with the outflow.

6. The combination of a tank; a filter therein, and an interior integral conduit vented at the top connecting the lower portion of the tank with the outflow.

7. The combination of a tank; a horizontal filter therein; an outflow-chamber beyond the filter, and a passage from the tank below the filter up to, and vented at the water-line, and communicating with the outflow-chamber.

8. The combination of a tank, a horizontal filter therein, and a passage in the tank between the lower part of the tank below the filter and the outflow, said passage extending to the normal water-line and vented thereat.

811,486. **TIPPLE.** CHARLES R. COMBOS, Rusley, Ala., assignor of one-half to William D. Caldwell, Rusley, Ala., and one-fourth to John W. Wilkes, Jefferson county, Ala. Filed Jan. 4, 1905. Serial No. 239,695.



Claim.—1. In an automatic dumping means for cars, the combination of an inclined runway having two portions, a tilting tipple having openings and arranged between said portions and adapted to be tilted by the weight of a car running thereon, stationary stop devices below the tipple adapted to project through said openings and engage the car-wheels when the tipple descends, and means for restoring the tipple and dumped car to normal position and permit the same to run from the tipple to the dumping-point.

2. In a dumping apparatus for cars, the combination of an inclined runway having two portions, a tilting tipple arranged between said portions and adapted to descend under the weight of the car passing thereon from the upper portion of the runway, stationary wheel-engaging devices brought into action by the downward movement of the tipple to hold the car from downward movement thereon, automatic means for discharging the load upon the descent of the tipple, and means for automatically restoring the tipple and car to normal position after the load is dumped, the upward movement of the tipple disengaging the wheels from said wheel-engaging devices, thus permitting the car to pass from the tipple to the lower portion of the runway.

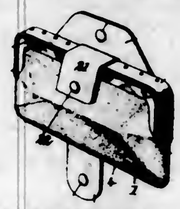
3. In an automatic car-dumping apparatus, a tilting tipple carrying a stop projected rearwardly therefrom when the tipple is dumped to prevent a car from passing onto the tipple when the latter is loaded.

4. In an automatic dumping apparatus for cars, a frame having track-rails, a tilting tipple, a stop adapted to project upward through the tipple when the latter descends to arrest the movement of a car thereon, and stops carried by the tipple and projectable above the rails to arrest a following car.

5. In an automatic dumping apparatus for cars, the combination of an inclined runway, a tilting tipple, stops limiting the upward movement of the tipple, and a counterweight connting with said stops to return the tipple to normal position.

811,487. **WATERPROOF EYEGLASS-CASE.** MEDIAH DAVISON, New York, N. Y. Filed Mar. 7, 1905. Serial No. 249,827.

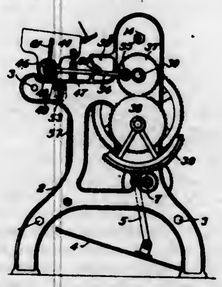
Claim.—1. An eyeglass-case having a pair of jaws, said jaws having parallel opposite bodies adapted to be brought together, with side extensions extending downwardly and hinged together, one of said jaws having a groove extending longitudinally of its body and longitudinally of the side extensions thereof, the opposite jaw having a tongue extending longitudinally of the body thereof and longitudinally of the side extensions thereof, said tongue being received in said groove and forming a water-tight joint between said jaws.



2. An eyeglass-case having a pair of jaws, said jaws having parallel opposite bodies adapted to be brought together, with side extensions extending downwardly and hinged together, one of said jaws having a groove extending longitudinally of its body and longitudinally of the side extensions thereof, the opposite jaw having a tongue extending longitudinally of the body thereof and longitudinally of the side extensions thereof, said tongue being received in said groove and forming a water-tight joint between said jaws, one of said jaws further having a lip projecting beyond the edge of the opposite jaw and cooperating with said tongue and groove to form a water-tight joint in said jaws.

3. An eyeglass-case having a body, the upper portion whereof is formed into a jaw, said jaw having a body with side extensions, a second jaw adapted to close upon said first jaw and having a body with side extensions hinged to said first side extensions, the adjacent faces of said jaws having, the one a groove and the other a tongue adapted to be received within said groove, and a flap disposed across said jaws and adapted to secure the same together.

811,488. **PRINTING-PRESS.** THOMAS B. DOOLEY, Malden, Mass., assignor to Joseph Middleby, Jr., Malden, Mass. Filed Apr. 10, 1905. Serial No. 255,974.



Claim.—1. In a printing-press, the combination of a platen-carrier, parallel guides therefor, extending at right angles to its working face, pivots coöperating with said guides and providing stops to limit the rearward movement of the carrier, and means for reciprocating said carrier on its guides and turning it in an arc of a circle having said pivots as a fixed central axis.

2. In a printing-press, the combination of a platen-carrier, parallel guides therefor, extending at right angles to its working face, pivots coöperating with said guides and providing stops to limit the rearward movement of the carrier, springs interposed between the pivots and the ends of the corresponding guides for cushioning the carrier, and means for reciprocating said carrier on its guides and turning it on said pivots as a central axis.

3. In a printing-press, the combination of a platen-carrier having slotted arms forming guides, relatively fixed pivotal devices arranged to slide in the slots of said arms respectively and providing stops to limit the rearward movement of the carrier, supplementary guides for said carrier arranged to operate in parallelism with said slots, and means for reciprocating said carrier on the latter guides and for turning it in an arc of a circle having said pivotal devices as a central axis.

4. In a printing-press, the combination of a platen-carrier and guides on which said carrier is adapted to slide at right angles to its working face, arms secured to said carrier and provided respectively with slots, blocks mounted to slide in said slots and journaled on fixed pivots respectively, said blocks forming stops to limit the rearward sliding movement of the carrier, and means for reciprocating said carrier on said guides and for turning it on said pivots as a central axis.

5. In a printing-press, the combination of a platen-carrier and guides on which said carrier is adapted to slide at right angles to its working face, arms secured to said carrier and provided respectively with slots, blocks mounted to slide in said slots and journaled on fixed pivots respectively, said blocks forming stops to limit the rearward sliding movement of the carrier, a spring interposed between each block and the forward end of the corresponding slot, and means for reciprocating the carrier and for turning it on said pivots as a central axis.

6. In a printing-press, the combination with a type-bed having forwardly-turned edges, of a platen-carrier movable toward and from the type-bed and having edges adapted to abut against the edges of the type-bed when in the impression position, a platen carried by said carrier and means for adjusting said platen.

7. In a printing-press, the combination with a type-bed having forwardly-turned edges, of a platen-carrier movable toward and from the type-bed and having edges adapted to abut against the edges of the type-bed when in the impression position, a platen carried by said carrier, a rod or shaft journaled in said carrier and provided at its ends with eccentrically-mounted pins, and means connected to said pins for reciprocating said carrier.

8. In a printing-press, the combination with a type-bed having forwardly-turned edges, of a platen-carrier movable toward and from the bed and having edges adapted to abut against the edges of the type-bed when in the impression position, a platen carried by said carrier, a rod or shaft journaled in said carrier and provided at its ends with eccentrically-mounted pins, means connected to said pins for reciprocating said carrier, and a throw-off lever connected to one of said pins.

9. In a printing-press, the combination of a platen-carrier, a rod journaled therein, means connected eccentrically to said rod for operating the carrier, an arm rigidly connected to said rod and having an operating-handle pivoted thereto, said handle being provided with a locking-finger, and a ring adjustably mounted on said carrier and provided with a notch adapted to receive said locking-finger.

10. In a printing-press, the combination of a platen-carrier, a rod journaled therein and provided at its ends with eccentrically-mounted pins, means connected to said pins for reciprocating said carrier, a ring adjustably mounted on said carrier and provided with a notch, and a lever connected to the said rod and provided with a locking-finger adapted to engage said notch.

11. In a printing-press, the combination of a platen-carrier and guides therefor, said guides permitting a sliding movement of the carrier toward and from the type-bed, pivots coöperating with said guides and providing stops to limit the rearward movement of the carrier, and means for reciprocating said carrier on its guides and turning it on said pivots as a central axis, said means comprising a pair of intermittent self-locking gears, means for driving one of them, and crank-rods connecting the driven gear with the platen-carrier.

12. In a printing-press, the combination with a platen-carrier and guides therefor, of pivots coöperating with said guides and providing for a turning movement of said carrier, springs 52 interposed between said pivots and one end of the guides, and means for operating the carrier.

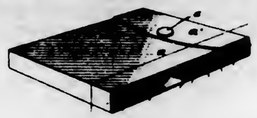
13. In a printing-press, the combination of a platen-carrier mounted to slide toward and from the type-bed and to turn on pivots at a distance from said type-bed, means for operating said carrier, and springs 57 for supporting the latter, substantially as described.

14. In a printing-press, the combination with a platen-carrier mounted to slide toward and from the type-bed and to turn face upward at a distance from said type-bed, of means for operating said carrier comprising intermittent self-locking gears and crank-rods connecting the driven gear with the carrier.

811,489. **CARD-CASE.** WILLIAM C. DUNWELL, Chicago, Ill. Filed Oct. 2, 1905. Serial No. 281,013.

Claim.—1. In combination with a casing or cover, of a metallic card-frame consisting of a base-plate having a box-like device at its upper end, this device embodying side flanges and a transverse flange, a broad, flat, spring-actuated clamp-plate attached to the lower end of the base-plate, and extending in under said flanges and normally bearing up against the under side of the same, and means for attaching the card-frame to the case or cover.

2. In combination with a flexible case or cover provided with a pocket across its lower end and another pocket at its upper end, of a card-frame comprising a base-plate having a tongue b^4 at its upper end adapted to enter said pocket at the upper end of the case, the lower end of the base-plate being adapted to enter the other pocket carried by the case, and card-holding means carried by the base-plate.



811,490. PNEUMATIC TIRE. JAMES M. ELDER, Indianapolis, Ind. Filed Mar. 24, 1905. Serial No. 251,366.

Claim.—1. The combination with a wheel-rim, of a pneumatic tire, side pieces adapted to extend around the sides of said tire and to conform thereto, said side pieces having flanges adapted to engage the sides of said wheel-rim and portions adapted to extend between said rim and tire, a bearing-strip arranged between said side pieces over the tread of the tire, means to secure said bearing-strip in place, means to secure said side pieces to the wheel-rim, and means to clamp said side pieces to each other between the tire and the rim.

2. The combination with a wheel-rim, of a metal tire thereon, a pneumatic tire, side pieces adapted to extend round the sides of said pneumatic tire and to conform thereto, said side pieces having flanges adapted to engage the sides of said wheel-rim and portions adapted to extend between said rim and tire, a bearing-strip arranged between said side pieces over the tread of the pneumatic tire, means to secure said bearing-strip in place, means to secure said side pieces to the wheel-rim, and means to clamp said side pieces to each other between the pneumatic tire and the metal tire.

811,491. FLOOR STRUCTURE. JEAN ERATH, Strassburg, Germany. Filed Feb. 9, 1903. Serial No. 142,639.

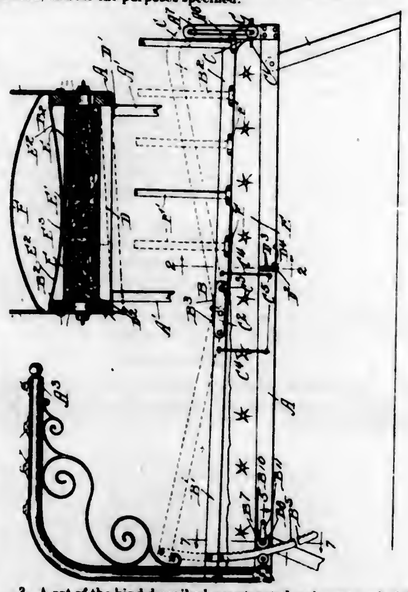
Claim.—1. A floor or ceiling composed of flanged members, rods supported on the flanges of said members and from each other, T-irons suspended from said rods, and flags supported from said T-irons.

2. A floor or ceiling comprising flanged members, cranked rods supported on the flanges of said members and from each other, T-irons suspended from said cranked rods, and flags supported by said T-irons, all substantially as and for the purpose specified.

811,492. COT FOR INVALIDS. MILTON Q. FAIR, Sr., Chicago, Ill. Filed Apr. 17, 1905. Serial No. 256,048.

Claim.—1. A cot of the kind described, composed of the several parts forming the combination consisting of a main body A having supports A'; a movable transverse frame D secured to said main body; a pair of brackets A^4 affixed to said main frame, having movable cross-bars; a pair of slotted arms A^7 affixed to said main frame; a shaft B^6 supported transversely in said main body; a pair of gear-wheels and a ratchet-wheel affixed on said shaft; a pawl pivotally attached to said main frame adapted to engage said ratchet-wheel; a pair of grooved wheels supported on said main body; a frame B formed of two parts hinged together; a pair of racks pivotally attached to the frame B and supported by said gears and grooved wheels; a pair of pivot-studs and thumb-screws, said studs being affixed in the frame B and adjustable in the arms A'; a pair of locking plates and pins adapted to lock the two parts of the frame B; a canvas secured to the frame B, having a central aperture; and a mattress having a removable part E'; substantially as described and for the purposes specified.

2. A cot of the kind described, constructed and composed of the several parts and mechanism, forming the combination consisting of a main body, A, having suitable supports; and a drop-frame, D; a pair of brackets, A^4, affixed to the head of said main body; a pair of vertical arms, A^7, affixed to the foot of said main body; a shaft, B^6, supported transversely in the head of said body; a pair of gear-wheels and a ratchet affixed on said shaft, and means for operating said gear-wheels, a frame, B, formed of two parts, B' and B^2, pivotally connected and adapted to be folded together; means for locking said parts in the open position and thereby making the two parts, B' and B^2, one rigid frame, B; a pair of racks, B^3, secured to the head of the part, B', said racks being adapted to be engaged, supported and operated by the gear-wheels, B^7; means for adjustably connecting the end of the part, B^2, to the vertical arms, A^7; a canvas attached to the frame, B, extending from end to end and side to side thereof and having a central aperture; a mattress, E, supported on the main body, A, said mattress having a removable part, E'; substantially as described, and for the purposes specified.



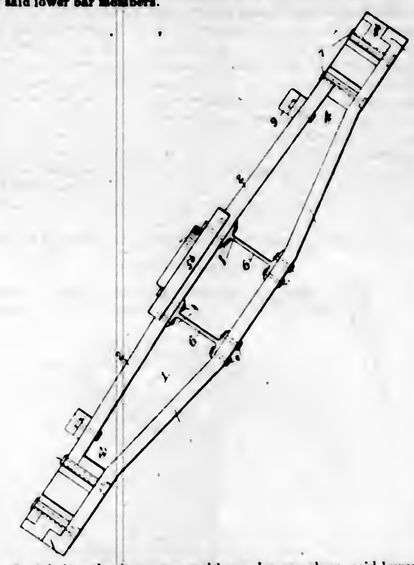
3. A cot of the kind described, constructed and composed of the several parts and mechanism forming the combination, consisting of a main body, A, and drop-frame, D; a frame B, formed of two parts, B' and B^2, pivotally connected; means for supporting said frame on said main body; suitable mechanism for raising and lowering said frame above said main body and for moving each of the parts, B' or B^2, independently of the other; a canvas, E^3, supported by said frame, B, said canvas having an aperture, E^2; a mattress, E, supported on said main body, said mattress having a removable part, E', and means for supporting said part in said mattress; substantially as described, and for the purposes specified.

4. In a cot of the kind described, the combination of a main body, A, having a drop-frame, D, and a mattress, E, said mattress having a removable part, E', supported by said main body and said frame, D, with a frame, B, formed of two parts hinged together near the center of the length of said frame, said frame being provided with a canvas, E^3, stretched from side to side and end to end of said frame and secured thereto, said canvas having a central aperture, E^2, corresponding in position to the removable part, E', of the mattress, E; mechanism for supporting said frame on said main body and for adjusting said frame above said mattress; substantially as described, and for the purposes specified.

811,493. CAR-TRUCK BOLSTER. THOMAS FOWLER, Beaumont, Tex. Filed Aug. 31, 1905. Serial No. 276,082.

Claim.—1. A bolster having its lower members provided with upward-extended end portions taken into bottom corner-recesses in the end members.

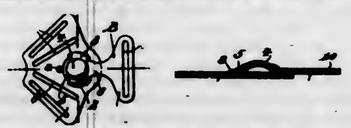
2. A bolster having lower and upper bar members and end members with their outer end walls provided in the upper edges thereof with recesses effective to receive and support therein the end portions of said upper bar members, said end members having in their lower corner edges recesses adapted to receive the end portions of said lower bar members.



3. A bolster having upper and lower bar members, said lower bar members having upward-extended end lugs or projections, and end members having recesses in the upper edges of their outer end walls to receive the ends of said upper bar members, said end members also having recesses in their outer and lower corners effective to receive said upward-extended end lugs or projections.

4. A bolster, comprising upper and lower bar members, end members, a central cap or plate member having lateral downward-extended flanges and pendent ribs upon their under sides, between which ribs and flanges are received said upper bar members, and I-beam members arranged upon opposite sides of a line passing centrally through said upper and lower bar members, said end members having recesses in the upper edges of their outer end walls to receive and support the outer end portions of said upper bar members, and additional recesses in their lower outer corner edges to receive upward-extended projections of said lower bar members.

811,494. FASTENING DEVICE. FRANK A. FREEMAN, Philadelphia, Pa. Original application filed Apr. 1, 1904, Serial No. 201,063. Divided and this application filed Feb. 9, 1905. Serial No. 244,861.

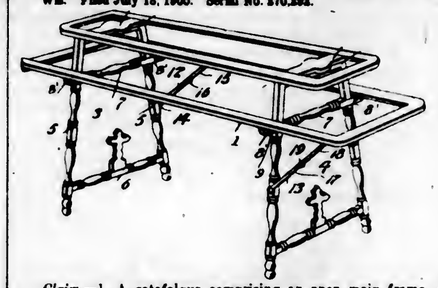


Claim.—1. In a fastening device, the combination of two interlocking members, one member having a flattened circular concavo-convex head, the other member provided with oppositely-disposed arc-shaped lips, the one symmetrical with the other, for engaging said head therebetween, and a projection on the flat surface of the lip member approximately between the receiving ends of the lips and outside the margin of the head when in final position, said projection so located as to lie within the concave portion of the head until the same has been brought into preliminary engagement with the lips.

2. In a fastening device, the combination of two interlocking members, one member having a flattened circular concavo-convex head; the other member provided with oppositely-disposed convergent arc-shaped lips, the one symmetrical with the other, for engaging said head therebetween, and a projection on the flat surface of the lip member approximately between the receiving ends of the lips and outside the margin of the head when in final position, said projection so located as to lie within the concave portion of the head until the same has been brought into preliminary engagement with the lips.

3. In a fastening device, the combination of two interlocking members, one member having a flattened circular concavo-convex head, the other member provided with oppositely-disposed arc-shaped lips, the one symmetrical with the other, for engaging said head therebetween, a resiliently-mounted projection on the flat surface of the lip member approximately between the receiving ends of the lips and outside the margin of the head when in final position, said projection so located as to lie within the concave portion of the head until the same has been brought into preliminary engagement with the lips.

811,495. CATAFALQUE. WLADYSLAW J. GABRYSEK, Greenbay, Wis. Filed July 18, 1905. Serial No. 270,282.



Claim.—1. A catafalque comprising an open main frame, a supporting-frame adapted to fold within the main frame, and stands pivotally connected to said main frame to hold the supporting-frame above the main frame when the device is set up, and to fold substantially parallel with said main frame to collapse the device and fold the supporting-frame within the main frame.

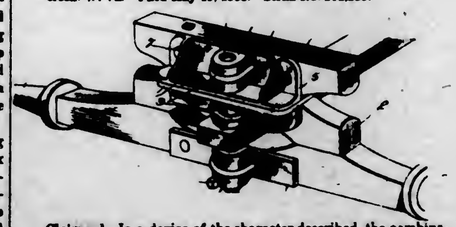
2. A catafalque comprising a main frame, a casket-supporting frame, and stands pivotally connected at their upper ends to the supporting-frame and below the same to the main frame and adapted to be swung parallel with the main frame to fold the supporting-frame down upon the same.

3. A catafalque comprising a pair of end stands, a main frame hinged to said stands below the upper ends thereof, a casket-supporting frame hinged to the upper ends of the stands, and hinged braces connecting the stands with the main frame, the construction being such that the stands are adapted when set up to hold the supporting-frame above the main frame and to be swung parallel with the main frame to fold the supporting-frame down upon the same.

4. A catafalque comprising end stands composed of connected pairs of legs, a main frame hinged to the stands outside of and below the upper ends of the legs, a casket-supporting frame hinged to the upper ends of the legs, and folding braces connecting the stands with the main frame.

5. A catafalque comprising a main frame, a pair of end stands, each composed of a pair of legs connected at their lower ends and at a point below their upper ends by rounds and at their upper ends by a cross-bar, the upper round being provided with extensions beyond the legs and to which the main frame is hingedly connected, a casket-supporting frame adapted to fold within the main frame and hinged to the cross-bars of the end stands, and braces adapted to fold with the stands and pivotally connecting the same with the main frame.

811,496. KING-BOLT COUPLING. WILLIAM W. GREEN, Newcreek, W. Va. Filed May 19, 1905. Serial No. 261,230.



Claim.—1. In a device of the character described, the combination of a bolster-plate a portion of which extends beyond the side of

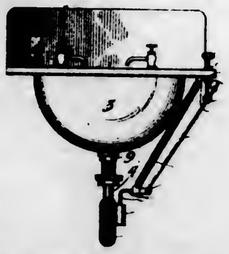
the bolster, a flange attached thereto and embracing a side of the bolster, a reinforcing-web between the flange and the projecting portion of the bolster-plate, and a socket attached to the bolster-plate for the reception of the king-bolt.

3. In a device of the character described the combination of a bolster-plate a portion of which extends beyond a side of the bolster, a flange attached to the said bolster-plate and embracing a side of the bolster, a reinforcing-web between the flange and the projecting portion of the bolster-plate, a socket attached to the flange and the projecting portion of the bolster-plate, and a reinforcing-clamp for said socket the arms of which pass through openings in the flange on each side of the socket and are secured to the bolster.

3. In a device of the character described, the combination of a bolster-plate a portion of which extends beyond a side of the bolster, a flange attached to the said bolster-plate and embracing a side of the bolster, and a socket attached to the flange and the projecting portion of the bolster-plate.

4. In a device of the character described, the combination of vertically-alined sockets in the bolster and head-block, a king-bolt passing through the sockets and removable from below, a removable plug fitting in the lower socket and adapted to serve as a support for the king-bolt, and means for holding the plug in position.

811,497. VALVE. GUSTAVE HARDCASTLE, Berkeley, Cal. Filed June 21, 1905. Serial No. 266,202.



Claim.—1. The combination with a basin or other receptacle, of a sleeve formed with a valve-seat and secured in the basin-outlet, said sleeve being in open communication with the water-escape pipe, a valve for said seat, a valve-rod depending from said valve and projecting laterally beyond the water-escape pipe, a rod pivotally connected to the free end of said valve-rod, means for operating said rod to depress the valve-rod, and a spring for returning the valve-rod to normal position.

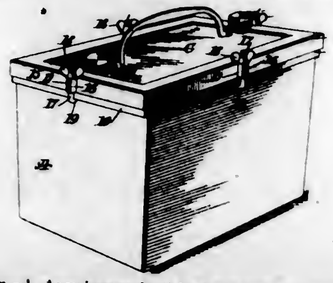
2. A valve mechanism for basins or the like comprising a sleeve, upper and lower lock-nuts for said sleeve, the upper lock-nut being formed with a valve-seat a valve for said seat, an outlet-pipe connected with the sleeve and provided with an elongated opening, a valve-rod depending from the valve and extending laterally through the opening in the outlet-pipe, and means arranged externally of said pipe for operating the valve-rod in both directions.

3. A valve mechanism for basins or the like comprising a sleeve to fit within the outlet-opening in the basin, upper and lower lock-nuts to secure said sleeve with relation to the basin, the upper lock-nut being formed with a valve-seat, a coupling member depending from the sleeve, an outlet-pipe removably connected with the coupling member and formed with an elongated opening, a housing secured to the outlet-pipe to conceal said opening, a valve to cooperate with said seat, a valve-rod depending from said valve, projected laterally through the opening in the outlet-pipe and upwardly through the top of the housing, a rod connected to the free end of the valve-rod, operating means connected to said rod, and a spring connected to said operating means and to the valve-rod.

4. The combination with a basin or the like, of a sleeve designed to fit within the outlet-opening of the basin, an upper lock-nut to engage said sleeve and overlie the surface of the basin, said nut being provided with an inwardly-projecting flange to form a valve-seat, a coupling member depending from said sleeve, a lock-nut having threaded engagement with said coupling member and adapted to bear against the lower surface of the basin, an outlet-pipe connected to the lower end of the coupling member and formed with an elongated opening, a housing secured to said outlet-pipe to conceal said opening, a valve for said seat, a valve-rod depending from the valve, projected laterally through the opening in the outlet-pipe and upwardly through the housing, a sleeve secured in the basin-board, a push-rod longitudinally movable within said sleeve, a rod connecting said push-rod and the valve-rod, and a spring connecting the valve-rod and the sleeve.

5. The combination with a basin or the like, of a sleeve designed to fit within the outlet-opening of the basin, an upper lock-nut to engage said sleeve and overlie the surface of the basin, said nut being provided with an inwardly-projecting flange to form a valve-seat, a coupling member depending from said sleeve, a lock-nut having threaded engagement with said coupling member and adapted to bear against the lower surface of the basin, an outlet-pipe connected to the lower end of the coupling member and formed with an elongated opening, a housing secured to said outlet-pipe to conceal said opening, a valve for said seat, a valve-rod depending from the valve, projected laterally through the opening in the outlet-pipe and upwardly through the housing, a sleeve secured in the basin-board, a push-rod longitudinally movable within said sleeve, a rod connecting said push-rod and the valve-rod, and a spring connecting the valve-rod and the sleeve, and means to lock the push-rod in lowered position.

811,498. CARRIER FOR PHOTOGRAPHIC PLATES. EDWARD L. HALL, New York, N. Y. Filed Apr. 17, 1905. Serial No. 255,958.



Claim.—1. As an improved article of manufacture, a carrier for photographic plates, consisting of a box-like receptacle, a skeleton tray provided with guides for a number of plates, the said tray being independent of the said receptacle but removably contained therein, a cover for the receptacle, provided with a capped inlet and a capped outlet, and devices engaging the cover and the receptacle, holding the two connected in a liquid-tight manner.

2. A carrier for photographic plates, consisting of a receptacle open at the top but otherwise closed, a skeleton tray located within the said receptacle, a cover fitted to the top of the receptacle in a water-tight manner, clamps carried by the cover and engaging with the receptacle, the said cover being provided with an inlet and an outlet aperture, and removable covers for the said apertures.

3. In a carrier for photographic plates, a receptacle open at the top but otherwise closed and provided at its upper portion with an exterior marginal flange having an undercut groove in its lower edge, a skeleton tray located within the receptacle, a cover for the said receptacle, provided with a downwardly-extending marginal flange adapted for engagement with the body-flange, tubular offsets from the said cover-flange, clamps carried by said offsets, each clamp comprising a threaded shank passed through a bore of an offset and provided with a nut at its threaded end, and a hook-head the bill whereof is adapted to enter the groove in the body-flange, the said cover being provided with an inlet and an outlet aperture, a threaded collar around each aperture and caps adapted to be screwed upon said collars.

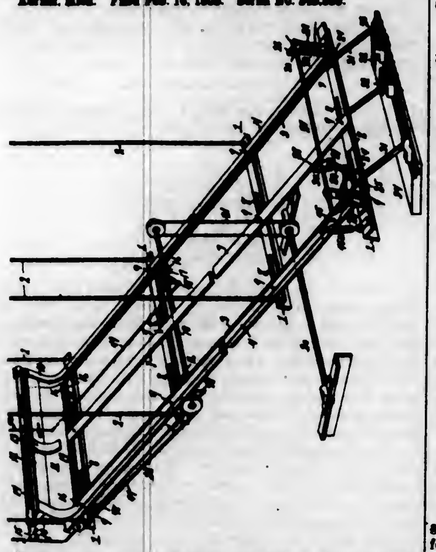
811,499. SHUTTLE HOLDER AND DRIVER FOR SEWING-MACHINES. PATRICK J. HASLEY, Elizabeth, N. J. Filed Feb. 22, 1905. Serial No. 246,573.

Claim.—1. A sewing-machine shuttle-holder comprising a driver, spring-pressed shuttle-holding devices on the driver, a bobbin-case removably placed in the shuttle, a finger on the bobbin-case, and a stationary part having a notch to receive said finger.

2. A sewing-machine shuttle-holder comprising a shuttle-driver, holding devices having pivotal connection with said driver and adapted for engaging with opposite sides of the shuttle, outwardly-extending finger-pieces on said holding devices, and a spring arranged between the finger-pieces.

3. A sewing-machine shuttle-holder comprising a shuttle-driver, spring-pressed holding devices mounted to swing on said driver and adapted for engaging with opposite sides of the shuttle, a bobbin-case removably placed in the shuttle, a retaining-ring depending from a slide-plate of the sewing-machine, the said ring being provided with a notch, a finger on the bobbin-case for engaging in said notch, and a spring-pressed latch on the retaining-ring for engaging with the bobbin-case.

811,500. MAGAZINE FOR FENCE-LOOMS. DENNIS H. HAYES, Adrian, Mich. Filed Feb. 16, 1905. Serial No. 245,830.



Claim.—1. A magazine-feed for wire-fabric machines, comprising a guide for receiving and directing the cross-wires, means for automatically placing the cross-wires in said guide, and means at the discharge end of the guide for feeding the cross-wires successively into the machine.

2. A magazine-feed for wire-fabric machines, comprising an inclined guide adapted to receive and direct the cross-wires, means for discharging the cross-wires into the upper end of said guide, reciprocatory feeding-gates at the lower end of said guide to discharge the cross-wires successively therefrom, and inclined tracks upon which said cross-wires are directed from the magazine to the fabric-machine.

3. A magazine-feed for wire-fabric machines, comprising a long inclined guide having ways for the ends of the cross-wires, means for directing the cross-wires into said ways, means for feeding the cross-wires down said ways, and means for discharging the cross-wires from said ways intermittently.

4. In a magazine-feed for wire-fabric machines, the combination of the inclined magazine having guides to direct the cross-wires, means for automatically discharging the wires into said guides, means for directing the wires from said guides into the machine, feeding devices for regulating the discharge of said wires from the guides, said feeding devices being actuated by a movable part of the machine to discharge the cross-wires intermittently.

5. In a magazine-feed for wire-fabric machines, the combination of a magazine consisting of a long inclined way adapted to receive the cross-wires and direct them to the fabric-machine, of feeding devices adapted to engage the opposite ends of the cross-wires to feed said wires down said way, and means at the discharge end of the magazine for feeding the wires intermittently into the machine.

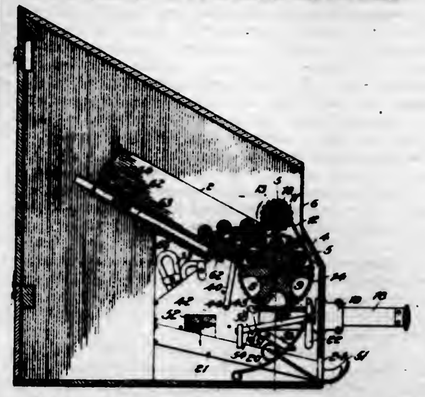
6. In a cross-wire-feed magazine, the combination of a way adapted to contain and direct the cross-wires, means for engaging the opposite ends of said wires to feed them along said way, and means for discharging the wires from the magazine into the machine.

7. A magazine for wire-fabric machines, comprising a long, inclined guideway, one side of said way being adjustable to accommodate various lengths of wires, means for feeding the wires along said way, and means for feeding the wires intermittently from said way into said fabric-machine.

8. A magazine-feed for wire-fabric machines, comprising a long, inclined way adapted to receive and direct the cross-wires, means for feeding the wires along said way, means for discharging the wires from the way into the machine, the wire-feeding means being movable into engagement with and away from said wires.

9. A magazine-feed for wire-fabric machines, comprising a long, inclined guideway, down which the wires are adapted to pass to the fabric-machine, means for discharging the wires from the magazine into said machine, means for forcibly feeding the wires along the magazine, and means for releasing the wires from said feed device to allow them to feed by gravity.

811,501. COIN-CONTROLLED VENDING-MACHINE. JOHN HENDRICK and JOHN SCHMIDT, Kansas City, and CARROLL L. STEPHENS, St. Louis, Mo. Filed Nov. 23, 1904. Serial No. 234,023.



Claim.—1. In a coin-actuated vending-machine, a revoluble goods-delivery cylinder, a plunger, a coin-controlled locking means for said plunger and independent coin-controlled locking means for said cylinder, both locking means released successively by the entrance of the coin into the slot and in its passage to its exit from said slot.

2. In a coin-actuated vending-machine, a revoluble goods-delivery cylinder, a plunger having a shoulder, means carried by said plunger for actuating said cylinder, means for locking said plunger consisting of a device of connected members including an upward-standing coin-receiving key and a depending bolt adapted to engage said shoulder to lock the plunger in its withdrawn position, and a pivoted tappet or trip located above the plunger in rear of the bolt and adapted to engage the bolt member and to be engaged by the plunger-shoulder for operation in the way stated, and means for supporting the depending bolt-locking member out of engagement with the plunger.

3. In a coin-actuated vending-machine, a revoluble goods-delivery cylinder, a plunger having a shoulder, means carried by said plunger for actuating said cylinder, means for locking said plunger consisting of a device of connected members including a coin-receiving key at the entrance-slot and a depending bolt adapted to engage said shoulder to lock the plunger in its withdrawn position, a pivoted tappet or trip located above the plunger in rear of the bolt and adapted to engage the bolt member and to be engaged by the plunger-shoulder, means whereby the bolt is maintained in its retracted position, and means for automatically releasing said bolt from its retracted position by the inward movement of the plunger.

4. In a coin-actuated machine, a rotating delivery-cylinder, a plunger having a shoulder, means carried by said plunger for actuating said cylinder to deliver cigars, means for locking said plunger consisting of a device of connected members including a coin-receiving key and a depending bolt adapted to engage said shoulder on

said plunger to lock it in its withdrawn position, a lug supporting the bolt in its retracted position and a weighted arm located above the plunger in rear of the bolt and caused to engage and release said bolt from its retracted position by the inward movement of said plunger.

5. In a coin-actuated vending-machine, the combination with a revoluble delivery-cylinder, and a plunger, of coin-controlled locking means for said plunger, consisting of pivotally-connected members the upper or key member of which projects through a guide-opening at the entrance of the coin-slot to partially close it against the entrance of the coin, a depending bolt member arranged to engage the plunger, and an intermediate member mediately pivoted to cause by the weight of the depending bolt member pivotally mounted at one end of said intermediate member to maintain said upper key member partially closing the entrance of the coin-slot in its pivoted position at the other end of said intermediate member, means for supporting the depending bolt member out of engagement with the plunger, means for tripping the depending member from its support, and means pivotally mounted on the plunger adapted to engage and rotate said cylinder on the inward movement of the plunger.

6. In a coin-actuated vending-machine, the combination with a revoluble delivery-cylinder and a plunger having a shoulder, of coin-controlled locking means for said plunger consisting of a lever having a bolt freely depending from one end thereof and a coin-actuated key rising from the other end of said lever and terminating within and partially closing the entrance of the coin-slot, said bolt caused to automatically engage a shoulder of said plunger and to maintain the key in position to be depressed, a lug automatically engaged by said bolt to hold it in elevated position, and a weighted tappet-arm adapted to be struck by the inward movement of the plunger-shoulder to cause said tappet-arm to engage and release the bolt thereby causing it to fall to its normal position, and means actuated by said plunger to rotate said cylinder.

7. In a coin-actuated vending-machine, the combination of a rotating delivering-cylinder and a plunger having a shoulder, of coin-controlled locking means for said plunger consisting of a lever device of connected members including a coin-actuated key normally standing within and partially closing the entrance of the coin-slot, and a bolt member depending in position to automatically engage said plunger-shoulder, a lug to engage and hold the bolt up, and a tappet device arranged behind the bolt and depending in the path of the plunger-shoulder to release said bolt, and means actuated by said plunger to rotate said cylinder.

8. In a coin-actuated vending-machine, a goods-delivery cylinder, a plunger, a device for locking and for releasing said cylinder, a ratchet-wheel carried by the cylinder, a weighted arm pivotally mounted on said plunger and adapted to engage the teeth of the said ratchet-wheel, a stop on the plunger supporting said pivoted arm in its engagement with said ratchet-wheel to rotate said cylinder on the inward movement of the plunger, the outward movement of the plunger carrying said pivoted arm free of engagement with said ratchet-wheel.

9. In a coin-actuated vending-machine, delivery mechanism for the goods, a plunger, mechanism for locking and for releasing said plunger, mechanism for locking and for releasing said delivery mechanism and means whereby both said mechanisms are operated by the direct action of said plunger and the latter having at its coin-engaging end a strike or tooth for engaging a member of the delivery mechanism as described and for the purpose specified.

10. In a coin-controlled vending-machine, a plunger, mechanism for locking said plunger, mechanism actuated by said coin for releasing the plunger, goods-delivery mechanism, a device carried by said plunger, and a device operative in the path of said coin and in the path of said plunger whereby the delivery mechanism is actuated by the conjoint action of said coin and the plunger and both by the inward movement of said plunger.

11. In a coin-actuated vending-machine, a plunger, mechanism actuated by the coin to allow the inward movement of said plunger, and goods-delivery mechanism actuated by the conjoint movement of said coin and of said plunger, whereby the said coin is caused to have a lock-releasing function in two positions in its travel through the machine.

12. In a coin-actuated vending-machine, a plunger, means for locking it in its retracted position, a delivery-cylinder means for locking it, a lever carried by said plunger means carried by the latter for operating said cylinder, a dog in the path of the coin, the plunger-lock and the delivery-lock released by the same coin, at the entrance of the coin-passage and at the exit of said passage.

13. In a coin-actuated vending-machine and in combination, delivery mechanism for the goods, a plunger, and means for actuating the delivery mechanism consisting of means carried by said plunger and coöperating means in the path of said plunger, and coin-controlled locking mechanism for said plunger comprising pivotally-connected members one of which normally stands within a guide-opening at the entrance of the coin-slot and another member normally engaging the plunger, the coin acting through said connected members on entering the coin-slot to release the plunger and said coin on leaving the coin-slot actuating the release of the delivery mechanism.

14. In a coin-actuated vending-machine, and in combination, a goods-delivery cylinder, means carried by said plunger for actuating the cylinder, coin-controlled locking and releasing mechanism for said plunger comprising a vertically-slidable bolt, a lever to which said bolt is pivoted and a key pivoted to said lever and passing through the bottom of the coin-passage, and means automatically engaging said bolt for supporting it in its released position.

15. In a coin-actuated vending-machine, and in combination, delivery mechanism for the goods, a plunger, coöperating devices for locking the plunger and the delivery mechanism both devices actuated by gravity, and coöperating means for successively releasing the lock of each device, the release of the plunger being in advance of the release of the delivery mechanism.

811,502. **AX-HANDLE WEDGE.** LEO F. HERZOG, St. Louis, Mo. Filed Aug. 7, 1905. Serial No. 273,110.

Claim.—1. An ax-handle wedge, constructed with the body portion having a notch diagonally arranged in its top, there being grooves formed in the sides of the wedge that extend downwardly from the notch and said grooves gradually becoming shallower toward their lower ends, and locking-lugs integral with the sides of the wedge at the lower ends of the grooves which lugs are equal in width to the grooves and the top and bottom surfaces of which lugs are convex in cross-section, and said top surfaces being continuations of the bottom surfaces of the grooves; substantially as specified.

2. An ax-handle wedge, constructed with the body portion having a notch diagonally arranged in its top, there being grooves formed in the sides of the wedge that extend downwardly from the notch and said grooves gradually becoming shallower toward their lower ends, and locking-lugs integral with th sides of the wedge at the lower ends of the grooves which lugs are equal in width to the grooves and the top and bottom surfaces of which lugs are convex in cross-section, and said top surfaces being continuations of the bottom surfaces of the grooves in combination with a common staple fitted entirely within the grooves so that its lower ends are deflected outwardly by the top faces of the lugs; substantially as specified.

811,503. **FLUE-CLEANER FOR STOVES AND RANGES.** WILLIAM JAQUES, Royersford, Pa. Filed Feb. 16, 1905. Serial No. 245,870.

Claim.—1. The combination with two scrapers supported to reciprocate in the horizontal flue of a stove, toward and from an opening in the bottom plate of said flue, of means adapted for reciprocating the scrapers over said bottom plate and discharging clogging accumulation from the flue through the opening.

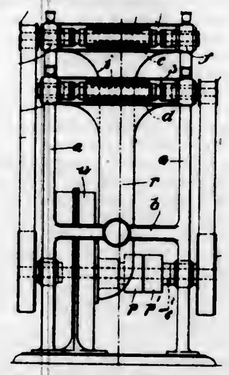
2. The combination with two scrapers supported to reciprocate in the horizontal flue of a stove, toward and from a transverse opening in the bottom plate of said flue near the longitudinal center of said bottom plate, of two rack-bars slidably supported in the flue above the scrapers and connected therewith, and means adapted for reciprocating said rack-bars so as to draw the scrapers over the opening.

3. The combination with two scrapers supported to reciprocate in the horizontal flue of a stove, toward and from a transverse opening therein, of a spur-gear supported to rotate in the flue above the scrapers, and having a pivot projected through the top plate of the flue, two rack-bars supported to reciprocate above the scrapers and respectively connected therewith, and a crank-handle adapted for engagement with the pivot of the gear for its rotation, thus reciprocating the rack-bars and drawing the scrapers toward and over the opening.

4. In a device of the character described, a bottom plate for the stove having an opening therein, the panel for closing said opening, and having rocking supports at its ends near the center of width, said supports oppositely engaging the edge portions of the opening, and the means for holding the panel closed.

5. In a device of the character described, the combination with the bottom plate of a stove, having a rectangular opening therein near its longitudinal center, and a pendent partition-strip hinged to swing in the horizontal bottom flue of the stove over said opening, of a panel having rocking support on opposite edges of the opening, whereby said panel may be rocked into an upright position therein, and a cam secured on a side of the panel, said cam being adapted for raising the partition-strip when the panel is rocked into a vertical or open position.

811,504. **BUFFING-MACHINE.** JOHN F. JENKINS, Lynn, Mass. Filed Apr. 26, 1905. Serial No. 257,313.



Claim.—1. A buffing-machine comprising a pair of side frames, and a pair of parallel rotatable abrasive buffing-rolls rigidly supported at thir opposite ends by said frames, said rolls being arranged in the same vertical zone, one of them being above and forward of the other, and both being a considerable distance above the base of the machine and adjacent each other.

2. A buffing-machine comprising a pair of vertical side frames, a pair of horizontal shafts journaled rigidly in bearings in said frames and extending across the space between them, one of said shafts being above and forward of the other, and cylindrical buffing-rolls rigidly supported by said shafts respectively between the frames, both rolls being arranged in the same vertical zone, and one of them being adapted for operating on the heel and the other on the sole of a shoe.

3. A buffing-machine comprising a pair of vertical side frames, a pair of horizontal shafts journaled in said frames and extending across the space between them, one of said shafts being above and forward of the other, independent driving means for the respective shafts, cylindrical buffing-rolls rigidly supported by said shafts respectively between the frames, both rolls being arranged in the same vertical zone, and each of them being adapted for operating on a separate part of the bottom of a shoe.

4. A buffing-machine comprising a pair of vertical sides frames, a pair of horizontal shafts journaled in said frames and extending across the space between them, one of said shafts being above and forward of the other, cylindrical abrasive buffing-rolls rigidly supported by said shafts respectively between the frames, both rolls being arranged in the same vertical zone, and one of them being adapted for operating on the heel and the other on the sole of a shoe, an air-duct having inlet-openings adjacent said rolls, and means for exhausting air from said duct.

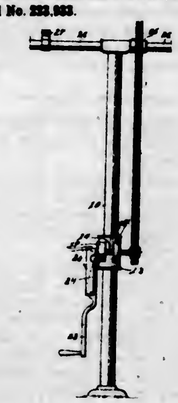
811,505. **GARMENT-SUPPORTER.** ISABELLE J. JOHNSON, Columbia, Mont. Filed May 6, 1905. Serial No. 259,289.

Claim.—1. A body-brace and garment-supporter comprising two sections, each consisting of a shoulder-strap, front and rear suspension-straps depending from the shoulder-strap, an armpit-strap connecting the outer edges of the shoulder and suspension straps, a back-strap independent of said armpit-straps and connecting the rear suspension-straps of the two sections, a waistband connected to the lower ends of the suspension-straps, said band being provided with a rear bracing enlargement and having its free end arranged to overlap at the front and provided with fastening means, and tabs depending from the belt in the plane of said suspending-straps.

2. A body-brace and garment-supporter comprising two sections, each consisting of a shoulder-strap, front and rear suspension-straps depending from the shoulder-strap, an armpit-strap connecting the outer edges of the shoulder and suspension straps, a back-strap connecting the rear suspension-straps of the two sections, a waistband connected to the lower ends of the suspension-straps, back and abdominal pads secured respectively to the rear portion and one of the ends of the waistband, the ends of the waistband being arranged to overlap at the front, and means for connecting the said ends of the waistband on opposite sides of the vertical line of the abdominal pad.

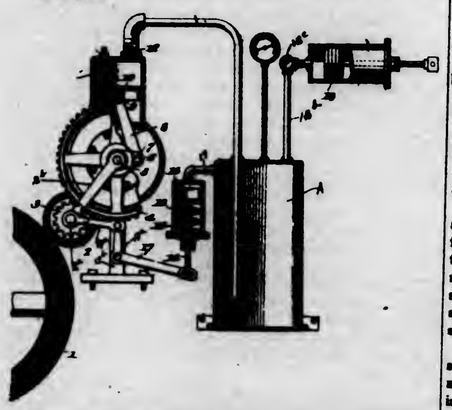
3. A body-brace and garment-supporter comprising two sections, each consisting of a shoulder-strap, front and rear suspension-straps depending from the shoulder-strap, an armpit-strap connecting the outer edges of the shoulder and suspension straps, a back-strap connecting the rear suspension-straps of the two sections, a waistband connected to the lower ends of the suspension-straps, and having an upward bracing extension at the rear and its ends arranged to overlap at the front, back and abdominal pads secured to the waist-band respectively below said bracing enlargement and to one of the ends of the band, and means for connecting the ends of the band on opposite sides of the vertical line of the abdominal pad.

811,506. **SASH-LIFTING APPARATUS FOR GREENHOUSES.** WILLIAM C. JOHNSTON and PHILIP J. FOLEY, Chicago, Ill. Filed Sept. 9, 1904. Serial No. 223,933.



Claim.—An improved sash-lifting apparatus for greenhouses, &c., comprising a fixed post, a sleeve having integral shaft-bearers and one of the bearers provided with teeth on its outer end surface, a shaft in said bearers having a fixed sprocket-wheel at one end, a handle connected with the end of the shaft, a bar pivotally connected with the central part of the handle and its top adapted to engage said teeth on the end of the bearer, a handhold fixed to the end of the handle to project at right angles thereto, an eccentric pivoted to the handhold and provided with an extension to overlie the handhold, a coil-spring on the handhold, a rotatable shaft mounted on top of the post and in bearers fixed to rafters and provided with a sprocket-wheel, a chain on the two sprocket-wheels to connect the two shafts and a cable coiled on the upper shaft and connected with the ends of a bar having a right-angled extension at its top extended into fastenings fixed to sashes, arranged and combined as set forth for the purposes stated.

811,507. AUTOMATIC AIR-BRAKE APPARATUS FOR AUTOMOBILES. FREDERICK KALBOW, St. Louis, Mo., assignor of one-eighth to Geo. D. Kluegel, St. Louis, Mo. Filed Mar. 24, 1905. Serial No. 251,922.



Claim.—1. The combination with the engine of an automobile of a friction-pulley riding on the fly-wheel of the engine, an air-pump operated by the rotation of the friction-pulley, a storage-tank, a brake-cylinder, tubular connections from the storage-tank to the air-pump and to the brake-cylinder, and means whereby the pressure within the storage-tank is utilized to automatically move the friction-pulley into and out of engagement with the fly-wheel of the engine; substantially as specified.

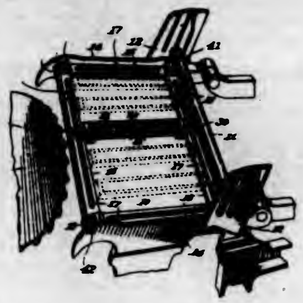
2. In an apparatus of the class described, a friction-pulley mounted so as to move into engagement with the fly-wheel of an engine, an air-brake pump, driving mechanism from the friction-pulley to the air-pump, a storage-tank, a brake-cylinder, tubular connections from the air-pump to the tank and from the tank to the brake-cylinder, a small cylinder connected to the storage-tank, a spring-actuating piston actuating therein, and suitable connections from the piston to the friction-pulley for moving the same into and from frictional engagement with the fly-wheel of the engine; substantially as specified.

811,508. NUMBERING MECHANISM FOR PRINTING-PRESSES. GEORGE H. KENDALL, New York, N. Y. Filed May 17, 1905. Serial No. 260,880.

Claim.—1. The combination of a chase provided with slots extending along opposite sides thereof, a numbering mechanism, a frame carrying said numbering mechanism, pins on the ends of said frame for engaging with said slots, and thumb-nuts on said pins for clamping said frame to said chase.

2. The combination of a chase provided with slots extending along opposite sides of the same, a frame, flanges on the ends of said frame and adapted to project beneath the slotted sides of said chase, pins on said flanges to project through said slots, thumb-nuts turned onto said pins for clamping said frame to said chase, and a numbering-head adjustable longitudinally in said frame.

3. The combination of a chase, a frame adjustable on said chase between two opposite sides of said chase, means for securing the ends of said frame to the sides of said chase, a plate movably mounted in said frame, a numbering-head longitudinally adjustable in said frame, a rotatable screw engaging with said numbering-head and having its head journaled in said plate, and means for turning said screw to clamp said numbering-head to said frame.



4. The combination of a chase, a frame adjustable on said chase between two opposite sides of said chase, means for securing the ends of the frame to the sides of the chase, a plate movably mounted in said frame, a numbering-head longitudinally adjustable in said frame, a rotatable screw engaging with said numbering-head and having its head journaled in said plate, a lever, a pin on said lever and passing into said screw and a set-screw in said rotatable screw and impinging on said pin.

5. The combination of a chase provided with slots extending along opposite sides of the same, a frame, flanges on the ends of said frame, pins on said flanges to project through said slots, thumb-nuts turned onto said pins for clamping said frame to said chase, a plate movably mounted in said frame, a numbering-head adjustable in said frame, a rotatable screw engaging with said numbering-head and having its head journaled in said plate, and means for turning said screw to clamp said numbering-head to said frame.

6. The combination of a chase, supports on the under side of said chase to elevate the same above the surface of the type-bed, a numbering mechanism, a frame carrying said numbering mechanism and adjustable in said chase with its ends projecting beneath opposite sides of the chase, and means for securing the ends of said frame to the sides of the chase.

7. The combination of a chase, supports on the under side of said chase to elevate the same above the surface of the type-bed, a frame adjustable in said chase and projecting at its ends beneath opposite sides of said chase, a numbering-head adjustably mounted in said frame, and means for securing the ends of said frame to the sides of said chase.

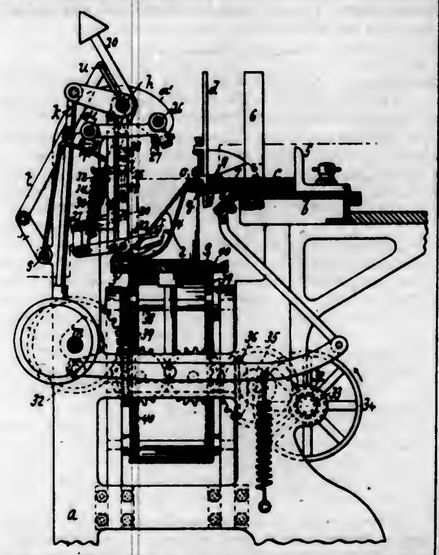
8. The combination of a chase having slots extending along opposite sides of the same, supports at the corners of the chase to elevate the chase above the surface of the type-bed, a frame, flanges on the ends of said frame to project beneath opposite sides of the chase between said supports, pins on said flanges to project through said slots, thumb-nuts turned onto said pins for clamping said frame to said chase, a numbering-head adjustable in said frame, and means for securing said numbering-head in its adjustments in said frame.

9. The combination of a numbering-machine provided with an operating-arm projecting above the printing-surface of said machine, an inking-roll movable back and forth over said machine, and guides for carrying said inking-roll clear of said arm.

10. The combination of a chase, a numbering-machine adjustable in said chase and provided with an operating-arm projecting above the printing-surface of said machine, an inking-roll movable back and forth over said machine, and guides having raised tracks for carrying said inking-roll clear of said operating-arm.

811,509. SIGNATURE-GATHERER. GEORGE H. KNOX and CHARLES L. SMITH, New York, N. Y. Filed May 2, 1905. Serial No. 258,259.

Claim.—1. A gathering-machine provided with a fixed sheet-support or delivery-board, a fixed front guide spaced from the board for enabling sheets to be cut therebetween in an overhanging position on the board, a fixed blast device directed against that edge of the lowermost sheet which is at the guide so as to separate or bend down the lowermost sheet, swinging grippers for withdrawing said lowermost sheet, a conveyer-belt for receiving the sheets from the grippers and sheet-guiding plates between which the grippers swing and which are fixed above the belt a suitable distance for sheets or signatures to be carried past thereunder.



2. A gathering-machine comprising a conveyer, a set of grippers, a rock-shaft for the grippers provided with an arm, a link connected to the arm, a second rock-shaft extending along a side of the conveyer and having fixed bearings and an arm engaged by the link, and a set of pressers extended from the second rock-shaft toward a side of the conveyer so as to press down on the signatures therein.

3. A gathering-machine comprising a plain delivery-belt, a fixed guide or channel for the belt, and sheet-guiding plates fixed to the guide at suitable intervals to receive signatures therebetween and sufficiently far above the belt to allow signatures to be carried by the belt past underneath the plates.

4. A gathering-machine comprising a guide *d*, a blower-tube, a delivery-channel, a movable belt forming the bottom of the channel and sheet-guiding plates along the channel carried by the channel and the blower-tube, said guide-plates being extended across the channel to form fixed transverse partitions along the same.

5. A gathering-machine comprising sheet or signature withdrawing gripper-jaws, mechanism for actuating one of the jaws to come to open or closed position, a signal and signal-actuating lug and a lug-actuating lever linked to the last-named jaw independently of its opening and closing mechanism.

6. A gathering-machine comprising a gripper-jaw and an oscillating arm to which said jaw is fixed, a second jaw pivoted to the fixed jaw, a signal and signal-actuating lug sliding on the arm of the fixed jaw, a lug-actuating lever linked to one part of the pivoted jaw, and a jaw-opening and jaw-closing toggle connected to another part of the pivoted jaw.

7. A gathering-machine comprising a gripper and a signal with signal-actuating dog, arms for opening the gripper, a lever for setting the dog, and a link for connecting the lever to the gripper, said link and arms being connected at different points to the gripper and said lever having the arm connected to the dog of greater length than the other lever-arm.

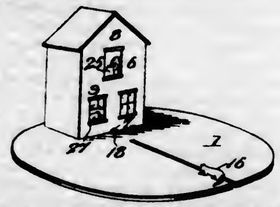
8. A gathering-machine comprising a gripper composed of jaws, one of which is in the form of a lever with arms of unequal length, a carrying-arm for the gripper, a dog slidingly mounted on the carrying-arm, a lever having arms of unequal length and having its longer arm directly pivoted to the dog, and a link between the shorter arm of the lever and the longer arm of the lever forming one of the gripper-jaws.

9. A gripper having a signal-actuator, a signal actuated thereby, a pivot on which the signal is mounted, an arm extended from the pivot portion of the signal and an actuating-spring for the signal, said spring being attached to the free or outer end of said arm and extended past its inner end and secured so that as the arm swings the spring is carried to one side or another of the pivot.

10. In a gathering-machine, a gripper having a movable jaw, a swinging gripper-supporting arm, a signal-actuator slidingly mounted on the supporting-arm, a lever-and-link connection between the movable jaw and the signal-actuator, a pivoted signal-lever actuated thereby, an arm connected to and extending laterally from the pivot portion of the signal, and a spring connected to the arm for moving the lever as the arm is swung to one side of the lever pivot or fulcrum.

11. A gripper having a signal-actuator, a pivoted signal-lever actuated thereby and having an arm extended to one side of the pivot, a fixed stud at the opposite side of the pivot, and a spring connected to the arm and stud so that as the signal-actuator moves the free end of the arm past the pivot-point the spring will move the signal.

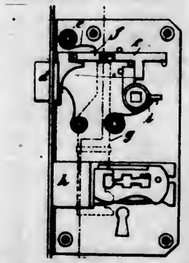
811,510. TOY. ROBERT H. KING, Beaufort, N. C. Filed Aug. 2, 1905. Serial No. 272,407.



Claim.—1. A toy comprising a circular platform formed with a radially-arranged slot projecting in one direction from the center of the platform and with two parallel slots extending in the opposite direction from the center of the platform, said platform being formed with an opening intermediate the face of the slots, a building structure secured to the platform to overlie the parallel slots, a plurality of rollers independently mounted adjacent the first-mentioned slot, a rod projecting from one of said rollers and extending through the slot, a rod projecting from the other of said rollers and extending through the opening, independently-mounted rollers respectively supported adjacent each of the parallel slots, rods projecting from said rollers and extending through the adjacent slot, and figures supported on the ends of the rods.

2. A toy comprising a circular platform formed with a radially-arranged slot projecting in one direction from the center of the platform and with two parallel slots extending in the opposite direction from the center of the platform, said platform being formed with an opening intermediate the face of the slots, a building structure secured to the platform to overlie the parallel slots and partially conceal the opening, a plurality of rollers independently mounted adjacent the first-mentioned slot, a rod projecting from one of said rollers and extending through the slot, a rod projecting from the other of said rollers and extending through the opening, independently-mounted rollers respectively supported adjacent each of the parallel slots, rods projecting from said rollers and extending through the adjacent slot, and figures supported on the face of the rods.

811,511. LOCK. EMIL H. F. KROHN, Hamburg, Germany. Filed Oct. 26, 1903. Serial No. 179,159.



Claim.—1. In a lock of door-lock type, the combination with the ordinary lock-bolt *h*, spring-latch *d* and bar *c* for retracting said latch; of a detachable connection *f* between said bar *c* and spring-latch *d*; and a supplementary lock-bolt *g* adapted to be oper-

cted by a special key and controlling the connection of the spring-latch with the means for retracting the same, substantially as described.

2. A door-lock comprising a main locking mechanism, a spring-latch, disconnectible means for operating said latch-operating mechanism, and a supplementary locking mechanism, disposed between, and operating in conjunction with said lock and latch operating mechanisms, substantially as and for the purpose specified.

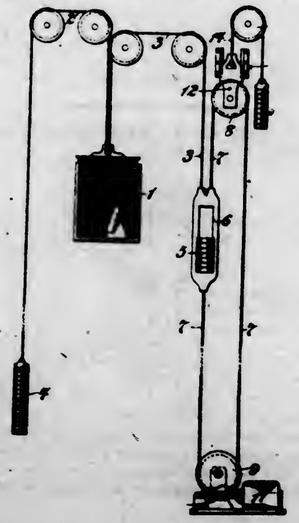
811,512. **FOOT-ARCH SUPPORTER.** FRANK B. LEE, Buffalo, N. Y., assignor to Lee Electric Insole Company, New York, N. Y., a Corporation of New York. Filed June 9, 1903. Serial No. 160,715.

Claim.—1. A foot-arch supporter adapted to fit the sole of the foot, being of greatest thickness and upwardly arched, substantially at its center to support the arch of the foot and being of substantially equal thickness and concaved at front and rear to receive the ball and the heel respectively, and terminating in a beveled edge around its front portion and with an edge semicircular in cross-section around its heel portion.

2. An aluminium foot-arch supporter to fit the sole of the foot, being of greatest thickness and arched at its center to sustain the arch of the foot, of substantially equal thickness and concaved at front and rear to receive the ball and heel respectively, and being formed with a flange outwardly and upwardly curved from the arched portion to sustain the inner edge of the foot and with a slight incurve opposite the flange, and having its greatest forward extension in front of the ball and terminating at its front in an inclined edge arranged at about the bases of the toes.

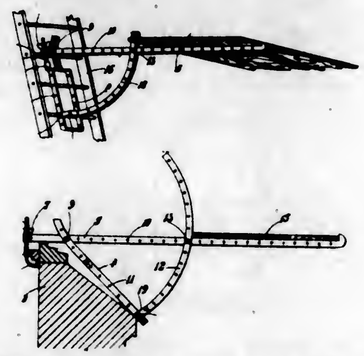
3. An aluminium foot-arch supporter to fit the sole of the foot, being of greatest thickness and arched at its center to sustain the arch of the foot, of substantially equal thickness and concaved at front and rear to receive the ball and heel respectively, and being formed with a flange outwardly and upwardly curved from the arched portion to sustain the inner edge of the foot and with a slight incurve opposite the flange, and having its greatest forward extension in front of the ball and terminating at its front in an inclined edge arranged at about the bases of the toes, the supporter being provided with a longitudinal row of ventilating-holes in its front portion, and a series of parallel sharpened cross-ribs on the under surface of its front.

811,513. **ELEVATOR.** HAROLD S. MACKAYE, Yonkers, N. Y., assignor, by mesne assignments, to Elevator Securities Company, a Corporation of New Jersey. Filed June 23, 1902. Serial No. 113,786.



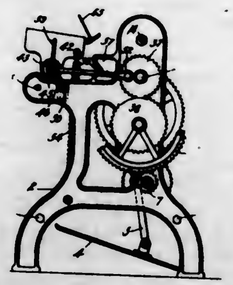
Claim.—In an elevator, a car, a carriage for operating the car, a driving-cable for said carriage attached at its ends above and below said carriage, a tension-sheave and a driving-sheave for said cable, a movable block in which said tension-sheave is pivoted, a weight and means operated by said weight for pressing said tension-sheave away from said driving-sheave.

811,514. **ADJUSTABLE BRACKET FOR EMPLOYMENT ON WINDOWS, LADDERS, AND PARAPETS.** CHARLES MILLS, Woolston, near Christchurch, New Zealand. Filed June 26, 1905. Serial No. 267,163.



Claim.—For the purpose indicated, a platform-bar, means for clipping the platform-bar upon a window-sill, a bifurcated arm pivoted to the platform-bar and having its lower part opened out, a stay-bar passing upon each side of and pivoted to the platform-bar and bifurcated at its lower end to engage the opened-out part of the bifurcated arm and a bolt for connecting the stay-bar to the bifurcated arm, substantially as set forth.

811,515. **PRINTING-PRESS.** THOMAS B. DOOLEY, Malden, Mass. Original application filed Apr. 10, 1903. Serial No. 151,974. Divided and this application filed Sept. 16, 1903. Renewed Dec. 11, 1905. Serial No. 291,264.



Claim.—1. In a printing-press, the combination with sprocket-wheels, sprocket-chains carried thereby, and means for driving the same, of inking-rollers carried by said sprocket-chains, and means for adjusting said rollers with relation to the path of said chain.

2. In a printing-press, the combination with sprocket-wheels and means for driving the same, of sprocket-chains containing a number of links each provided with an outwardly-extending arm, hubs adjustably mounted in said arms, and inking-rollers eccentrically journaled in said hubs, for the purpose set forth.

3. In a printing-press, the combination with inking-rollers and means for operating the same, of an ink-distributing table comprising a number of plates each providing an inking-surface and movable in a direction transverse to the path of the inking-rollers, means for reciprocating said plates, and a supplementary inking-table located in the path of said rollers and forming an extension of said ink-distributing table.

4. In a printing-press, the combination with inking-rollers and means for operating the same, of an ink-distributing table comprising a number of plates each providing an inking-surface and movable in a direction transverse to the path of the inking-rollers, and means for reciprocating said plates and for holding each plate stationary during the passage of said rollers over it.

5. In a printing-press, the combination with end uprights each provided with a socket 10, of plates 8 each provided with a hub fitted to one of said sockets and spacing said plate away from the corresponding upright, a type-bed and an inking-table carried respectively by the front and rear edges of said plates, said inking-table comprising a number of plates movable transversely with respect to each other, a shaft journaled in said hubs, and provided with means for reciprocating said plates, means for rotating said shaft, inking-rollers, and means for supporting and operating the same, substantially as described, a platen, and connections between said shaft and platen for operating the latter.

6. In a printing-press, an ink-distributing table comprising a frame provided with slots, plates guided to slide in said slots respectively, a rack-and-pinion connection between adjacent plates, and means for reciprocating said plates comprising a rotatable shaft provided with a cam-groove, and a traveler secured to one of said plates and entering said groove.

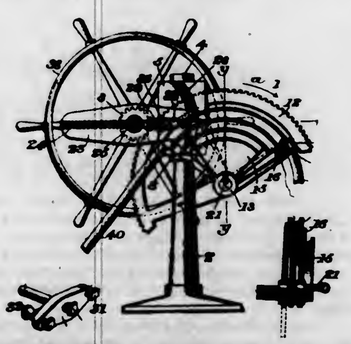
7. In a printing-press, the combination with uprights each provided with a socket 10 of plates 8 each provided with a hub fitted to one of said sockets, and a shaft journaled in said hubs.

8. In a printing-press, the combination with end uprights each provided with a socket 10, of plates 8 each provided with a hub fitted to one of said sockets and spacing said plate away from the corresponding upright, and a pair of sprocket-wheels journaled in each of the spaces thus provided, a sprocket-chain carried by each pair of sprocket-wheels, and inking-rollers carried by said sprocket-chains.

9. In a printing-press, the combination of a pair of uprights, a pair of plates located between said uprights and supported by the same respectively at points providing a continuous free space at the peripheries of said plates, a pair of sprocket-wheels journaled in each of said spaces, sprocket-chains carried by said sprocket-wheels, inking-rollers carried by said chains, and a type-bed and an inking-table carried by said plates and located in the path of said rollers.

10. In a printing-press, the combination of a frame, a type-bed carried on one side of said frame, an ink-distributing table carried on the opposite side of said frame, two pairs of sprocket-wheels and means for driving the same, a sprocket-chain carried by each pair of wheels, inking-rollers carried by said sprocket-chains, the ink-distributing table and type-bed being respectively located in the path of said rollers between the sprocket-wheels of each pair, and a supplementary inking-table located between the type-bed and the ink-distributing table, concentric with one of the axes of said gears.

811,516. **PIPE-BENDING MACHINE.** JAMES H. MULL, Philadelphia, Pa., assignor to Chicago Pneumatic Tool Company, Chicago, Ill., a Corporation of New Jersey. Filed Apr. 22, 1905. Serial No. 256,841.



Claim.—1. In a bending-machine, a bending-die, a support therefor, an angularly-adjustable rotatable face-plate having ways thereon extending upon opposite sides of the axis of the face-plate, a sliding abutment mounted in said ways and means for actuating said die.

2. In a bending-machine, a bending-die, a support therefor, an angularly-adjustable rotatable plate having ways therein extending upon opposite sides of the axis of the face-plate, a sliding abutment mounted in said ways, a carrier for supporting said die and plate, and means for locking said plate with respect to said carrier.

3. In a bending-machine, a bending-die, a support therefor, an angularly-adjustable rotatable plate having ways therein extending upon opposite sides of the axis of the face-plate, a sliding abutment mounted in said ways, a carrier for supporting said die and plate, and means for locking said plate with respect to said carrier, in combination with means for actuating said die.

4. In a bending-machine, a bending-die, a support therefor, an adjustable plate having ways therein, a sliding abutment mounted in said ways, a carrier for supporting said die and plate, a curved groove in said carrier, and locking devices common to said groove, and plate.

5. In a bending-machine, a bending-die, a carrier, a support, therefor, an adjustable plate having a longitudinally-extending groove or ways therein, a sliding abutment supported in said groove, means for locking said abutment in position, a curved groove in said carrier, and locking devices common to said groove and plate.

6. In a bending-machine, a carrier, means for supporting said carrier, a shaft mounted in suitable bearings, a quadrant-gear mounted on said shaft, a bending-die mounted on said shaft, a rotatable plate supported by said carrier, means common to said carrier and plate for locking said plate in the desired position and a sliding abutment carried by said plate and movable to opposite sides of the axis of the plate.

7. In a bending-machine, a standard, a carrier mounted thereon, a shaft having bearings in said carrier, a plurality of independently-movable bending-dies carried by said shaft at the same time, and means for maintaining any of said dies in operative relation with said shaft at will.

8. In a bending-machine, a support, a shaft therein, a plurality of independently-movable bending-dies on said shaft at the same time and angularly movable to operative or inoperative positions, and means for maintaining any of said dies in operative position.

9. In a bending-machine, a support, a shaft therein, a plurality of independently-movable bending-dies of different diameters on said shaft at the same time, and means for maintaining operative connection of any of said dies with said shaft in substantially the same bending-plane.

10. In a bending-machine, a support, a shaft therein, a plurality of successively-inclosed bending-dies upon said shaft at the same time, and angularly movable with respect to it, and means for maintaining any of said dies in operative angular relation to said shaft at will.

11. In a bending-machine, a bending-die, a shaft on which said die is mounted, a quadrant-gear mounted on said shaft, a pinion meshing with said quadrant-gear, a hand-wheel whereby said pinion and gear may be rotated in unison, an angularly-adjustable face-plate and a sliding abutment mounted on said face-plate.

12. In a bending-machine, a bending-die, a shaft on which said die is mounted, a quadrant-gear mounted on said shaft, a pinion meshing with said quadrant-gear, a hand-wheel whereby said pinion and gear may be rotated in unison, an angularly-adjustable face-plate having ways therein, a sliding abutment mounted in said ways, means for locking said face-plate in position, and means for locking said abutment in position.

811,517. **WEEDER-TOOTH.** SAMUEL A. MCCUNE, New Waterford, Ohio. Original application filed Oct. 27, 1904, Serial No. 230,204. Divided and this application filed Sept. 22, 1905. Serial No. 279,670.

Claim.—1. In a weeder, the combination with a supporting-frame, of a longitudinally-curved trailing tooth attached to said frame at one end, and a resilient strip or guard extending longitudinally of said tooth from its support and having both ends engaging the tooth.

2. In a weeder, the combination with a supporting-frame including a transverse angle-bar, of a longitudinally-curved tooth secured to and depending from said bar, a resilient bar or guard arranged to extend longitudinally of and having both ends engaging said tooth, the said guard bearing at one end against both the horizontal and vertical flanges of the angle-bar of the supporting-frame, and means for holding said bar in position.

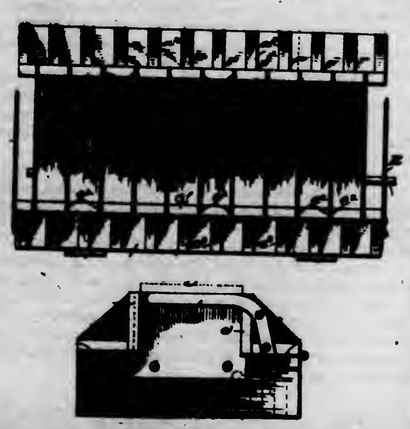
3. In a weeder, the combination with a supporting-frame including a transverse angle-bar, of a tooth comprising a longitudinally-curved section substantially round in cross-section throughout its length and having its upper end connected to said angle-bar, and a resilient guard engaging said curved section at both ends and bearing against the horizontal member of said angle-bar.

4. In a weeder, the combination with a supporting-frame including a transverse angle-bar, of a tooth comprising a longitudinally-curved section connected at its upper end to said angle-bar and having its lower end pointed and a separately-formed resilient guard extending longitudinally over and having both ends engaging said curved section, and means for securing the upper end of said guard to the said angle-bar of the supporting-frame.

5. In a weeder, the combination with a supporting-frame, of a weeder-tooth consisting of a longitudinally-curved body substantially round in cross-section, attached to said frame at its upper end, and a resilient strip or guard extending longitudinally of and having both ends engaging the body of the tooth.

6. The herein-described weeder-tooth including a longitudinally-curved body, substantially round in cross-section, and a guard, formed of a flat strip, arranged over a portion of said body, both ends of said guard being bent inwardly and engaging the curved body of the tooth.

811,518. **BRICK-MACHINE.** OLIVER HOLAH, Minneapolis, Minn. Filed July 27, 1905. Serial No. 271,469.



Claim.—1. In a brick-machine, the combination of a base, comprising pairs of longitudinal stringers spaced apart, cross-bars connecting the ends of the stringers, a horizontal plate resting upon the rear pair of stringers, and provided with a series of spaced grooves on its inner edge, a horizontal plate resting upon the outer stringer of the forward pair, a vertical plate secured to the inner edge of the horizontal plate, and provided with grooves on its inner face corresponding to the grooves on the rear horizontal plate, braces resting on the forward horizontal plate and connected with the vertical plate between the grooves, partition-plates having openings in their lower edges resting in the grooves of the vertical and rear horizontal plates and upon the inner stringer of the forward pair, a longitudinal bar secured to the inner face of the inner stringer of the front pair and provided with perforations, screw-threaded bolts provided with hooks for engaging the openings in the partition-plates, and extending to the perforations in the longitudinal bar, nuts engaging the bolts, a swinging frame hinged to the rear horizontal plate, and comprising a horizontal plate, a vertical plate secured to the free edge of the horizontal plate and provided with grooves to receive the free edges of the partition-plates, braces resting on the horizontal plate and connected to the vertical plate between the grooves, a plate secured to the lower face of the frame extending across the space between the vertical plates, and provided with openings to receive the partition-plates, and handles secured to either end of the frame at the level of the top of the partition-plates.

2. In a brick-machine, the combination of a base, comprising pairs of longitudinal stringers spaced apart, cross-bars connecting the ends of the stringers, a horizontal plate resting upon the rear pair of stringers and provided with a series of spaced grooves on its inner edge, a horizontal plate resting upon the outer stringer of the forward pair, a vertical plate secured to the inner edge of the horizontal plate and provided with grooves on its inner face corresponding to the grooves on the rear horizontal plate, braces secured to the outer face of the vertical plate between the grooves, partition-plates resting in the grooves of the vertical plate and the rear horizontal plates and upon the inner stringer of the forward pair, a longitudinal bar secured to the inner face of the inner stringer of the front pair, means for securing the partition-plates to the bar, a frame hinged to the rear horizontal plate, and comprising horizontal and vertical plates, a vertical plate having grooves on its inner face to receive the free edges of the partition-plates, a series of braces between the horizontal and vertical plates, a series of fingers secured to the frame and adapted to close the lower openings between the partition-plates, and handles secured to either end of the frame at a level with the top of the partition-plates.

3. In a brick-machine, the combination of a base, a series of partition-plates spaced apart and secured to the base, a vertical plate having grooves to receive the front edges of the partition-plates and resting upon the base, means for bracing the sections of the horizontal plate between the grooves, a swinging frame hinged to the base and comprising a series of fingers for closing the lower part of the opening between the partition-plates, and a vertical plate provided with grooves to receive the free edges of the partition-plates, means for bracing the sections of the vertical plates between the grooves, and handles secured to the vertical plate at a level with the tops of the partition-plates.

4. In a brick-machine, the combination of a base, a series of partition-plates secured to the base, means for closing the forward opening between the partition-plates, means for bracing said closing means, a swinging frame hinged to the base, and provided with a series of fingers for closing the lower part of the openings between the partition-plates, means on the frame for closing the rear openings between the partition-plates, and handles secured to the swinging frame at a level with the tops of the partition-plates.

5. In a brick-machine, the combination of a base, a series of partition-plates secured to the base, means on the base for closing the forward opening between the partition-plates, a swinging frame hinged to the base, means on the frame for closing the rear openings between the partition-plates, means on the frame for closing the lower opening between the partition-plates, and handles secured to the swinging frame at a level with the tops of the partition-plates.

6. In a brick-machine, the combination of a base, a series of partition-plates secured to the base, means on the base for closing the forward opening between the partition-plates, a swinging frame hinged to the base, means on the frame for closing the rear openings between the partition-plates, and means on the frame for closing the lower opening between the partition-plates.

7. In a brick-machine, the combination of a base, a swinging frame hinged thereto, and a series of molds, the sides and one end of the molds being secured to the base, and the bottom and the other end of the mold being secured to the swinging frame, and handles secured to the swinging frame at a level with the top of the mold.

8. In a brick-machine, the combination of a base, a swinging frame hinged thereto, a series of molds, the sides and one end of the molds being secured to the base, and the bottom and other end of the molds being secured to the swinging frame, handles secured to the swinging frame at a level with the top of the mold, and a plurality of cams engaging the bottoms of the molds to assist in starting the same.

9. In a brick-machine, the combination of the base, a swinging frame hinged thereto, a series of molds, the sides and one end of the mold being secured to the base, and the bottom and other ends of the molds being secured to the swinging frame, handles secured to the swinging frame at a level with the top of the mold, a plurality of cams engaging the bottoms of the molds to assist in starting the same, and means for moving the cams in unison.

811,519. **ELECTRIC SWITCH FOR STREET-RAILWAYS.** JAMES A. POSEY, Midlothian, Tex., assignor, by mesne assignments, to Posey Automatic Switching Company, a Corporation of Delaware. Filed Mar. 14, 1905. Serial No. 250,095.

Claim.—1. An electric switch for railways comprising a pivoted switch-tongue, a shifting-bar pivotally connected to said tongue, levers provided with suitable fulcrums and pivotally connected to said shifting-bar and disposed to move in the plane of said bar, mechanical means whereby a passing car may actuate either one of said levers, and electrical devices whereby a motorman upon a passing car can cause either lever to be actuated at will.

2. An electric switch for railways comprising a pivoted switch-tongue, a shifting-bar connected to said tongue and adapted to move said tongue to open or close the switch for either the main line or a branch line, levers capable of independent action pivotally connected to said shifting-bar, a hook normally disengaged from said levers, but set to actuate one of said levers and operable by the wheel of a passing car, and electrical devices by which a motorman on a passing car may set said hook to engage the other lever.

3. An electric switch for railways comprising a pivoted switch-tongue, a bar capable of reciprocal motion connected to said tongue levers capable of independent action pivotally connected to said bar, a spring-pressed bar carrying a pivoted hook, a spring normally controlling said hook to cause the same to engage one of said levers, an armature connected to said hook and a controlling-magnet whereby said hook may be caused to engage the other one of said levers, and a depressible lever operatively connected to said spring-pressed bar.

4. An electric switch for railways having a pivoted switch-tongue, a bar capable of reciprocal motion connected to said tongue a spring-pressed bar carrying a pivoted hook provided with a catch on each side, levers pivotally connected to said reciprocal-motion bar, means for causing said hook to engage either one of said levers, and a depressible lever operatively connected to said spring-pressed bar.

5. An electric switch for railways having a pivoted switch-tongue, a switch-tongue bar connected to said tongue and carrying a locking-yoke, levers pivotally connected to said switch-tongue bar, and an actuating-bar carrying a hook adapted to engage either one of said levers and carrying a roller engaging said locking-yoke whereby said switch-tongue bar is yieldingly held against accidental displacement.

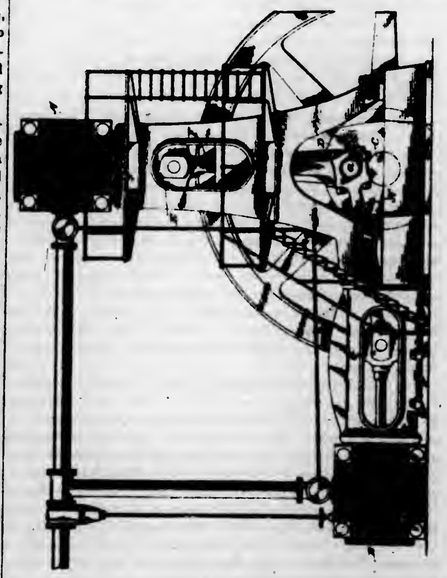
6. An electric switch for railways having a pivoted switch-tongue, a sliding bar attached to said switch-tongue, a locking-yoke mounted rigidly on said bar and provided with recesses in the edge thereof, levers pivotally connected to said sliding bar, and a spring-pressed actuating-bar carrying a hook adapted to engage either one of said levers, and carrying a roller adjacent to said yoke, said roller normally engaging said yoke in one of said recesses to hold said switch-tongue against accidental displacement.

7. An electric switch for railways having mechanical devices adapted normally when actuated by the wheels of a passing car for closing a switch, a magnet provided with a suitable armature for setting said mechanical devices for opening said switch, a flanking trolley-wire electrically connected to said magnet, said magnet being electrically connected with a rail of the railway, a circuit carried by the car, one arm of said circuit being connected to said flanking trolley-wire, and the other arm of said circuit being electrically connected with the main trolley-wire, and a key for opening and closing said circuit, substantially as described.

8. An electric switch for railways having mechanical devices normally adapted when actuated by the wheels of a passing car for closing a switch, and electrical devices adapted to put said mechanical devices in condition for opening said switch consisting of a magnet provided with an armature operatively connected to said mechanical devices, a circuit carried by a car one arm of said circuit being electrically connected to said magnet, and the other arm of said circuit being electrically connected with a supply of electricity for the car, and a key for opening or closing said circuit, substantially as described.

9. An electric switch for railways having mechanical devices normally adapted when actuated by the wheels of a passing car for closing a switch, a magnet provided with an armature operatively connected to said mechanical devices adapted for opening said switch, a flanking trolley-wire, a trolley-fork carrying a trolley-wheel and being attached to the main trolley-pole of the car, a circuit carried by the car, one side of said circuit being connected to said trolley-fork and the other side of said circuit connected to the main trolley-pole, said flanking-trolley being electrically connected to said magnet, and a key for said circuit, substantially as described.

811,520. **STEAM-ENGINE.** EDWIN REYNOLDS, Milwaukee, Wis., assignor to Allis-Chalmers Company, Chicago, Ill., a Corporation of New Jersey. Filed Aug. 20, 1900. Renewed Jan. 9, 1905. Serial No. 240,236.



Claim.—1. In an engine of the class described, the combination of a frame, a rotatable crank-shaft mounted therein and provided with a single crank disk or arm having a single wrist-pin, high and low pressure cylinders the axes of which are arranged in horizontal and vertical planes respectively and substantially at an angle of ninety degrees each to the other, so that their longitudinal axes meet substantially at the crank-shaft, a reciprocating piston in each of

said cylinders provided with outwardly-extending piston-rods, and a connecting-rod for each of said piston-rods connected with the single wrist-pin independently and in parallel arrangement, substantially as described.

2. In an engine of the class described, the combination of a frame portion, a rotatable crank-shaft mounted therein and provided with a single crank disk or arm having a single wrist-pin, a horizontally-arranged high-pressure and a vertically-arranged low-pressure cylinder set substantially at an angle of ninety degrees each to the other so that their longitudinal axes meet substantially at the crank-shaft, a reciprocating piston in each of said cylinders provided with an outwardly-extending piston-rod, and a connecting-rod for each of said piston-rods connected with the single wrist-pin independently and in parallel arrangement, substantially as described.

3. In an engine, the combination of a frame; a shaft provided with crank disk or arm and crank-pin; a vertical low-pressure cylinder and piston; a horizontal high-pressure cylinder and piston; connections between the respective pistons and the common crank-pin, the low-pressure piston connection being nearest the crank arm or disk; and a counterweight carried by the shaft and serving to counterbalance both the vertically and the horizontally moving parts.

4. In an engine, the combination of a frame having a shaft provided with crank disk or arm and crank-pin; a high and a low pressure cylinder set at an angle of ninety degrees each to the other, the low-pressure cylinder being vertically placed; pistons carried by the respective cylinders; connections between said pistons and the common crank-pin, the low-pressure piston connection being nearest the crank arm or disk; and a counterweight common to both the vertically and the horizontally moving members, and set in relation thereto substantially as described, whereby when either piston is at its extreme throw from the shaft, the counterweight shall be at its extreme throw on the opposite side of said shaft.

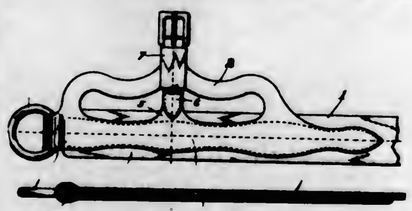
5. In an engine, the combination substantially as herein set forth, of a frame; a shaft provided with two crank arms or disks each having a crank-pin; and two pairs of engines each comprising a vertical cylinder, piston, piston-rod, and pitman, and a horizontal cylinder, piston, piston-rod, and pitman, the vertically and horizontally moving pistons of one engine pair or unit being connected to the crank-pin of one crank arm or disk, and the vertically and horizontally moving pistons of the other engine pair or unit being connected to the crank-pin of the other crank arm or disk, and the power of the engine being applied at a point between the two units, substantially as and for the purposes set forth.

6. In an engine, the combination substantially as herein set forth, of a frame; a shaft provided with two crank arms or disks each having a crank-pin; two pairs of engines each comprising a vertical cylinder, piston, piston-rod, and pitman, and a horizontal cylinder, piston, piston-rod, and pitman, constituting one unit, the vertically and horizontally moving pistons of one engine pair or unit being connected to the crank-pin of one crank or disk, and the vertically and horizontally moving pistons of the other engine pair or unit being connected to the crank-pin of the other crank arm or disk; and counterbalances applied to said shaft one for each engine pair, each counterbalance arranged to make its extreme throw on one side of the shaft at the instant that the piston on the opposite side of the shaft reaches its extreme throw in a direction opposite said counterbalance, the power of the engine being applied at a point intermediate the two units.

7. In an engine, the combination of a plurality of units or engine couples, each comprising an upright and a horizontal cylinder with its piston, rod, &c.; and a crank-shaft having a crank-pin for each unit or engine couple, the two cylinders of each couple being set at substantially ninety degrees to each other, and the several cranks being set at such angular distances apart that the time interval between successive impulses imparted to the shaft shall be equal to the time of one revolution divided by twice the number of cooperating cylinders, the crank-shaft of each unit or engine couple being formed separate from that of other units or couples, whereby each crank-shaft or section of the common crank-shaft is permitted to deflect or spring under and in accordance with its own load.

8. In an engine, the combination of a plurality of engine couples, each comprising an upright and a horizontal cylinder with its piston, rod, &c., and a crank-shaft having a crank-pin for each unit or engine couple, the two cylinders of each couple being set at substantially ninety degrees to each other, and the several cranks being set at angular distances apart equal to thirty degrees or multiples thereof, and in general so set that the time interval between successive impulses imparted to the shaft shall equal the time of one revolution divided by twice the number of cylinders in this combination, the crank-shaft being divided into sections one for each engine couple or unit, whereby each is permitted to deflect or spring in accordance with its own load.

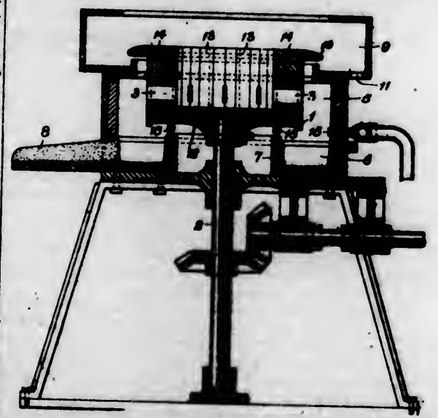
811,521. **STAY FOR HARNESS-BREECHING.** FRANK X. SCHUMAKER, Fort Scott, Kans. Filed Mar. 1, 1904. Serial No. 196,166.



Claim.—1. In a breeching-stay for harness of the character described, a stay of the configuration shown, constructed of a single piece of leather, and comprising a body portion, inwardly-extending arms, a central support integral with the body portion and the arms; substantially as described.

2. In a breeching-stay for harness of the character described, the combination of a breeching, a stay stitched to the breeching, inwardly-extending arms integral with the stay, a central support integral with the central portion of the stay and with the inwardly-extending arms; substantially as described.

811,522. **TREATING MOLTEN METAL.** JOSEPH S. SHARAN, Pittsburg, Pa. Original application filed May 28, 1904. Serial No. 209,311. Divided and this application filed July 25, 1904. Serial No. 217,986.



Claim.—1. As an improvement in the art of treating molten metal the method herein described, which consists in dividing the metal into small streams by causing the metal to pass through small orifices by centrifugal action and maintaining in the separator a sufficient body of metal to cover the discharge-orifices whereby the good metal is caused to be separated in passing through the orifices from the slag and other impurities and an escape of the gas is permitted, substantially as set forth.

2. As an improvement in the art of treating metal, the method herein described which consists in dividing the metal into small streams by forcing the metal by centrifugal action through small orifices, maintaining in the separator a sufficient body of metal to cover the discharge-orifices and while the metal is in a divided condition, subjecting it to the action of air under pressure, substantially as set forth.

811,523. **METHOD OF MAKING HAIRE-SPRING.** FRANCIS L. STEWART, Murrysville, Pa., assignor of one-half to Samuel R. Gill, Pittsburg, Pa. Filed Oct. 17, 1904. Serial No. 228,782.

Claim.—1. The method herein described which consists in sterilising maize before the close of the milky period of the kernel, continuing the growing of the plant to permit an increase of sugar content in the stalk, then extracting the juice, clarifying it and reducing it to sugar or syrup; substantially as described.

2. The method herein described which consists in separating the ears from growing field-maize while the ears are in the milk, continuing the growing of the plant to permit an increase of sugar content in the stalk, then extracting the juice, clarifying and reducing it to sugar or syrup; substantially as described.

3. The method herein described which consists in sterilising maize when the ear is in the milk, continuing the growing of the plant for more than two weeks until an increase of sugar content takes place in the stalk, then extracting the juice, clarifying it and reducing it to sugar or syrup; substantially as described.

4. The method herein described which consists in separating the ears from growing maize while the ears are still immature and are at the stage of growth, at which the ear is in the milk and the protruding silk is dead, continuing the growing of the plant until an increase of sugar content takes place in the stalk, then extracting the juice, and clarifying it and reducing it to sugar or syrup; substantially as described.

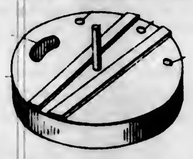
811,524. **TREATMENT OF MAIZE FOR THE MANUFACTURE OF CELLULOSE PRODUCTS.** FRANCIS L. STEWART, Murrysville, Pa., assignor of one-half to Samuel R. Gill, Pittsburg, Pa. Filed Mar. 31, 1905. Serial No. 253,126.

Claim.—1. The method herein described which consists in growing stalks of maize and preventing the formation of ripened ears thereon, continuing the growth of the stalks beyond the normal period of pollination, and thereby causing a largely-increased development of the cellular structure, then cutting the stalk and treating it for the production of cellulose products.

2. The method herein described which consists in sterilising the stalks of maize, continuing the growth after such sterilization and thereby causing a largely-increased development of the cellular structure, then cutting the stalk and treating it for the production of cellulose products.

3. The method herein described which consists in planting maize so that the stalks will be in close proximity, sterilizing the stalks, continuing the growth after such sterilization, and thereby causing a largely-increased development of the cellular structure, then cutting the stalk and treating it for the production of cellulose products.

811,525. **AIR-BRAKE.** WILLIAM L. STEARNAGE and WILLIAM H. COOK, Bellefontaine, Ohio. Filed June 23, 1905. Serial No. 266,653.



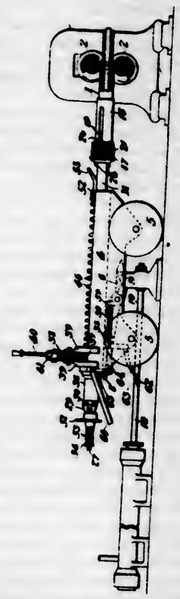
Claim.—In an air-brake valve, the port D, so situate with relation to the port that furnishes constant supply to the train-line, and to the valve, that it sounds warning whenever the valve lops the supply-port, as and for the purpose set forth.

811,526. **MECHANISM FOR FEEDING TUBULAR BILLETS.** RALPH C. SHEPPEL, Mineral City, Pa., assignor, by mesne assignments, to National Tube Company, a Corporation of New Jersey. Continuation of application Serial No. 80,296, filed Apr. 17, 1901. This application filed Jan. 2, 1902. Serial No. 87,625.

Claim.—1. In a feeding mechanism and in combination with a mandrel-bar and means for supporting and advancing said mandrel-bar, the improvement consisting in an end support for the billet movable relative to the mandrel and from its active position in respect to the billet.

2. In a feeding mechanism and in combination with a mandrel-bar and means for supporting and advancing said mandrel-bar, the improvement consisting in an end support for the billet movable relative to the mandrel and from its active position in respect to the billet, and means for securing the end support in and releasing it from an active position.

3. In a feeding mechanism and in combination with a mandrel-bar and means for supporting and advancing said mandrel-bar, the improvement consisting in an end support for the billet movable relative to the mandrel and from its active position in respect to the billet, and means for engaging and holding the end support in an inactive position.



4. In a feeding mechanism and in combination with a mandrel-bar, means for supporting and advancing said mandrel-bar, the improvement consisting in an end support for the billet movable from its active position in respect to the billet, means for holding the support in and releasing it from its active position, and means for catching it in an inactive position when so released.

5. In a feeding mechanism and in combination with a traveling carriage, a spindle reciprocably and rotarily mounted on the carriage, means for rotating the spindle and resilient means for actuating the spindle longitudinally, the improvement which consists in an end support for the billets or tubes reciprocable relatively to the spindle, and means for securing the end support in and releasing it from an active position.

6. In a feeding mechanism and in combination with a traveling carriage, a spindle reciprocably and rotarily mounted on the carriage, means for rotating the spindle and resilient means for actuating the spindle longitudinally, the improvement which consists in an end support for the billets or tubes reciprocable relatively to the spindle, and means for engaging and holding the end support in an inactive position.

7. In a feeding mechanism and in combination with a traveling carriage, a spindle reciprocably and rotarily mounted on the carriage, means for rotating the spindle and resilient means for actuating the spindle longitudinally, the improvement which consists in an end support for the billets or tubes reciprocable relatively to the spindle, means for holding the support in and releasing it from its active position, and means for catching it in an inactive position when so released.

8. In a feeding mechanism and in combination with a traveling carriage, a spindle reciprocably and rotarily mounted on the carriage, means for rotating the spindle and resilient means for actuating the spindle longitudinally, the improvement which consists in a motion-damping device on the carriage for checking the motion of the spindle.

9. In combination with the reciprocable spindle, a feeding mechanism, a retractable support movable relatively to the spindle, and means for holding the support in position, said means combining a controlling connection extending longitudinally of the spindle,

rigid means at one end thereof for holding the support as aforesaid, means for locking the said controlling connection in the vicinity of its other end.

10. In combination with the reciprocable spindle of a feeding mechanism, a retractable support movable relatively to the spindle, and means for holding the support in position, said means having a controlling connection extending longitudinally of and coaxially with the spindle for the purposes set forth.

11. In a feeding mechanism of the type having a reciprocable spindle and a traveling carriage upon which the spindle reciprocates, the improvement consisting in a power-actuated movable body and a self-coupling connection between the carriage and the said movable body, substantially as set forth.

12. In a feeding mechanism of a type having a reciprocable spindle and a traveling carriage upon which said spindle reciprocates, an improvement consisting in a movable body, means for automatically coupling the carriage to the said body, and means acting on a part of the coupling means for uncoupling the carriage from said body, substantially as set forth.

13. In a feeding mechanism of the type having a reciprocable spindle and a traveling carriage, upon which the spindle reciprocates, an improvement consisting in a power-actuated movable body, and a link on one of said parts for automatically engaging the other, substantially as set forth.

14. In a feeding mechanism of the type having a reciprocable spindle, and a traveling carriage, consisting in a power-actuating movable body, a link on one of said parts for automatically engaging the other, and means for disengaging the link, substantially as set forth.

15. In a feeding mechanism and in combination with a traveling carrage, a spindle mounted on the carriage, and resilient means for actuating the spindle longitudinally, the improvement which consists in an end support for the billets or tubes reciprocable relatively to the spindle, means for securing the end support in and releasing it from an active position, and a power-actuated movable body and a self-coupling connection between the carriage and the said movable body, substantially for the purposes set forth.

16. In a feeding mechanism of the type having a traveling carriage and a spindle reciprocating upon said carriage, the improvement consisting in means for rotating the spindle and means for supporting the end of the billets or tubes, which means reciprocates relatively to said spindle.

811,527. **PAPER-MAKING MACHINE.** ALONZO ALDRICH, Beloit, Wis. Filed Aug. 10, 1904. Serial No. 220,333.

Claim.—1. A device for lifting and separating a pair of rolls disposed one above the other said device having a vertically-movable bar and means for lifting said bar from below, said bar having means for engaging and lifting the shaft of the upper roll and for receiving lateral support therefrom, and said bar having also means for engaging and lifting the shaft of the lower roll and for restraining it from moving laterally, substantially as described.

2. In a device of the class described, the combination with a pair of rolls, of a bar having seats adapted to receive the shafts of the rolls, said seats being disposed a greater distance apart than are the parts of the shafts which they are adapted to engage, a shaft located below and in the vertical plane of the axes of the rolls, means for turning the shaft last aforesaid, and means for transmitting the movement of said shaft to the said bar, substantially as described.

3. In a device of the class described, the combination with the shafts of a pair of rolls, of a bar having seats adapted to engage said shafts, a cam, means for turning said cam, and means through which the cam bears upon the bar, substantially as described.

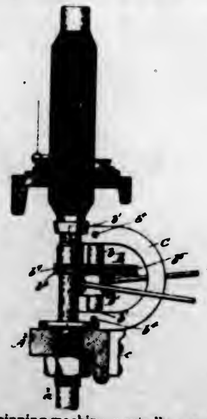
4. In a device of the class described, the combination with a pair of rolls and their shafts, of a bar having seats adapted to engage said shafts, a cam adapted to move the bar upward, a shaft carrying said cam, a lever for turning the shaft, and a bearing in which the shaft is mounted, substantially as described.

5. In a device of the class described, the combination with a pair of rolls and their shafts, of a bar having seats adapted to engage said shafts, a cam adapted to move said bar upward, a shaft carrying the cam, and means for turning the shaft, the lower end of the bar and shaft having sliding engagement with each other whereby the bar is permitted to move endwise and restrained against lateral movement, substantially as described.

6. In a device of the class described, the combination with a pair of rolls and their shafts, of a bar having seats adapted to engage said shafts and having a longitudinal slot, a shaft occupying the longitudinal slot of the bar, a cam carried by the shaft last aforesaid, a socket also carried by said shaft, a lever having its ends fitted in said socket, and an antifriction-roller carried by the bar and engaging the cam, substantially as described.

7. The combination with a pair of rolls, disposed one above the other, and having extended shafts, a support for the upper shaft movable vertically but immovable horizontally and a removable support for the lower shaft, of a device for lifting and separating said rolls, said lifting device having means for engaging the upper shaft whereby the shaft is lifted and the lifting device sustained horizontally and said lifting device having means for engaging the lower shaft whereby it is lifted and sustained against lateral movement, permitting its support to be removed, substantially as described.

811,528. **SPINNING MECHANISM.** JOHN J. BUCKLEY, THOMAS P. MCGINN, and JOHN A. ROGAN, Plymouth, Mass., assignors of one-fourth to Thomas Roche, Boston, Mass. Filed Apr. 28, 1905. Serial No. 257,831.



Claim.—1. In a spinning-machine, a spindle, a speed-multiplier means for supporting it independently of any spindle, a belt connecting said speed-multiplier with said spindle, and means located on said speed-multiplier whereby power may be applied to rotate said speed-multiplier.

2. In a spinning-frame, one or more spindles, a power-disk means for supporting said power-disk independently of any spindle, and means for rotating said power-disk, and belt connections for imparting motion from said power-disk to said spindle or spindles, as described.

3. In a spinning-frame, a pair of spindles, a power-disk, means for rotating it and means such as a belt for connecting said power-disk and said spindles, whereby a positive movement is imparted to said spindles from said power-disk, as set forth.

4. A speed-multiplier for a spinning-frame, comprising a yoke, and an axle mounted thereon carrying a grooved pulley, and a whirl of less diameter than said pulley whereby a speed received by said whirl from a source of power may be multiplied in its delivery and a spindle rotated by a belt upon said pulley.

5. In a spinning-frame, as a means of rotating the spindles in pairs, a shaft or axle mounted between two spindles, having a whirl and two driving-pulleys, a driving-belt for the whirl, a whirl upon each spindle and a driving-belt extending from its individual pulley upon the shaft or axle to a whirl, each of said belts being crossed to afford a greater frictional contact with the pulley and the whirl.

6. In a spinning-frame, as a means of rotating the spindles thereof in pairs, the combination of two spindles, an interposed shaft or axle, means for rotating it, pulleys thereon, one of which is connected by means of a crossed belt with one of the spindles and the other of which is connected by means of a crossed belt with the other of the spindles, as and for the purposes described.

7. In a spinning-frame, the combination of two spindles, an interposed shaft or axle, means for turning it, a pulley for each spindle mounted upon said shaft or axle, a crossed belt for each of said spindles and pulleys, the said pulleys being slightly inclined to a horizontal plane, whereby the sections of the belts crossing each other cross at different levels, as and for the purposes described.

8. In a spinning-frame, the combination of two spindles, an interposed shaft or axle located in close proximity to said spindles, means for turning said shaft, pulleys thereon and belts, each connecting one of said pulleys with one of said spindles, each belt being crossed between its pulley and its spindle, whereby it engages nearly the entire circumference of each, as set forth.

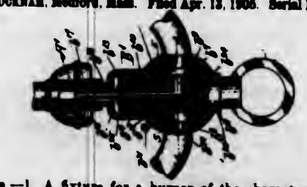
9. In a spinning-frame, a power-disk and means for supporting it comprising an axle, a socket adapted to support one end of said axle, and provided with bearings therefor, and means for adjusting the relation of said axle and said socket, as described.

10. In a spinning-frame, a power-disk and means for supporting it comprising an axle, a socket adapted to support one end of said axle, and provided with ball-bearings arranged as described and containing an oil-chamber surrounding said axle and communicating with the bearings thereof, as set forth.

11. In a spinning-frame, in combination, two spindles, a power-disk and a belt connection between each spindle and said power-disk, and means to rotate said power-disk, the axis of said power-disk being set at a slight angle to the axis of said spindles, as described.

12. In a spinning-frame, a spindle, a power-disk and a belt connection crossed between said spindle and said power-disk, and means to rotate said power-disk, the axis of said power-disk being set at a slight angle to the axis of the spindle, whereby the sections of the belt connecting said power-disk and spindle will not rub where they cross each other, as described.

811,529. **GAS-BURNER AND FIXTURE THEREFOR.** ROBERT M. BUCKNAM, Medford, Mass. Filed Apr. 13, 1905. Serial No. 255,421.



Claim.—1. A fixture for a burner of the character specified, the same having separate gas and air conducting pipes, a cock comprising an outer casing having means with which the burner may make connection and to the opposite sides of which casing the said pipes of the fixture are adapted to be connected, a vertical plug contained within the valve-chamber inside said casing, passages leading from said pipes through the wall of said casing, and passages within said plug opening into the mixing-chamber of the burner, which passages are adapted to register with the passages in the casing, when said plug is turned in one direction or position, or to break connection therewith when turned in another direction or position.

2. A fixture for a burner of the character specified, the same having separate gas and air conducting pipes, a cock having an outer casing with which said gas and air conducting pipes of the fixture are adapted to make connection, a plug contained within the valve-chamber of said casing inside the same, passages leading from said pipes through the wall of the casing, gas and air passages within said plug and extending through the same to open into the mixing-chamber of the burner and which gas and air passages in said plug are located to simultaneously register, respectively, with said gas and air passages in the casing, when said plug is in a certain position relatively to said casing, or to become disconnected therefrom and the gas and air entirely cut off upon turning said plug to a changed position, and which gas and air passages within said plug and casing are so related that upon slightly turning said plug within the casing, when said plug is in a certain position, the quantity of air admitted to the mixing-chamber of the burner will not be changed, but the quantity of gas admitted to said chamber will be changed.

3. A fixture for a burner of the character specified, the same having separate gas and air conducting pipes, a cock having an outer casing with which said gas and air conducting pipes of the fixture are adapted to make connection, a plug contained within the valve-chamber of said casing inside the same, passages leading from said pipes through the wall of the casing, gas and air passages within said plug and extending through the same to open into the mixing-chamber of the burner, and which gas and air passages are so related in relative size and location that upon slightly turning said plug, when the same is in a certain position, the quantity of air admitted through said plug and casing to the mixing-chamber of the burner will not be changed, but the quantity of gas admitted thereto will be changed.

4. A fixture for a burner of the character specified, the same having separate gas and air conducting pipes, a cock having an outer casing with which said gas and air conducting pipes of the fixture are adapted to make connection, a plug contained within the valve-chamber of said casing, passages communicating with said pipes and leading through said casing, gas and air passages within said plug and extending though the same to open into the mixing-chamber of the burner, which gas and air passages in said plug and casing are located to register simultaneously with one another, when said plug is in a ceratin position, whereby both gas and air may together simultaneously pass to the mixing-chamber of the burner, or said gas and air be together cut off on turning said plug to a changed position, and the size of which air-passage in the said plug is so related or graduated by the contraction thereof relatively to the size of the air-passage in said casing and said gas-passages that upon slightly turning said plug within the casing the quantity of air admitted to the mixing-chamber of the burner will not be changed, but the quantity of gas admitted to said chamber will be changed or lessened.

5. A fixture for a burner, the same having a cock comprising an outer casing and an inside vertical plug, means for retaining said plug within said casing, and a cap forming a portion of said cock for concealing said means of retention, and which cap is adapted also to receive the burner-tube.

6. In a fixture for a burner, a cock comprising an outer casing and an inside vertical plug, a threaded head on said casing, means for retaining said plug within said casing, a cap b^{12} forming a portion of said cock adapted to screw onto said threaded head of the casing, for concealing said means of retention, which cap is open to the end of said plug and which cap, also, is threaded in part to receive the burner-tube.

7. A fixture for a burner of the character specified, the same having separate gas and air conducting pipes, a cock having an outer casing with which said gas and air conducting pipes of the fixture are adapted to make connection, a plug contained within the valve-chamber of said casing inside the same, a passage communicating with the gas-conducting pipe and extending through said casing, one or more gas-passages within said plug, located to register with said gas-passage in the casing when the plug is turned to a certain position and to extend through said plug to open into the mixing-chamber of the burner, and which gas-passages in said casing and plug are so relatively disposed that the gas will become gradually cut off upon turning said plug, and in combination with said gas-passages, an air-passage in communication with the air-conducting pipe and extending through the wall of the casing, a passage b^{24} within the plug, registering therewith, and a contracted air-passage b^{25} extending through the plug to open into the mixing-chamber of the burner, which gas and air passages are so related that the gas and air may be simultaneously cut off upon turning said plug to a closed position, or the amount of gas partially cut off without changing the supply of air upon slightly turning the said plug.

8. A cock for a burner of the character specified, the said cock having an outer casing adapted to receive gas and air conducting pipes, a plug contained within the valve-chamber of said casing inside the same, passages leading from said pipes through the wall of the casing, gas and air passages within said plug and extending through the same to open into the mixing-chamber of the burner and which gas

and air passages in said plug are located to simultaneously register, respectively, with said gas and air passages in the casing, when said plug is in a certain position relatively to said casing, or to become disconnected therefrom and the gas and air entirely cut off upon turning said plug to a changed position, and which gas and air passages within said plug and casing are so related that, when said plug is in a certain position, upon slightly turning the same within the casing the quantity of air admitted to the mixing-chamber of the burner will not be changed, but the quantity of gas admitted to said chamber will be changed.

9. A cock for a burner of the character specified, the said cock having an outer casing adapted to receive gas and air conducting pipes, a plug contained within the valve-chamber of said casing, passages leading from pipes through the wall of the casing, gas and air passages within said plug and extending through the same to open into the mixing-chamber of the burner, and which gas and air passages are so related in relative size and location that, when said plug is in a certain position, upon slightly turning the same within the casing the quantity of air admitted to the mixing-chamber of the burner will not be changed, but the quantity of gas admitted to said chamber will be changed.

10. A cock for a burner of the character specified, the said cock having an outer casing adapted to receive gas and air conducting pipes, a plug contained within the valve-chamber of said casing, passages communicating with said pipes and leading through said casing, gas and air passages within said plug and extending through the same to open into the mixing-chamber of the burner, which gas and air passages in said plug and casing are located to register simultaneously with one another, when said plug is in a certain position, whereby both gas and air may together pass to the mixing-chamber of the burner or said gas and air be together cut off on turning said plug to a changed position, and which air-passage also in said plug is so related or graduated by the contraction thereof relatively to the air-passage in the casing and said gas-passages that upon slightly turning said plug the quantity of air admitted to the mixing-chamber of the burner will not be changed, but the quantity of gas admitted to the mixing-chamber will be changed.

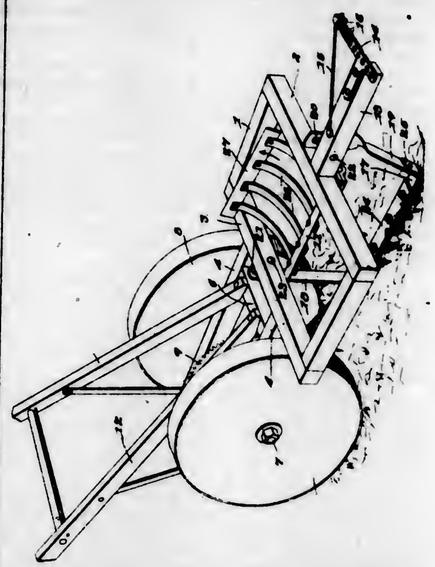
11. A cock for a burner of the character specified, the said cock having an outer casing adapted to receive gas and air conducting pipes, a plug contained within the valve-chamber of said casing inside the same, a passage communicating with the gas-conducting pipe and extending through said casing, one or more gas-passages within said plug, located to register with said gas-passage in the casing when the plug is turned to a certain position and to extend through said plug to open into the mixing-chamber of the burner, and which gas-passages in said casing and plug are so relatively disposed that the gas will become gradually cut off upon turning said plug, and in combination with said gas-passages, an air-passage in communication with the air-conducting pipe and extending through the wall of the casing, a passage b^{34} within the plug, registering therewith, and a contracted air-passage b^{35} extending through the plug to open into the mixing-chamber of the burner, which gas and air passages are so related that the gas and air may be simultaneously cut off upon turning said plug to a closed position, or the amount of gas partially cut off without changing the supply of air upon slightly turning the said plug.

12. A cock for a burner of the character specified, said cock having an outer casing adapted to receive gas and air conducting pipes, a plug contained within the valve-chamber inside said casing, passages leading from said pipes through the wall of said casing, gas and air passages within said plug opening into the mixing-chamber of the burner, which passages are adapted to register with the passages in the casing when said plug is turned in one direction or position, or to break connection therewith when said plug is turned in another direction or position, and in combination with said passages, a gas by-passage in communication with the gas-conducting pipe and extending independently through the wall of said casing to the valve-casing on the interior thereof, an annular groove formed in said plug and located at a point to register with the end of said passage, and a passage extending from said annular groove through said plug to connect with the said gas-passage extending through the same and connecting with the mixing-chamber of the burner, substantially as and for the purposes set forth.

811,530. COTTON-CHOPPER. BLANCH C. BUTLER, Asheville, N. C. Filed Sept. 21, 1905. Serial No. 279,510.

Claim.—1. A runner, a cutter supported thereon, a shaft supported for rotation, and a cutter connected with the shaft and engaging the runner-supported cutter.

2. In a machine for chopping out plants, a cutter supported stationary with relation to the frame, and a rotary cutter engaging therewith.



3. In a machine for chopping out plants, a cutter supported adjacent to the row of plants operated upon, and a movable cutter engaging therewith.

4. In a machine for chopping out plants, a cutter supported adjacent to the row of plants operated upon, and a movable cutter connected with and supported by a rotary shaft for engaging therewith.

5. In a machine for chopping out plants, a relatively stationary cutter, and means for supporting said cutter adjacent to a row of plants; in combination with a movable cutter adapted for engagement with a stationary cutter, a shaft supported for rotation, and supporting means connecting said shaft with the movable cutter.

6. In a machine for chopping out plants, a cutter supported adjacent to the row of plants, a shaft supported for rotation, and resilient carrying-arms connected with the shaft, and a cutter carried by said arms.

7. A frame, a runner connected adjustably therewith, a cutter supported upon the runner, a shaft supported for rotation, and a cutter connected with said shaft and engaging the cutter supported upon the runner.

8. A frame, a runner having arms connected adjustably with the frame, a cutter supported upon the runner, and a movable cutter engaging therewith.

9. A frame, carrying-wheels supporting the rear part of the frame, a runner supporting the front part of the frame, a cutter supported upon the runner, and a movable cutter engaging therewith.

10. A frame, carrying-wheels for the frame, a runner partly supporting the frame, a cutter supported upon the runner, and a movable cutter engaging therewith.

11. A frame, carrying-wheels connected therewith, a runner connected with the frame adjacent to and spaced from the line of draft, a cutter supported upon the runner, and a movable cutter engaging therewith.

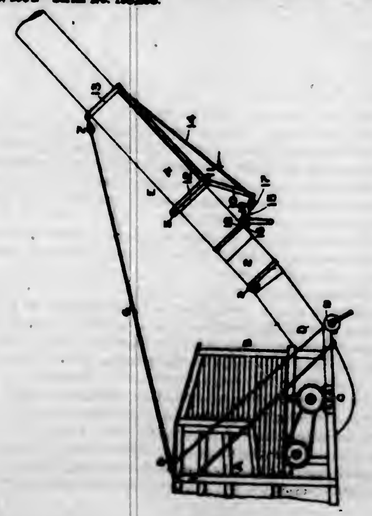
12. In a machine for chopping out plants, a frame having rearward-extending side members, a wheel-carrying axle connected for rotation with said side members and having a bevel-gear, a longitudinal shaft supported for rotation and having a pinion meshing with the bevel-gear, carrying-arms extending from said shaft, a cutter carried by said arms, a runner having arms connected with the frame for vertical adjustment, and a cutter supported upon the runner.

13. A frame, carrying-wheels connected therewith, a runner connected with and partly supporting the frame said runner being disposed adjacent to the longitudinal center of the frame, a cutter supported upon the runner, a movable cutter engaging therewith, a stub-tongue connected with the frame, and a lateral draft-bar connected with the tongue.

811,581. WINDOW-SASH PIVOT. FRITZ J. GARRAT, Louisville, Ohio. Filed Apr. 20, 1905. Serial No. 256,488.

Claim.—In a window of the class described, a window-frame, and a sash-frame, the vertical rails of the sash-frame provided with metal strips having ribbed and grooved faces, channel-bars or strips, located adjacent and in normal contact with the metal strips upon the vertical members of the sash-frame, and provided with ribbed and grooved faces, plates located between the metal strips and vertical sash-rails and provided with studs extended through the metal strips, said studs having reduced end portions, plates secured to the channel-bars and provided with open flaring flanges having smooth rings, springs adapted to span the flanged openings and the springs secured to the reduced portions of the studs, substantially as and for the purpose specified.

811,583. PNEUMATIC STACKER. HENRY J. DAWE, Hopkins, Minn., assignor to Severin W. Swenson, Minneapolis, Minn. Filed Feb. 6, 1905. Serial No. 244,288.

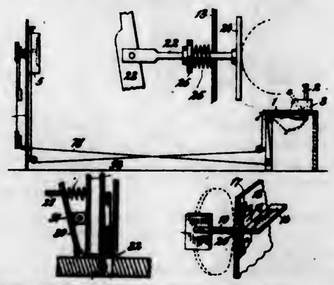


Claim.—1. In a pneumatic stacker, in combination, a foldable discharge-trunk having two hinged sections, an arm secured to the side of the upper section opposite the hinge, said arm extending downwardly and outwardly at an acute angle with said trunk-section and being of sufficient length to overlap the lower trunk-section when the trunk is extended, a cable connected with the arm and means upon the side of the lower section opposite the hinge for operating the cable.

2. In a pneumatic stacker, in combination, a foldable discharge-trunk having two hinge-connected sections, an arm secured to the side of the upper section opposite to the hinge, and extending downwardly and outwardly therefrom and at an acute angle therewith, said arm being of sufficient length to extend beyond the outer side of the lower section when the upper section is folded back, a cable connected with the arm, and cable-operating means upon the side of the lower section opposite to the hinge.

REISSUES.

12,440. SHOOTING-GALLERY. WILLIAM J. BOWERMAN, Detroit, Mich. Filed Dec. 5, 1905. Serial No. 290,402. Original No. 801,844, dated Oct. 17, 1905.



Claim.—1. In a coin-controlled machine of the character described, a laterally-movable sectional operating-lever, means for retaining said lever in upright position, including a movable bar, and means whereby one section may be moved relative to the other and actuate said retaining means to remove the same from the path of the lever, upon the insertion of a coin.

2. In a coin-controlled machine of the character described, an operating-lever pivoted for rocking movement, comprising sections slidable upon one another, means for normally retaining said lever in a stationary position, and means whereby one of said sections may slide and actuate said retaining means to move the same out of the path of the lever upon the insertion of a coin.

3. In a coin-controlled machine of the character described, an operating-lever pivoted at its lower end for rocking movement comprising sections slidable upon one another, means arranged intermediate the ends of the lever for normally retaining the same in upright position, means whereby one of said sections may be slid, means on said slidable section operatively associated with the retaining means to actuate and release the same upon the insertion of a coin, and resilient means for retaining said sections in normal position.

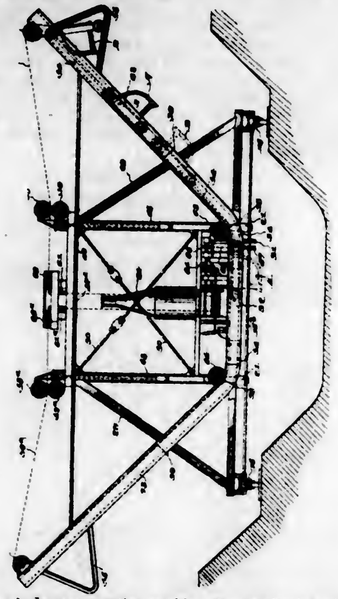
4. In a coin-controlled machine of the character described, an operating-lever comprising an inner section and an outer section having a slidable telescoping connection therewith, a lug on the outer section, a look for retaining said lever from movement, and releasing means actuated by said lug and operatively associated with said locking means for releasing the lever upon the insertion of a coin.

5. In a coin-controlled machine, the combination of an operating-lever comprising an inner section and an outer section having a slidable telescoping connection therewith, a look for retaining the said lever from movement, and means operatively associated with the outer section for moving said locking means out of the path of the lever upon the insertion of a coin.

6. In a coin-controlled machine, the combination of an operating-lever comprising an inner section and an outer section having a slidable telescoping connection therewith, a look for retaining said lever from movement, means operatively associated with the outer section for moving said locking means out of the path of the lever

upon the insertion of a coin, and means for retaining said sections in extended position.

12,441. **EXCAVATING-MACHINE.** CHARLES C. JACOBS, Amboy, Ill., assignor to The Jacobs' Steel Excavator Company, Amboy, Ill., a Corporation of Illinois. Filed Dec. 26, 1905. Serial No. 293,423. Original No. 794,410, dated July 11, 1905.



Claim.—1. In an excavating-machine, the combination with a supporting-frame, of a bucket-supporting track mounted thereon transversely of the ditch or trench to be dug and conforming to the cross-sectional profile of the latter, an excavating-bucket pivotally mounted to travel on said track, and means for drawing said bucket back and forth over said track, substantially as described.

2. In an excavating-machine, the combination with a supporting-frame, of a bucket-supporting track mounted thereon transversely of the ditch or trench to be dug and conforming to the cross-sectional profile of the latter, an excavating-bucket mounted to travel on said track, means for drawing said bucket back and forth over said track, and automatic bucket-discharging means on the end of said track, substantially as described.

3. In an excavating-machine, the combination with a supporting-frame, of a bucket-supporting track mounted thereon transversely of the ditch or trench to be dug and conforming to the cross-sectional profile of the latter, a pair of oppositely-faced excavating-buckets pivotally mounted to travel on said track, one of said buckets cutting and filling and the other returning idly on each travel across the ditch, and means for drawing said buckets back and forth over the track, substantially as described.

4. In an excavating-machine, the combination with a supporting-frame, of a bucket-supporting track mounted thereon transversely of the ditch or trench to be dug and conforming to the cross-sectional profile of the latter, a pair of oppositely-faced excavating-buckets pivotally mounted to travel on said track, one of said buckets cutting and filling and the other returning idly on each travel across the ditch, a link connecting said buckets, and means for drawing said buckets back and forth over the track, substantially as described.

5. In an excavating-machine, the combination with a supporting-frame, of a bucket supporting and guiding track mounted thereon transversely of the ditch or trench to be dug and conforming to the cross-sectional profile of the latter, means for bodily raising and lowering said track in a vertical plane by a single operation, an excavating-bucket mounted to travel on said track, and means for drawing said bucket back and forth over the latter, substantially as described.

6. In an excavating-machine, the combination with a supporting-frame, of a bucket supporting and guiding track mounted thereon transversely of the ditch or trench to be dug and conforming to the cross-sectional profile of the latter, means for bodily raising and lowering said track in a vertical plane, a pair of oppositely-faced connected excavating-buckets mounted to travel on said track, one of said buckets cutting and filling and the other returning idly on each travel from end to end of the track, and means for drawing said buckets back and forth over the latter, substantially as described.

7. In an excavating-machine, the combination with a supporting-frame, of a bucket supporting and guiding track mounted thereon transversely of the ditch or trench to be dug and conforming to the cross-sectional profile of the latter, automatic bucket-discharging means on each end of said track, means for raising and lowering said track, a pair of oppositely-faced connected excavating buckets or scoops mounted to travel on said track, one of said buckets cutting and filling and the other returning idly on each travel from end to end of the track, and means for drawing said buckets back and forth over the track, substantially as described.

8. In an excavating-machine, the combination with a supporting-frame, of a bucket supporting and guiding track mounted thereon transversely of the ditch or trench to be dug and conforming to the cross-sectional profile of the latter, means for bodily raising and lowering said track in a vertical plane by a single operation, an excavating bucket or scoop mounted to travel on said track, means for drawing said bucket back and forth over said track, and means for advancing the machine bodily from one cutting position to another, substantially as described.

9. In an excavating-machine, the combination with a supporting-frame, of a bucket-carrier mounted thereon and comprising a transversely-extending frame consisting of a horizontal intermediate section and upwardly and outwardly inclined end sections, a track comprising supporting and guiding rails extending from end to end of said carrier-frame, a truck mounted to travel on said track, a depending excavating bucket or scoop pivotally mounted on said truck, and means for drawing the truck back and forth over the track, substantially as described.

10. In an excavating-machine, the combination with a supporting-frame, of a bucket-carrier mounted thereon and comprising a transversely-extending frame consisting of a horizontal intermediate section and upwardly and outwardly inclined end sections adjustable relatively to said intermediate section, a track comprising supporting and guiding rails extending from end to end of said carrier-frame, a truck mounted to travel on said track, a depending excavating bucket or scoop mounted on said truck, and means for drawing the truck back and forth over the track, substantially as described.

11. In an excavating-machine, the combination with a supporting-frame, of a bucket-carrier mounted thereon and comprising a transversely-extending frame consisting of a horizontal intermediate section and upwardly and outwardly inclined end sections, said end sections being hinged to said intermediate section so as to be angularly adjustable relatively thereto, a track comprising supporting and guiding rails extending from end to end of said carrier-frame, a pair of connected trucks mounted to travel on said track, oppositely-faced excavating buckets or scoops yieldably mounted on and depending from said trucks, and means for drawing said trucks back and forth over the track, substantially as described.

12. In an excavating-machine, the combination with a supporting-frame and a transversely-disposed bucket-carrier mounted thereon, of a continuous track on said carrier having openings formed in the supporting-rails of the track near its ends, a bucket-supporting truck mounted to travel on said track and having wheels of different widths of tread at its opposite ends, one pair of wheels being adapted to drop through said openings of the track and the other pair to ride over the latter, and an auxiliary track adapted to support the narrow wheels of the truck and guide the bucket into discharging position, substantially as described.

13. In an excavating-machine of the class described, the combination with a bucket supporting and guiding track, of a truck mounted to travel thereon, an open-faced bucket or scoop pivotally mounted at its rear end between the side bars of said truck, and means affording a limited play of the forward end of said scoop transversely of the truck-frame, substantially as described.

14. In an excavating-machine of the class described, the combination with a bucket supporting and guiding track, of a pair of trucks mounted to travel thereon, a link connecting the inner adjacent axles of said trucks, a pair of open-faced excavating buckets or scoops pivotally and oppositely mounted in said trucks, respectively, and cables connected to said trucks and serving to alternately actuate the latter from end to end of said track, substantially as described.

15. In an excavating-machine, the combination with a supporting-frame, of a bucket supporting and guiding track mounted thereon transversely of the ditch or trench to be dug and conforming to the cross-sectional profile of the latter, screw-threaded rods rotatably mounted in said frame and supporting said track, means for rotating said rods whereby to bodily raise and lower said track, an excavating-bucket mounted to travel on said track, and means for drawing said bucket back and forth over the latter, substantially as described.

16. In an excavating-machine, the combination with a supporting-frame, of a bucket-carrier mounted thereon and comprising a transversely-extending frame consisting of a lengthwise-adjustable horizontal intermediate section, and upwardly and outwardly inclined end sections, a bucket-supporting track extending from end to end of said bucket-carrying frame, and a bucket or scoop mounted to travel over said track, substantially as described.

17. In an excavating-machine, the combination with a supporting-frame, of a bucket supporting and guiding track mounted thereon transversely of the ditch or trench to be dug and conforming to the cross-sectional profile of the latter, means for bodily raising and lowering said track in a vertical plane by a single operation through successive parallel positions, an excavating-bucket mounted to travel on said track, and means for drawing said bucket back and forth over the latter, substantially as described.

18. In an excavating-machine, the combination with a supporting-frame, of a bucket-supporting track mounted thereon transversely of the ditch or trench to be dug and conforming to the cross-sectional profile of the latter, a pair of excavating-buckets mounted to travel on said track, and means for discharging said buckets one at each end of the track, respectively.

19. In an excavating-machine for digging ditches, the combination with a supporting-frame, of a guide-track supported thereby and arranged transversely to the trench-line and conformable to the transverse contour of the trench; a pair of oppositely-facing excavating-buckets supported to travel back and forth along said guide-track; and flexible connection between the buckets permitting them to individually conform in their travel to deviations from a right line in the longitudinal contour of the guide-track.

20. In an excavating-machine for digging ditches, the combination with a supporting-frame, of a guide-track supported thereby and arranged transversely to the trench-line and conforming to the transverse contour of the trench; a pair of oppositely-facing and relatively spaced excavating-buckets supported to travel along said guide-track; flexible connection between the buckets permitting them to individually conform in their travel to deviations from a right line in the longitudinal contour of the guide-track; and means for drawing the pair of excavating-buckets back and forth along the track.

12,442. **HORN FOR PHONOGRAPHS, EAR-TRUMPETS, &c.** GUSTAVE H. VELLY, Manchester, England, assignor to United States Horn Company, New York, N. Y., a Corporation. Filed Oct. 26, 1903. Serial No. 178,351. Original No. 739,964, dated Sept. 29, 1903.

Claim.—1. A collapsible but self-sustained phonograph-horn, ear-trumpet or the like comprised of a number of flexible strips having curved meeting edges substantially as set forth.

2. A collapsible but self-sustained phonograph-horn, ear-trumpet or the like comprising a number of flexible strips having curved meeting edges and mounted on a flexible foundation, substantially as and for the purposes hereinbefore set forth.

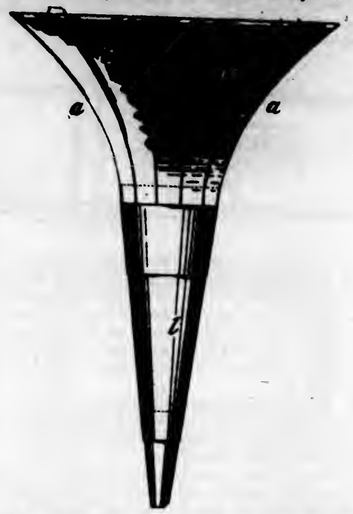
3. A collapsible but self-sustained phonograph-horn, ear-trumpet or the like comprising a number of flexible strips having curved meeting edges, a flexible foundation for said strips and means for detachably securing the two extreme strips together, substantially as set forth.

4. A collapsible but self-sustained phonograph-horn, ear-trumpet or the like comprising a number of flexible strips having curved meeting edges, flexible connections between such edges and protecting means on the outer exposed edges, substantially as set forth.

5. A phonograph-horn, ear-trumpet or the like comprising a rigid conical tube and a collapsible trumpet-shaped mouth, the latter being made up of a number of flexible strips having curved meeting edges, and flexible connections at such edges, substantially as hereinbefore set forth.

6. A horn of the class described comprising a rigid conical tube, and a collapsible trumpet-shaped mouth made up of a number of flexible strips having curved meeting edges, said mouth being connected to said rigid conical tube, substantially as described.

7. A horn of the class described comprising a rigid conical tube, and a collapsible trumpet-shaped mouth made up of a number of flexible strips having curved meeting edges, said mouth being tangentially connected to said conical tube, substantially as described.



8. A phonograph-horn or the like comprising a number of flexed strips having curved meeting edges, and means joining said edges, said strips being so flexed and said edges so curved and joined that the horn is given a trumpet-like or bell-like form, the strips forming angles where said edges meet.

9. A phonograph-horn or the like comprising a number of strips each having a foundation or facing of linen or the like, said strips being so flexed and their edges so curved and joined that the horn is given a trumpet-like or bell-like form, the strips forming angles where said edges join or meet.

10. A phonograph-horn comprising a number of strips joined or meeting at their edges, said strips being so flexed and said edges so curved that the horn is given a trumpet-like or bell-like form; the strips forming angles where said edges join, and protecting means on the outer exposed edges or ends of the strips.

11. A horn comprising a funnel-like portion and a trumpet-shaped mouth portion, the latter comprising a number of strips provided with means joining them at their edges, said strips being flexed and said edges curved so as to produce the trumpet form of said mouth portion, and said strips having angular relation to one another, substantially as described.

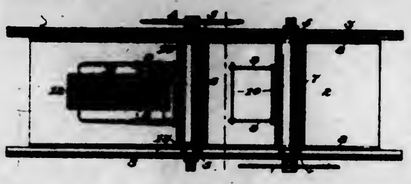
12. A phonograph-horn comprising a number of flexed strips having curved meeting edges, means joining said strips edge to edge, said strips being so flexed and said edges so curved and joined that the horn is given a trumpet-like or bell-like form, the strips forming angles where said edges meet, and protecting devices applied upon the outer exposed edges or ends of the strips.

13. A phonograph-horn comprising a funnel-like portion and a mouth portion, the latter comprising a number of side portions extending lengthwise of the horn and joining one another at their borders, forming angles where joining, said sides so curved at their corner portions and so flexed as to give the mouth portion a trumpet-like or bell-like form, and their outer exposed ends being provided with protecting means.

14. A horn comprising a funnel-like portion and a trumpet-shaped mouth portion, the latter comprising a number of strips or sides provided with means joining them at their edges, said strips being flexed and said edges curved so as to produce the trumpet form of said mouth portion, and said strips having angular relation to one another, and protecting means on the outer exposed edges or ends of the strips.

12,443. **APPARATUS AND PROCESS FOR MANUFACTURING WIRE-GLASS.** THE SCHUMACHER WIRE GLASS COMPANY, New York, N. Y., assignee, by mesne assignments, of Ralph Longenecker, administrator of Edmund C. Schmertz, deceased. Filed Jan. 6, 1906. Serial No. 294,812. Original No. 791,216, dated May 30, 1905.

Claim.—1. The process of making glass sheets with wire inclosed therein, consisting in simultaneously forming a layer of glass and introducing wire thereto, and completing the sheet by forming another layer upon the first layer of glass, the process being carried on progressively.



2. An apparatus for making sheets of glass with wire inclosed therein, consisting of a table, a leading roll to roll a layer of glass, means to support and introduce wire to the said layer, a second roll, behind the leading roll, to form a layer of glass on the first or underneath layer, the periphery of the second roll being higher above the table than that of the leading roll, and the two rolls being far enough apart to allow the glass for the second or upper layer to be poured between them.

3. In the manufacture of wire-glass, the combination of a table; a leading roll; means for introducing the wire in advance of the leading roll and a second roll whose body is higher from the bed of the table than that of the leading roll.

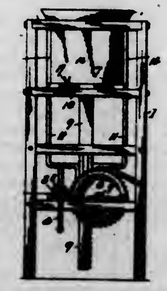
4. In the manufacture of wire-glass, the combination of a table; a leading roll with recessed ends; means for introducing the wire in advance of the leading roll and a second roll whose body is higher from the bed of the table than that of the leading roll.

5. In the manufacture of wire-glass, the combination of a table; a leading roll; means for introducing the wire in advance of the leading roll and a second roll whose body is substantially twice as high from the level of the casting-table as is the body of the leading roll.

6. An improvement in the process of manufacturing wire-glass which consists in rolling a sheet of glass of less thickness than the ultimate product required; simultaneously forcing wire upon said sheet and forming a second sheet of glass upon said first sheet.

7. An improvement in the process of manufacturing wire-glass which consists in rolling a sheet of glass of about half the ultimate thickness required; simultaneously with the formation of said sheet forcing wire in said sheet and forming a second sheet upon said first sheet.

12,444. **MACHINE FOR MOLDING CONCRETE BODIES.** WHITE CONCRETE MACHINE COMPANY, Columbus, Ohio, assignee, by mesne assignments, of Marion A. Wingel, deceased. Filed June 2, 1905. Serial No. 263,626. Original No. 694,122, dated Feb. 25, 1902.



Claim.—1. A machine for molding concrete bodies, comprising in combination a framework and fixed cores projecting therefrom and a mold-box adapted to be raised and lowered about said cores.

2. A machine for molding concrete bodies, comprising in combination a framework and fixed cores projecting therefrom, and a mold-box and bottom plate therefor adapted to be raised and lowered about said cores.

3. A machine for molding concrete bodies comprising in combination a framework and fixed cores projecting therefrom, a mold-box and means for raising the same about the said cores.

4. A machine for molding concrete bodies comprising in combination a framework and fixed cores projecting therefrom, a mold-box, a bottom plate therefor and means for raising and lowering the mold-box and bottom plate about the said cores.

5. A machine for molding concrete bodies comprising in combination a framework and fixed cores supported therein, a mold-box having hinged sides and ends, and means for raising and lowering the said mold-box.

6. A machine for molding concrete bodies comprising in combination a framework, fixed cores, a mold-box having hinged sides and ends, a bottom plate to which the said sides and ends are hinged, means for raising and lowering the said mold-box and means for retaining the sides and ends in a vertical position when the mold-box is in a lowered position and permitting the sides and ends to fold outward when the mold-box is in a raised position.

7. A machine for molding concrete bodies comprising in combination a framework and fixed cores supported therein, a mold-box having its sides and ends hinged at their lower portions and means for retaining said sides and ends in vertical positions until the lower portion of the mold-box is elevated to the top of the frame and means for raising and lowering said mold-box.

8. A machine for molding concrete bodies comprising in combination a framework, a shaft journaled in said framework and pinions on said shaft, of a mold-box having hinged sides and ends and rigid cores adapted to extend within said mold-box, of sliding rack-bars, supporting devices on said rack-bars connected with said mold-box, the teeth of said pinions adapted to gear with the pinions of said rack-bar.

9. A machine for molding composition blocks comprising in combination a framework having connected standards and a fixed bed-plate 10 and fixed cores extending vertically from said bed-plate, a mold-box movably supported above said bed-plate, a bottom plate 18 in said mold-box, a mold-plate 22 removably supported on said bottom plate, the sides and ends of said mold-box being hinged in their lower portions, rollers journaled between the main frame and the mold-box sides and ends and means for raising and lowering said mold-box.

10. A machine for molding composition bodies, comprising in combination a stationary framework, a fixed bed-plate 10 therein, rigid cores 21 rising from said bed-plate, a mold-box above the bed-plate, a bottom plate in the mold-box, vertically-movable rack-bars, mold-box-supporting arms extending from said rack-bars and having a hinge connection with the sides of said mold-box, the ends of said mold-box having a hinge connection with the bottom plate thereof, rollers journaled in the upper portion of the framework and adapted to retain the sides and ends of the mold-box in vertical positions until said mold-box has been elevated to a predetermined height and means for raising and lowering said rack-bars.

11. In a machine for molding concrete bodies, the combination with a framework and fixed cores, of a mold-box having hinged members; and means for raising and lowering said mold-box vertically.

12. In a machine for molding concrete bodies, the combination with a framework and fixed cores, of a mold-box having hinged members, cores associated with the mold-box, and means for raising and lowering said mold-box vertically.

13. In a machine for molding concrete bodies, the combination with a framework and fixed cores, of a mold-box having hinged members, means for raising and lowering the mold-box, and means associated with the framework for retaining the members in a vertical position when the mold-box is in a lowered position and permitting the members to fold outward when the mold-box is raised.

14. In a machine for molding concrete bodies, the combination with a framework and fixed cores, of a mold-box having movable members and a bottom plate associated with the movable members, and means for raising and lowering the bottom plate.

15. In a machine for molding concrete bodies, the combination with a framework and fixed cores, of a mold-box having movable members and a bottom plate associated with the cores, and means for raising and lowering the bottom plate about the cores.

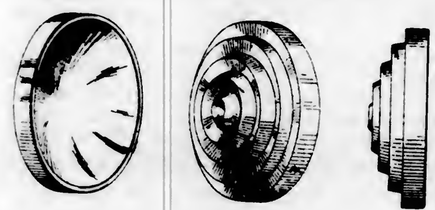
DESIGNS.

37,797. **BADGE.** WILLIAM S. GREEN, Peoria, Ill., assignor to The Brotherhood of Locomotive Firemen, Peoria, Ill., a Fraternal Benefit Association of Illinois. Filed Dec. 16, 1905. Serial No. 292,193. Term of patent 14 years.

37,797.

Claim.—The ornamental design for badge, as shown.

37,798. **REFLECTOR FOR LAMPS.** WILLIAM CHURCHILL, Corning, N. Y. Filed Dec. 5, 1905. Serial No. 290,436. Term of patent 14 years.



Claim.—The ornamental design for a reflector for lamps, as shown.

37,799. **ILLUMINATED CHANDELIER-SIGN.** JOHN L. DAWES, Pittsburg, Pa. Filed Dec. 21, 1905. Serial No. 292,867. Term of patent 3½ years.

Claim.—The ornamental design for an illuminated chandelier-sign, as shown.

37,800. **ILLUMINATED CHANDELIER-SIGN.** JOHN L. DAWES, Pittsburg, Pa. Filed Dec. 21, 1905. Serial No. 292,868. Term of patent 3½ years.

Claim.—The ornamental design for an illuminated chandelier-sign, as shown.

37,801. **ILLUMINATED CHANDELIER-SIGN.** JOHN L. DAWES, Pittsburg, Pa. Filed Dec. 21, 1905. Serial No. 292,869. Term of patent 3½ years.

Claim.—The ornamental design for an illuminated chandelier-sign, as shown.

37,802. **ILLUMINATED CHANDELIER-SIGN.** JOHN L. DAWES, Pittsburg, Pa. Filed Dec. 21, 1905. Serial No. 292,870. Term of patent 3½ years.

87,802.

Claim.—The ornamental design for an illuminated chandelier-sign, as shown.

87,808. SHEET-GLASS. FRANK SEDGMAN, Philadelphia, Pa., assignor to The Continuous Glass Press Company, a Corporation of Pennsylvania. Filed Dec. 18, 1905. Serial No. 292,263. Term of patent 14 years.

Claim.—The ornamental design for sheet-glass as shown.

TRADE-MARKS

PUBLISHED JANUARY 30, 1906.

The following trade-marks have been adjudged entitled to registration under the act of February 20, 1905, and are published in compliance with section 6 of said act. Said section provides:

"Any person who believes he would be damaged by the registration of a mark may oppose the same by filing notice of opposition, stating the grounds therefor, in the Patent Office within thirty days after the publication of the mark sought to be registered, which said notice of opposition shall be verified by the person filing the same before one of the officers mentioned in section two of this act. If no notice of opposition is filed within said time the Commissioner shall issue a certificate of registration therefor, as hereinafter provided for."

Marks which are stated to have been "Used ten years" are registrable under the last proviso of section 5 of said act, which is as follows:

"And provided further, That nothing herein shall prevent the registration of any mark used by the applicant or his predecessors, or by those from whom title to the mark is derived, in commerce with foreign nations or among the several States, or with Indian tribes, which was in actual and exclusive use as a trade-mark of the applicant or his predecessors from whom he derived title for ten years next preceding the passage of this act."

Section 14 of said act provides for the following fee:

"On filing notice of opposition to the registration of a trade-mark, ten dollars."

SER. No. 71. MEDICINES FOR THE REGULATION OF THE LIVER AND PURIFICATION OF THE BLOOD. THE A. H. LEWIS MEDICINE CO., St. Louis, Mo. Filed Apr. 1, 1905.

A rectangular panel having thereon the words, letters, and abbreviations "NATURE'S REMEDY. THE GREATEST LIVER REGULATOR AND BLOOD PURIFIER KNOWN. MANUFACTURED BY THE A. H. LEWIS MEDICINE CO. ST. LOUIS, MISSOURI." and the portrait of Dr. A. H. Lewis in the central portion of said panel and inclosed in a circular frame ornamented by sprays and leaves, with an ornamental scroll extending across the panel, on which appear words indicating the price of treatment, the ingredients of the medicine, and the diseases for which it is used as a remedy.

SER. No. 779. TOILET POWDER. THE STORK COMPANY, Boston, Mass. Filed Apr. 8, 1905.

The word "STORK" and the representation of a stork.

SER. No. 1,302. BAKING-POWDER. JACK FROST BAKING POWDER CO., St. Louis, Mo. Filed Apr. 12, 1905.

37,802.

Claim.—The ornamental design for an illuminated chandelier-sign, as shown.

37,808. SHEET-GLASS. FRANK SHUMAN, Philadelphia, Pa., assignor to The Continuous Glass Press Company, a Corporation of Pennsylvania. Filed Dec. 18, 1905. Serial No. 292,262. Term of patent 14 years.

Claim.—The ornamental design for sheet-glass as shown.

SER. No. 1,311. GRANULATED SMOKING-TOBACCO. THE P. B. PERRY TOB. CO., Reidsville, N. C. Filed Apr. 12, 1905.

GOLD CRUMBS

The words "GOLD CRUMBS" arranged one above the other and separated by a circular panel, on which appears the representation of a bag of tobacco partly opened and the contents spilling therefrom. On the bag appears a label bearing the words "GOLD CRUMBS" and the representation of a circular panel and a bag of tobacco.

SER. No. 1,369. BEER. THE JOHN SCHNEIDER BREWING CO., Covington, Ky. Filed Apr. 13, 1905.

IXL

The letters "I X L."

SER. No. 1,488. LAXATIVE MEDICINES. SAMUEL BRUBAKER HARTMAN, Columbus, Ohio. Filed Apr. 14, 1905.

MANALIN

The word "MANALIN."

SER. No. 1,763. OVERALLS, APRONS, COATS, AND PANTS. CLEVELAND & WESTHILL COMPANY, Newburgh, N. Y. Filed Apr. 15, 1905.

The word "KEYSTONE" and the representation of a keystone.

SER. No. 1,547. LADIES' AND CHILDREN'S HATS. KING, BEERS, HARS MERCANTILE COMPANY, St. Louis, Mo. Filed Apr. 14, 1905. Used ten years.

The representation of a bee and a crown, associated with the word "KING."

SER. No. 1,730. CANNED FRUITS AND VEGETABLES. JAMES M. HOUSTON GROCER COMPANY, St. Louis, Mo. Filed Apr. 15, 1905. Used ten years.

The words "ROSE BUD" and the pictorial representation of a rose and three buds, together with an oblong panel, upon which one of the buds is shown, and several branches and twigs bearing the rose-buds.

SER. No. 1,782. ANVILS. WHITCOMB & HILGER, LIMITED, New York, N. Y. Filed Apr. 15, 1905.

The representation of a horseshoe and the word "AMERICAN" arranged above and the word "WROUGHT" arranged below the horseshoe.

SER. No. 2,062. STOGIES. THE R. & W. JOHNSTON CO., Pittsburg, Pa. Filed Apr. 17, 1905.

SER. No. 2,062.

WINNERS

The arbitrarily-selected word "WINNERS."

SER. No. 2,066. LIQUID COURT-PLASTER. CARPENTER CHEMICAL CO., Detroit, Mich. Filed Apr. 17, 1905.

The representation of a small drum with its upper head broken out and two kittens partially within the same and with their heads and shoulders above the upper rim of the same, together with the words "CAN'T BE BEAT" and a pair of drumsticks.

SER. No. 2,965. FLOUR MADE FROM WHEAT. PILLSBURY-WASHBURN FLOUR MILLS COMPANY, LTD., Minneapolis, Minn. Filed Apr. 25, 1905. Used ten years.

IMPROVED STRAIGHT

The words "IMPROVED STRAIGHT."

SER. No. 2,967. FLOUR MADE FROM WHEAT. PILLSBURY-WASHBURN FLOUR MILLS COMPANY, LTD., Minneapolis, Minn. Filed Apr. 25, 1905. Used ten years.

CARLETON

The word "CARLETON."

SER. No. 2,978. FLOUR MADE FROM WHEAT. PILLSBURY-WASHBURN FLOUR MILLS COMPANY, LTD., Minneapolis, Minn. Filed Apr. 25, 1905. Used ten years.

BEST

The word "BEST," having each letter divided centrally into two parts, the intervening space being occupied by a diamond or square arranged to leave a white margin between the diamond or square and the adjacent portion of the letter.

SER. No. 3,096. DICTIONARIES. G. & C. MERRIAM COMPANY, Springfield, Mass. Filed Apr. 26, 1905. Used ten years.

SER. No. 3,096.

A circle having a wreath eccentrically arranged therein, which inclosse the letters "N" and "W" arranged in a monogram.

SER. No. 3,097. DICTIONARIES. G. & C. MERRIAM COMPANY, Springfield, Mass. Filed Apr. 26, 1905. Used ten years.

The representation of a wreath inclosing the letters "N" and "W" arranged in the form of a monogram.

SER. No. 3,476. WRAPPING-PAPER, PAPER BAGS, AND PAPER SACKS. HOLLINGSWORTH & WHITNEY COMPANY, Boston, Mass. Filed Apr. 26, 1905.

The letters and word "H AND W" arranged as a monogram, the letter "H" being inclined to the line of its base and the letter "W" intertwined therewith.

SER. No. 3,502. WHISKY. SIDNEY F. MILLER, New York, N. Y. Filed Apr. 26, 1905.

PLATO WHISKEY

The words "PLATO WHISKEY," associated with a representation of the head of Plato upon a circular background with ornamental scrollwork at the side.

SER. No. 3,814. WHISKY. MARTIN J. ELSEA, Logansport, Ind. Filed May 1, 1905. Used ten years.

SER. No. 1,211. GRANULATED SMOKING-TOBACCO. THE P. B. PENN TOB. CO., Reidsville, N. C. Filed Apr. 12, 1905.

GOLD CRUMBS

The words "GOLD CRUMBS" arranged one above the other and separated by a circular panel, on which appears the representation of a bag of tobacco partly opened and the contents spilling therefrom. On the bag appears a label bearing the words "GOLD CRUMBS" and the representation of a circular panel and a bag of tobacco.

SER. No. 1,369. BEER. THE JOHN BRENNER BREWING CO., Covington, Ky. Filed Apr. 13, 1905.

IXL

The letters "I X L."

SER. No. 1,433. LAXATIVE MEDICINES. SAMUEL BEUBAKER HARTMAN, Columbus, Ohio. Filed Apr. 14, 1905.

MANALIN

The word "MANALIN."

SER. No. 1,763. OVERALLS, APRONS, COATS, AND PANTS. CLEVELAND & WHITEHILL COMPANY, Newburgh, N. Y. Filed Apr. 15, 1905.

The word "KEYSTONE" and the representation of a keystone.

SER. No. 1,547. LADIES' AND CHILDREN'S HATS. KING, BRING, HAHN MERCANTILE COMPANY, St. Louis, Mo. Filed Apr. 14, 1905. Used ten years.

The representation of a bee and a crown, associated with the word "KING."

SER. No. 1,730. CANNED FRUITS AND VEGETABLES. JAMES M. HOUSTON GROCER COMPANY, St. Louis, Mo. Filed Apr. 15, 1905. Used ten years.

The words "ROSE BUD" and the pictorial representation of a rose and three buds, together with an oblong panel, upon which one of the buds is shown, and several branches and twigs bearing the rose-buds.

SER. No. 1,782. ANVILS. WHEELOCK & HILGER, LIMITED, New York, N. Y. Filed Apr. 15, 1905.

AMERICAN WROUGHT

The representation of a horseshoe and the word "AMERICAN" arranged above and the word "WROUGHT" arranged below the horseshoe.

SER. No. 2,082. STOCKS. THE R. & W. JENKINSON CO., Pittsburg, Pa. Filed Apr. 17, 1905.

SER. No. 2,082.

WINNERS

The arbitrarily-selected word "WINNERS."

SER. No. 2,066. LIQUID COURT-PLASTER. CARPENTER CHEMICAL CO., Detroit, Mich. Filed Apr. 17, 1905.

The representation of a small drum with its upper head broken out and two kittens partially within the same and with their heads and shoulders above the upper rim of the same, together with the words "CAN'T BE BEAT" and a pair of drumsticks.

SER. No. 2,965. FLOUR MADE FROM WHEAT. PILLSBURY-WASHBURN FLOUR MILLS COMPANY, LTD., Minneapolis, Minn. Filed Apr. 25, 1905. Used ten years.

IMPROVED STRAIGHT

The words "IMPROVED STRAIGHT."

SER. No. 2,967. FLOUR MADE FROM WHEAT. PILLSBURY-WASHBURN FLOUR MILLS COMPANY, LTD., Minneapolis, Minn. Filed Apr. 25, 1905. Used ten years.

CARLETON

The word "CARLETON."

SER. No. 2,978. FLOUR MADE FROM WHEAT. PILLSBURY-WASHBURN FLOUR MILLS COMPANY, LTD., Minneapolis, Minn. Filed Apr. 25, 1905. Used ten years.

BEST

The word "BEST," having each letter divided centrally into two parts, the intervening space being occupied by a diamond or square arranged to leave a white margin between the diamond or square and the adjacent portion of the letter.

SER. No. 3,096. DICTIONARIES. G. & C. MERRIAM COMPANY, Springfield, Mass. Filed Apr. 26, 1905. Used ten years.

SER. No. 3,096.

A circle having a wreath eccentrically arranged therein, which incloses the letters "N" and "W" arranged in a monogram.

SER. No. 3,097. DICTIONARIES. G. & C. MERRIAM COMPANY, Springfield, Mass. Filed Apr. 26, 1905. Used ten years.

The representation of a wreath inclosing the letters "N" and "W" arranged in the form of a monogram.

SER. No. 3,476. WRAPPING-PAPER, PAPER BAGS, AND PAPER SACKS. HOLLINGSWORTH & WHITNEY COMPANY, Boston, Mass. Filed Apr. 28, 1905.

The letters and word "H AND W" arranged as a monogram, the letter "H" being inclined to the line of its base and the letter "W" intertwined therewith.

SER. No. 3,502. WHISKY. SIDNEY F. MILLER, New York, N. Y. Filed Apr. 28, 1905.

PLATO WHISKEY

The words "PLATO WHISKEY," associated with a representation of the head of Plato upon a circular background with ornamental scrollwork at the side.

SER. No. 3,814. WHISKY. MARTIN J. BLISH, Logansport, Ind. Filed May 1, 1905. Used ten years.

SER. No. 3,814.

HAND MADE
Woodlawn
SOUR MASH

The words "HAND MADE SOUR MASH," associated with the word "WOODLAWN" ornamented with scrollwork.

SER. No. 3,868. OYSTERS. HAAS BROS., New York, N. Y. Filed May 1, 1906.

BLUE POINT OYSTERS

The words "BLUE POINT OYSTERS," associated with the representation of an oyster-shell containing an oyster and an arrow or spear point arranged obliquely theresecross and having a pennant near the end thereof.

SER. No. 3,877. PLUG-CUT TOBACCO. WEBBERT BROTHERS TOBACCO COMPANY, St. Louis, Mo. Filed May 1, 1906.

ARROW

The word "ARROW" with the representation of a shield having thereon two crossed arrows.

SER. No. 3,887. KID AND LAMB-SKIN GLOVES. STERN BROTHERS, New York, N. Y. Filed May 1, 1906.

LUPIN

The word "LUPIN."

SER. No. 4,104. GELATIN. AMERICAN GLUE CO., Boston, Mass. Filed May 3, 1906. Used ten years.

BOSTON CRYSTAL GELATINE

The words "BOSTON CRYSTAL GELATINE."

SER. No. 4,171. LINIMENT. WILLIAM B. HADLEY, New York, N. Y. Filed May 3, 1906.

WUNDERWURK

The arbitrary word-symbol "WUNDERWURK" in light letters on a dark oblong background.

SER. No. 4,176. BLOUSES, OVERALLS, JUMPERS, TROUSERS, COATS, VESTS, AND WORKINGMEN'S APRONS. LEVI STRAUSS & CO., San Francisco, Cal. Filed May 3, 1906.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

DECISION OF SECRETARY OF THE INTERIOR.

BLACKMORE v. HALL.

Decided January 16, 1906.

1. INTERFERENCE—APPEAL ON MOTION TO DISSOLVE—NON-APPEALABLE QUESTIONS RAISED.

Concerning an appeal taken to the Commissioner from a decision of the Primary Examiner denying a motion to dissolve an interference, *Held* that the appeal to the Commissioner, though alleging the appealable questions of interference in fact and irregularity in declaration, was one attempting to raise by indirection the non-appealable question of an opponent's right to make certain claims.

2. SUPERVISORY AUTHORITY OF SECRETARY OF INTERIOR OVER COMMISSIONER OF PATENTS—DISMISSAL OF APPEAL A QUASI-JUDICIAL DETERMINATION.

Where the Commissioner dismissed an appeal from the decision of the Primary Examiner denying a motion to dissolve an interference on the ground that the appeal, though alleging appealable grounds, only sought consideration of non-appealable questions, *Held* that the decision of the Commissioner was a quasi-judicial determination which bears more or less directly upon the merits of the controversy and presents a question over which the Secretary of the Interior has no supervisory jurisdiction by appeal or otherwise. (See *Butterworth* v. *Hoe*, 112 U. S., 50, and *Poole* v. *Avery*, 14 *Assistant Attorneys-General Opinions*, 177.)

DEPARTMENT OF THE INTERIOR,
OFFICE OF THE ASSISTANT ATTORNEY-GENERAL.
Washington, D. C., January 16, 1906.

The Secretary of the Interior:

SIR: I have your reference of the 5th instant for opinion upon the questions presented by the proffered appeal to the Secretary of the Interior by Henry S. Blackmore from the action of the Commissioner of Patents in dismissing his appeal from the action of the Primary Examiner of the Patent Office denying the said Blackmore's motion to dissolve an interference declared upon his application for Letters Patent for an invention.

It appears that upon the filing of Blackmore's application for Letters Patent of the United States for a new method of producing aluminium, October 29, 1904, it was placed in interference with the application of one Joseph B. Hall, filed November 10, 1902, and that within the time prescribed by the Rules of Practice of the Patent Office Blackmore brought a motion under Rule 122 thereof to dissolve the interference upon the following grounds:

(1) That no interference in fact exists between the applications involved in said interference.

(2) That there has been such irregularity in declaring the interference as would preclude a proper determination of the question of priority.

(3) That the interferant, Hall, has no right to make a claim corresponding to any of the counts of the issue.

(4) That the subject-matter of the interference is not patentable to the party, Hall.

The motion was denied by the Primary Examiner upon all four grounds, and an appeal was taken to the Commissioner upon grounds 1 and 2.

Said Rule 122 provides that motion to dissolve an interference may be made upon any one or all of the four grounds relied upon in this case, and Rule 124 provides that appeal may be taken to the Commissioner from decisions upon all motions, except (1) motions to dissolve which deny the patentability of applicant's claim, and (2) motions which deny the right of the applicant to make the claim.

The decision of the Primary Examiner in denying the motion to dissolve upon the two grounds first mentioned—to wit: (1) that no interference in fact exists, and (2) irregularity in declaring the interference—presents questions which are, under Rule 124 of the Rules of Practice, appealable to the Commissioner of Patents, and that officer, responding to a request of the Secretary of the Interior for report upon this matter, admits so much, but says, in substance and effect, that the only reason assigned by the appellant in support of his first proposition that no interference in fact exists, rests upon the contention that Hall had no right to make a corresponding claim which is declared by Rule 124 to be *not* an appealable issue, and, further, that the claim of irregularity in declaring the interference rests only upon the contention that no interference in fact exists, so that the whole contention rests in its last analysis upon the non-appealable contention that Hall has no right to make a corresponding claim. From an examination of the papers, I am of opinion that this is so, and that Blackmore was attempting by indirection to take an appeal upon a question which is not appealable. The Commissioner so held upon the appeal, and even were I disposed to differ with him upon the merits I should still have to advise you that that decision was a *quasi*-judicial determination which bears more or less directly upon the merits of the controversy and presents a question over which the Secretary of the Interior has no supervisory jurisdiction by appeal or otherwise. (See *Butterworth* v. *Hoe*, 112 U. S., 50, and *Poole* v. *Avery*, 14 *Assistant Attorneys-General Opinions*, 177.)

The appeal should be dismissed.

Very respectfully,

(Signed) FRANK L. CAMPBELL,
Assistant Attorney-General.

Approved: January 16, 1906.

E. A. HITCHCOCK,
Secretary.

REPORT

OF THE

COMMISSIONER OF PATENTS

TO CONGRESS,

FOR THE YEAR ENDED DECEMBER 31, 1905.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., January 25, 1906.

To the Senate and House of Representatives of the United States of America in Congress assembled:

In compliance with section 494 of the Revised Statutes I have the honor to submit the following report of the business of the Patent Office for the year ended December 31, 1905:

RECEIPTS.

Detailed statement of all moneys received for patents, for copies of records or drawings, or from any source whatever.

Applications:		
Cash received		$1,594,762 00
Cash refunded		5,937 00
Net cash		1,588,825 00
Certificates of deposit		37,455 00
Total cash and certificates		1,626,280 00
Copies:		
Cash received		139,815 98
Cash refunded		8,106 74
Net cash		131,709 24
Certificates of deposit		407 56
Total cash and certificates		132,116 80
Recording assignments:		
Cash received		28,490 65
Cash refunded		1,353 13
Net cash		27,137 52
Certificates of deposit		131 00
Total cash and certificates		27,268 52
Subscriptions to Official Gazette:		
Cash received		13,336 72
Cash refunded		127 90
Net cash		13,208 82
Certificates of deposit		42 50
Total cash and certificates		13,251 32
Registration of prints and labels:		
Cash received		9,165 00
Cash refunded		1,383 50
Net cash		7,781 50
Certificates of deposit		60 00
Total cash and certificates		7,841 50
Aggregates.		
Cash received		$1,785,570 35
Cash refunded		16,908 27
Net cash		1,768,662 08
Certificates of deposit		38,096 06
Total cash and certificates		1,806,758 14

EXPENDITURES.

Amounts expended under the several appropriations from January 1, 1905, to December 31, 1905.

Salaries	$853,894 70
Scientific library	1,663 37
Transportation of publications to foreign countries	957 75

Printing and binding, paid Public Printer for Official Gazette, indexes, printing specifications, and miscellaneous work	395,251 38
Total	1,479,633 22

RECEIPTS AND EXPENDITURES.

Receipts from all sources	$1,806,758 14
Expenditures	1,479,633 22
Surplus	327,124 92

Statement of balance in the Treasury of the United States on account of the patent fund.

Amount to the credit of the fund January 1, 1905	$5,863,866 76
Amount of receipts during the year 1905	1,806,758 14
Total	7,670,624 90
Deduct expenditures for the year 1905	1,479,633 22
Balance January 1, 1906	6,190,991 68

SUMMARY OF THE BUSINESS OF THE PATENT OFFICE.

Applications for patents for inventions	54,034
Applications for patents for designs	781
Applications for reissues of patents	156
Total	54,971
Caveats filed	1,896
Applications for registration of trade-marks	16,224
Applications for registration of labels	1,068
Applications for registration of prints	467
Disclaimers filed	5
Appeals on the merits	1,266
Total	20,926
Applications, etc., requiring investigation and action	17,004
Patents issued, including designs	30,270
Patents reissued	129
Total	30,399
Trade-marks registered	4,490
Labels registered	830
Prints registered	359
Total	5,679
Patents expired during the year	19,585
Patents withheld for non-payment of final fees	5,208
Applications allowed awaiting final fees	11,036

The following comparison between the receipts, expenditures, applications filed, issues of the Office, the printed copies sold, copies of records furnished, and the number of employees for the years ended, respectively, December 31, 1899, and December 31, 1905, illustrates the growth of the business of the Patent Office:

Class.	1899.	1905.	Increase.	Per-centage of increase.
Receipts	$1,325,457.03	$1,806,758.14	$481,301.11	36.3
Expenditures	$1,211,783 73	$1,479,633.22	$267,849.49	22.1
Applications and caveats filed	45,990	74,626	28,636	62.2
Letters patent, design and reissue patents granted, and trade-marks, labels, and prints registered	27,787	36,078	8,291	29.8
Printed copies of patents furnished	1,451,519	1,863,367	411,848	28.3
Price received	$50,201.11	$71,738.75	$21,537.64	42.9
Words written in copies of records furnished	13,575,650	21,155,300	7,579,650	55.8
Number of employees	663	748	85	12.8

SUMMARY OF TABLES.

In 1905 there were received 54,034 applications for mechanical patents, 781 applications for design patents, 156 applications for reissues of patents, 16,224 applications for registration of trade-marks, 1,068 applications for registration of labels, and 467 applications for registration of prints. There were 30,270 patents issued, including designs, 129 patents reissued, and 4,490 trade-marks, 830 labels, and 359 prints registered. The number of patents that expired was 19,585. The number of allowed applications awaiting the payment of final fees was 11,036, and the number forfeited for non-payment of the final fees 5,208. The total receipts were $1,806,758.14, the expenditures $1,479,633.22, and the surplus of receipts over expenditures $327,124.92. The total balance to the credit of the Patent Office in the Treasury of the United States on January 1, 1906, was $6,190,991.68.

In proportion to population more patents were issued to citizens of the District of Columbia than to those of any of the States or Territories—1 to every 1,201. Next in order are the following: Connecticut, 1 to every 1,225; Colorado, 1 to every 1,359; California, 1 to every 1,425; New Jersey, 1 to every 1,482; Massachusetts, 1 to every 1,560; Illinois, 1 to every 1,649; New York, 1 to every 1,654; Washington, 1 to every 1,863; Rhode Island, 1 to every 1,871; Ohio, one to every 1,964; Pennsylvania, 1 to every 2,159; Wyoming, 1 to every 2,313; Montana, 1 to every 2,362; Michigan, 1 to every 2,470; Wisconsin, 1 to every 3,253; Oregon, 1 to every 3,256; Missouri, 1 to every 3,280; Iowa, 1 to every 3,366; Minnesota, 1 to every 3,447; Indiana, 1 to every 3,499; Idaho, 1 to every 3,762; Kansas, 1 to every 3,780; Delaware, 1 to every 3,930; North Dakota, 1 to every 3,989; Utah, 1 to every 4,069; Maryland, 1 to every 4,103; Oklahoma, 1 to every 4,105; South Dakota, 1 to every 4,461; Vermont, 1 to every 4,462; New Hampshire, 1 to every 4,473; Nebraska, 1 to every 4,879; West Virginia, 1 to every 5,542; Arizona, 1 to every 5,587; Maine, 1 to every 5,835; Nevada, 1 to every 6,047; Florida, 1 to every 7,660; Texas, 1 to every 7,980; New Mexico, 1 to every 8,491; Louisiana, 1 to every 8,689; Kentucky, 1 to every 8,836; Virginia, 1 to every 9 000, and Georgia, 1 to every 9,894. The fewest pat-

ents granted in proportion to the number of inhabitants were in the following States and Territories: Alaska, 1 to every 63,441; South Carolina, 1 to every 19,147; Mississippi, 1 to every 16,861; Arkansas, 1 to every 14,102; North Carolina, 1 to every 13,431; Alabama, 1 to every 13,253; Hawaii, 1 to every 11,000; Indian Territory, 1 to every 10,887, and Tennessee, 1 to every 10,691.

As to foreign patents, 987 were granted to citizens of Germany; 770 to those of England; 413 to those of Canada; 303 to those of France; 125 to those of Austria-Hungary; 89 to those of Switzerland; 75 to those of Sweden; 72 to those of Scotland; 56 to those of New Zealand; 45 to those of Russia; 40 each to those of Belgium and Italy; 34 to those of New South Wales; 31 to those of Victoria; 30 to those of Denmark; 23 to those of Transvaal; 20 to those of the Netherlands; 19 to those of Ireland; 14 to those of Norway; 13 each to those of Japan and Mexico; 12 to those of Cuba; 10 to those of India; 8 to those of Western Australia; 7 each to those of Argentina and Spain; 5 to those of South Australia; 4 to those of Chile; 3 each to those of Egypt, Natal, and Queensland; 2 each to those of Brazil, Cape Colony, Ceylon, South Africa, and Tasmania; 1 each to those of China, Danish West Indies, Dutch Guiana, Honduras, Isle of Guernsey, Newfoundland, Portugal, and San Salvador.

The condition of the examining divisions upon December 31 is indicated by the fact that of 38 divisions 13 were then taking up amended cases for action within fifteen days from the date of the last amendment, 21 were acting on cases within one month from the date of the last amendment, and the remaining 4 were in arrears between one and two months. The new work was from one to eight months in arrears. The total number of cases awaiting action on the part of the Office upon December 31 was 17,004.

The following table exhibits the claims of losses of cash said to have been transmitted by mail to this Office, covering the last six years. This statement shows a satisfactory reduction in the amount of these claimed losses during the last three years. It is to be noted that within their totals are included those amounts actually lost in the mail, if there were any such:

Year.	Cash received by unregistered mail.	Losses claimed.	
1900	*$8,000.00		$728.40
1901	*8,300.00	First eight months, $387.64; Last four months, 8.00	395.64
1902	*8,500.00		13.30
1903	10,058.71		2.95
1904	9,466.90		3.85
1905	9,147.37		3.20

*Estimated.

The following table shows the entire elimination in the last two years of expenditures of this Office caused by Office errors in the preparation of patents for publication:

Year.	Number of errors paid for.	Annual cost.
1897–98	774	$1,176 48
1898–99	774	1,176 48
1899–00	908	1,380 16
1900–01	717	1,089 84
1901–02	559	842 12
1902–03	476	704 48
1903–04	410	885 16
1904–05	589	557 45
1905–06	539	514 36
1906–07	581	452 02
1907–08	584	500 43
1908–09	713	658 82
1909–1900	682	623 92
1900–1901	727	778 71
1901–1902	665	713 37
1902–1903	520	558 05
1903–1904	178	187 13
1904–1905	(*)	(*)
1905–1906	(*)	(*)

*None that were productive of expense to the Office.

The work of restoration of printed patents to the files of this Office has continued and has resulted in considerable saving of the amounts which would otherwise have been required for reproducing exhausted copies. Reproductions of such exhausted copies of patents are now promptly furnished, and practically all such exhausted copies are reproduced.

The most important event in the business of this Office during the year 1905 was the passage and taking effect of the new trade-mark law of February 20, 1905. This act reduced the fee upon filing an application for trade-mark from twenty-five dollars to ten dollars, and immediately resulted in a great increase in the number of trade-mark applications. The increase may be appreciated by comparing the number of applications received in the year 1905, 16,224, with the number in the preceding year, 2,524, the number filed the past year thus being about six and one-half times the number filed the preceding year. The work thus laid upon this Office in the transaction of this large amount of new business has made it necessary to increase the force employed in the trade-mark division and has laid heavy burdens upon the examining division from which this force was drawn, as well as upon the clerical force drawn upon for the performance of the additional clerical work. To this should be added the increase in the number of applications for patents for the year 1905, such increase being 2,866. The great increase in these two branches of our work has overtaxed the present force of this Office, which is not able to keep this work up to a satisfactory state of promptness under the existing conditions. I consider it a matter of absolute necessity for the prompt and satisfactory transaction of the work of this Office that an increase of force, both of examiners and of clerks, be provided by Congress, and estimates for increases in our force have been submitted for this reason.

An examination of the figures covering receipts, expenditures, and work elements of the operations of this Office for the years 1899 and 1905 discloses an increase in work of about forty per cent., and in this period the increase in the number of employees of the Office is twelve and eight-tenths per cent. Manifestly such growth cannot continue without an increase of force corresponding to the increase of work, and in view of the fact that the general balance from the operations of this Office for the year 1905 amounts to $327,124.92, as shown in the preceding table of receipts and expenditures, I am of opinion that so much of this surplus as is necessary for the purpose should be devoted to increase of force to meet the existing conditions.

The increase of work and of force heretofore referred to calls attention again to the fact that the space allotted to this Office is not sufficient for the satisfactory and economical transaction of its business, and further space is greatly needed and if furnished would result in economy in the operations of this Office.

Respectfully submitted.

FREDERICK I. ALLEN,
Commissioner of Patents.

THE OFFICIAL GAZETTE OF THE United States Patent Office.

Attorneys.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., February 1, 1906.

This Office has been advised by the Secretary of the Interior of the disbarment of the following attorneys from practice before the Department or any Bureau thereof: Marcena M. Murphy, Mount Vernon, Ohio, January 26, 1906; William H. Washington, Beaufort, S. C., January 31, 1906.

C. M. IRELAN,
Chief Clerk.

Drawings.

RULE 38.

38. When there are drawings the description will refer to the different views by figures and to the different parts by letters or numerals (preferably the latter).

RULE 52—EXTRACT.

(6) The different views should be consecutively numbered. Letters and figures of reference must be carefully formed. They should, if possible, measure at least one-eighth of an inch in height, so that they may bear reduction to one twenty-fourth of an inch; and they may be much larger when there is sufficient room. They must be so placed in the close and complex parts of drawings as not to interfere with a thorough comprehension of the same, and therefore should rarely cross or mingle with the lines. When necessarily grouped around a certain part, they should be placed at a little distance, where there is available space, and connected by short broken lines with the parts to which they refer. They must never appear upon shaded surfaces, and when it is difficult to avoid this, a blank space must be left in the shading where the letter occurs, so that it shall appear perfectly distinct and separate from the work. If the same part of an invention appear in more than one view of the drawing it must always be represented by the same character, and the same character must never be used to designate different parts.

It is suggested that numerals or letters be used without exponents.

APPLICATIONS UNDER EXAMINATION

Condition at Close of Business January 30, 1906.

Room No.	Divisions and subjects of invention.	Oldest new application and oldest action by applicant awaiting office action. Amended	New.	No. of applications awaiting action.
	In arrears—Under fifteen days.			
308	XV. Bread, Pastry, and Confections, Making, Coating, Laminated Sheets and Fabrics, Fuel, Glass, Hydraulic Lime and Cement, Paper-Making, Paving, and Plastics.	Jan. 24	Nov. 28	379
154	XI. Boot and Shoe Making, Boots, Shoes, and Leggings, Button, Eyelet, and Rivet Setting, Leather Manufacturing, Nailing and Stapling, Check-Controlled Apparatus, Whips and Whip Apparatus.	Jan. 20	Aug. 26	356
332	X. Carriages and Wagons	Jan. 18	Sept. 26	779
322	XXXVI. Curtains, Shades, and Screens, Drafting, Driers, Measuring Instruments, and Wind-Wheels.	Jan. 17	Dec. 30	214
148	XXXII. Carbonating Beverages, Dispensing Beverages, Dispensing-Cans, Metallic Shipping and Storing Vessels, Packaging Liquids, Paper Receptacles, Refrigeration, Wooden Receptacles.	Jan. 17	Sept. 22	602
321	I. Tillage, etc., Fences, and Railway Draft Appliances.	Jan. 16	Dec. 26	197
276	XXXVIII. Artesian and Oil Wells, Bottles and Jars, Care of Live Stock, Fishing and Trapping, Stationery, Stone-Working.	Jan. 16	Dec. 1	308
244	XXXV. Badges, Buckles, Buttons, and Clasps, Card, Picture, and Sign Exhibiting, Deposit and Collection Receptacles, Package and Article Carriers, Packing and Storing Vessels, Photography.	Jan. 16	Nov. 17	535
303	XVII. Linotyping, Printing, Matrix-Making, Nut and Bolt Locks.	Jan. 16	Nov. 3	336
144	XXIV. Apparel, Apparel Apparatus, Sewing-Machines, Surgery, Toilet.	Jan. 16	Oct. 16	485
175	III. Annealing and Tempering, Coating with Metal, Electro-chemistry, Metal-Founding, Metallurgy, Shaping Fluid Metal.	Jan. 15	Dec. 19	266
304	XXXIV. Railways, Railway-Brakes, Rolling-Stock.	Jan. 15	Dec. 8	356
	Under one month.			
379	XXIII. Acoustics, Coin-Handling, Horology, Recorders, Registers, Optics, Signals, Time Controlling Mechanism.	Jan. 12	Sept. 20	643
318	VI. Bleaching and Dyeing, Chemicals, Explosives, Fertilizers, Medicines, Preserving, Sugar and Salt.	Jan. 10	Nov 7	334
138	XXII. Air-Guns, Ammunition and Explosive Devices, Boats and Buoys, Catapults and Targets, Firearms, Marine Propulsion, Ordnance, Ships.	Jan. 10	Oct. 13	261
106	XXVI. Electricity, Generation, Electric Heaters, Electric Railways, Motive Power.	Jan. 10	July 20	696
107	XXXVII. Electricity, Conductors, Lighting, Special Apparatus.	Jan. 9	May 4	722
128	XIX. Stoves and Furnaces and Steam-Boiler Furnaces.	Jan. 8	July 25	661
179	XXXI. Alcohol, Charcoal and Coke, Distillation, Gas, Heating and Illuminating, Hides, Skins, and Leather, Liquid Coating Compositions, Oils, Fats, and Glue, Water Purification.	Jan. 6	Dec. 13	236
238	II. Bee Culture, Dairy, Label-Affixers, Paper Files and Binders, Presses, Store-Service, Tobacco, etc.	Jan. 6	Nov. 2	215
182	XXX. Fluid-Pressure Regulators, Lamps and Gas-Fittings, Type-Writing Machines.	Jan. 5	May 11	632

Applications Under Examination—Continued.

Room No.	Divisions and subjects of invention.	Oldest new application and oldest action by applicant awaiting office action. Amended	New.	No. of applications awaiting action.
327	XVIII. Steam-Engineering, etc	Jan. 4	Oct. 20	370
137	VIII. Beds, Chairs, Furniture, Kitchen and Table Articles, Store Furniture.	Jan. 4	Sept. 26	530
112	XXI. Textiles, Carding, Knitting, Spinning, Weaving, etc.	Jan. 3	July 15	584
232	IV. Bridges, Conveyers, Cranes and Derricks, Excavating, Hoisting, Hydraulic Engineering, Loading and Unloading, and Towers.	Jan. 2	Dec. 30	273
167	V. Fine Arts, Bookbinding, Harvesters, Jewelry, and Music.	Jan. 2	Dec. 4	368
324	XII. Elevators, Journal-Boxes, Lubricators, Machine Elements, Pulleys and Shafting.	Jan. 2	Oct. 30	427
	Between one and two months.			
307	XIV. Cutting and Punching Sheets and Bars, Farriery, Metal-Bending, Metal-Ornamenting, Metal Personal Wear, Making, Sheet-Metal Ware, Making, Tools, Wire-Working.	Dec. 28	Sept. 14	273
164	XXXIII. Canes, Canopies, Cutlery, Domestic Cooking Vessels, Electricity, Medical and Surgical, Electric Signaling, Fireproof Buildings, Harness, Masonry, Tents, and Umbrellas.	Dec. 26	Aug. 10	751
147	XXIX. Coopering, Roofs, Wheelwright-Machines, Wooden Buildings, Wood-Sawing, Wood-Turning, Woodworking-Tools.	Dec. 23	Oct. 2	340
312	VII. Velocipedes, Clutches, Fire-Escapes, Games and Toys, Ladders, Mechanical Motors, and Paper Manufactures.	Dec. 21	Nov. 1	466
179	XX. Artificial Limbs, Builders' Hardware, Dentistry, Locks and Latches, Safes, Undertaking.	Dec. 21	July 3	344
109	XVI. Telegraphy and Telephony	Dec. 15	Dec. 9	261
382	XXVIII. Air and Gas Engines, Air and Gas Pumps, Pneumatics.	Dec. 13	June 3	954
142	IX. Baths and Closets, Fire-Extinguishers, Hydraulic Motors, Pumps, Sewerage, and Water Distribution.	Dec. 7	June 14	1045
375	XXVII. Brushing and Scrubbing, Grinding and Polishing, Laundry, Washing Apparatus.	Dec. 5	Aug. 3	640
	Between two and three months.			
330	XIII. Arms, Projectiles, and Explosive Charges, Making, Metal-Working, Needle and Pin Making.	Nov. 20	Sept. 5	549
315	XXV. Butchering, Mills, Threshing, and Vegetable Cutters and Crushers.	Nov. 6	Aug. 15	513

Total number of applications awaiting action 17,891

159	TRADE-MARKS, DESIGNS, LABELS AND PRINTS.			
	Between one and two months.			
	Trade-Marks	Dec. 15	Dec. 1	3368
	Under fifteen days.			
	Designs	Jan. 27	Dec. 26	38
	Labels and Prints	Jan. 26	Jan. 26	8

Trade-Marks.

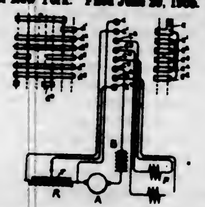
The publication of trade-marks under the act of February 20, 1905, in the OFFICIAL GAZETTE, commenced May 2, 1905, and will appear in each weekly number of the GAZETTE thereafter.

Extra copies of the trade-mark portion of the GAZETTE which will be sold separately, may be obtained single or in quantities for five cents each. Coupons will be taken in payment therefor

PATENTS

GRANTED FEBRUARY 6, 1906.

811,533. CONTROL OF AUTOMOBILE MOTORS. EDWARD H. ANDERSON, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed June 20, 1905. Serial No. 265,510.

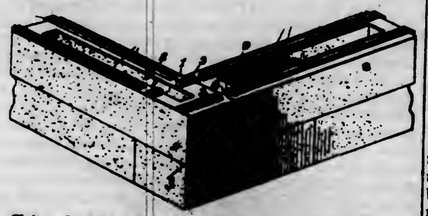


Claim.—1. In a single-motor drive for automobiles, a storage battery, a motor provided with a plurality of field-windings, and a controller having contacts arranged and connected to connect said motor to said battery with the field-windings in series, shunt one of the field-windings, remove said shunted field-winding without breaking the shunt, and then connect the field-windings in parallel.

2. In a single-motor drive for automobiles, a source of current-supply, a motor having two field-windings, a resistance, and a controller having contacts arranged to connect said motor to said source of current-supply with the field-windings in series with each other, then connect said field-windings in parallel with said resistance, then shunt one of said field-windings, then remove said resistance and cut out said latter field-winding without opening the shunt and finally connect the idle field-winding in parallel with the remaining field-winding.

3. In a single-motor drive for automobiles, a source of current-supply, a motor having two field-windings, a resistance, and a controller having a plurality of running positions and contacts arranged to connect said motor to said source of current-supply with its field-windings in series in one position of the controller, to place said resistance in parallel with the field-windings in a second position, to remove said resistance and connect the field-windings in parallel in a third position, and to first place a shunt about one of said field-windings and then disconnect said latter field-winding without breaking the shunt in passing from the second to the third position.

811,534. BUILDING-WALL CONSTRUCTION. WILLIAM M. AKINS and BENJAMIN F. HUDSON, Decatur, Iowa. Filed July 21, 1905. Serial No. 270,722.



Claim.—1. A building-block provided on one face with longitudinally-extending grooves and on its opposite face with longitudinal ribs and transverse ribs spaced from each other and from the longitudinal ribs, and also provided on one side edge with vertical ribs and on one end edge with vertical ribs, the transverse ribs terminating short of the vertical ribs on one side edge of the block, as and for the purpose set forth.

2. A building-block provided on one face with longitudinally-extending grooves and on its opposite face with longitudinal ribs and transverse ribs spaced from each other and from the longitudinal ribs, and also provided on one side edge with vertical ribs and on one end edge with vertical ribs, the transverse ribs terminating short of the vertical ribs on one side edge of the block, and the vertical ribs on the end edge of the block terminating flush with the face thereof and producing an angular formation with the meeting ends of the longitudinal ribs.

3. In a building-wall construction the combination of the corner-block provided in one face with longitudinally-extending grooves and on the opposite face with longitudinal ribs and with transverse ribs spaced from each other and from one end of the longitudinal ribs, said corner-block being also provided on one side edge near one end thereof with vertical ribs in alinement with the transverse ribs and being also provided on one end edge with vertical ribs in alinement with the longitudinal ribs, the transverse ribs terminating short of their alining vertical ribs and the end vertical ribs terminating short of their alining longitudinal ribs and a main wall-block provided with vertical grooves designed to receive the side edge vertical ribs of the corner-block and provided on its opposite end with vertical ribs, said main-wall block being also provided with longitudinal ribs on one face terminating at one end short of said vertical grooves and in alinement therewith and terminating at their other ends short of the outer faces of the vertical ribs of said block, as and for the purpose set forth.

811,535. MEANS FOR MUTING VIBRATIONS IN RAILWAY-RAILS. JOHN ANDERSON, Boston, Mass. Filed May 31, 1904. Serial No. 210,230.

Claim:—1. In a device as described, a compound wholly non-metallic detachable muting-block or damper for railway-rails.

2. In a device as described, a compound, wholly non-metallic detachable muting-block or damper for railway-rails, said muting-block or damper comprising members of different sound-transmitting powers.

3. In a device as described, a compound, wholly non-metallic detachable muting-block or damper for railway-rails, said muting-block or damper comprising separate members of different sound-transmitting powers.

4. In a device as described, a compound, wholly non-metallic mute or damper for railway-rails, said mute comprising separate members of different sound-transmitting powers, said separate members being held in contact with each other by the same clamping means which hold the mute as a whole in contact with the web of the rail.

5. In a means for muting the noise in railway-rails as described, a plurality of compound, wholly non-metallic members applied to the web of the rail, said members being placed on opposite sides of the rail-web and connected in pairs, the members of each pair being connected by two or more attaching means.

6. The combination with a web of a railroad-rail of non-metallic muting means of different degrees of density, and means to clamp said muting means to said rail.

811,586. **INKSTAND.** FRANK M. ASHLEY, New York, N. Y. Filed Oct. 7, 1903. Serial No. 176,265.

Claim.—1. In an inkstand of the class described, the combination with a base portion provided with an annular groove in the bottom thereof, a sealing fluid in said annular groove, a cistern adapted to contain fluid, and a float carrying a dip-tube and dip, the edges of the float adapted to rest in said annular groove, and the dip-tube adapted to project into the said cistern; substantially as described.

2. In an inkstand of the class described, the combination with a base portion provided with an annular groove adapted to contain a sealing fluid, a removable cistern adapted to contain ink, a combined float, and ink-tube, the lower edges of said float adapted to rest in said annular groove and the dip-tube adapted to extend within said cistern.

3. In an inkstand of the class described, a base portion containing a fluid seal, in combination with an ink-cistern resting in said base portion, a combined float and dip-tube, said float inclosing said cistern and being of greater length than the same; substantially as shown and described.

4. In a stand of the class described, the combination of a base portion having a well therein, an ink-cistern adapted to contain ink, said cistern resting in said well by gravity alone, whereby it may be easily removed therefrom, a channel around the bottom of said well containing a heavy normally non-evaporable fluid, and a float having downwardly-extending sides, resting in said fluid, and a downwardly-extending ink-tube adapted to rest in the ink; substantially as described.

5. In an inkstand of the class described, the combination of a base portion having a removable cistern therein, a channel in said body opened at the top, the upper part of which is formed by the inside of said base portion and the outside of said cistern, a heavy normally non-evaporable fluid in the bottom of said channel and a float comprising an ink-tube, which extends downwardly into said cistern and having a dip-funnel on the top thereof, and an exterior wall which extends downwardly into said fluid in said channel; substantially as described.

6. In an inkstand of the class described, the combination with a base portion having a removable cistern therein, a fluid seal in said base portion, and a float adapted to trap a supply of air between said fluid seal and the ink on which said float rests, and means whereby the float will drop when a predetermined amount of ink has been used from said well due to the escape of air from the float whereby its emptiness is indicated; substantially as shown and described.

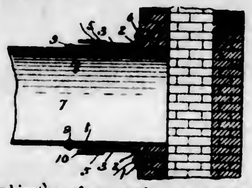
7. In an inkstand of the class described, a base portion containing a heavy normally non-evaporable seal in the base thereof, a removable ink-cistern containing ink resting in said base portion, a float comprising a cylindrical shell carrying a dip cup and tube, air inclosed within said float between said ink and said sealing fluid whereby said float is buoyed up, and by the compression of which, the ink is forced to the dip-cup; substantially as shown and described.

8. In an inkstand of the class described, the combination with a base portion containing a sealing fluid, a removable cistern and a float, said float comprising a dip-tube and side walls, the latter adapted to contact with said sealing fluid, and the dip-tube adapted to project into said cistern; substantially as described.

9. In an inkstand of the class described, the combination with a base portion provided with a groove, a sealing fluid in said groove, a removable cistern adapted to contain fluid, and a float carrying a dip-tube, the edges of the float adapted to rest in said groove and the dip-tube adapted to project into the said cistern; substantially as described.

811,587. **STOVEPIPE-THIMBLE.** HENRY R. AVERSY, Forsyth, Mo. Filed Mar. 10, 1905. Serial No. 249,499.

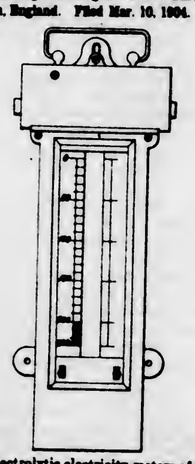
Claim.—1. The combination of an annular flange, provided on its inner edge with an annular bead, and arms extending at right angles from said flange, said arms having cross-slots, said flange adapted to be secured to the wall of the chimney around the stovepipe-hole, and a stovepipe provided with tongues adapted to pass through said cross-slots of the arms of said flange, and thus secure the pipe in the pipe-hole of the chimney, substantially as shown and described, and for the purposes set forth.



2. The combination of an annular stovepipe-flange, provided with arms extending at right angles from the face of said flange, their free ends provided with cross-slots, said flange adapted to be secured to a wall and around a stovepipe-hole, and a stovepipe provided with tongues adapted to pass through said cross-slots of said arms, and thus secure the said pipe in said stovepipe-hole, substantially as shown and described and for the purposes set forth.

3. The combination of an annular flange provided with a series of perforations, and with arms extending at right angles from the face of said flange and provided, near their free ends, with cross-slots; a pipe having at one end longitudinal slits, forming tongues, the tongued end of said pipe slipped through said flange and the tongues engaging said slots, the slitted end of said pipe, and said arms adapted to be thrust into the stovepipe-hole, and said flange to be secured to the wall, substantially as shown and described and for the purposes set forth.

811,588. **ELECTROLYTIC ELECTRICITY-METER.** CHARLES O. BASTIAN, London, England, assignor to The Bastian Meter Company Limited, London, England. Filed Mar. 10, 1904. Serial No. 197,580.

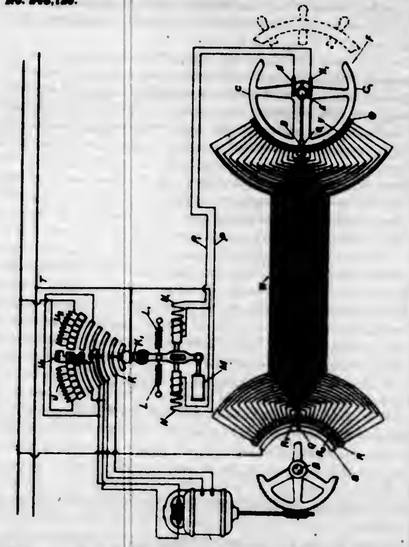


Claim.—1. In electrolytic electricity-meters of the character described, the combination with an electrolyte, of electrodes mounted therein, and a scale supported by the electrodes and arranged to measure the column of the electrolyte, substantially as described.

2. In electrolytic electricity-meters of the character described; the combination with a suitable electrolyte, of electrodes comprising suitably-supported hollow bodies of suitable metal one of which bodies envelops the other body said bodies being secured relatively to one another and spaced apart from one another and connected to the terminals of the meter, and a meter index or scale arranged inside the vessel holding the electrolyte said index or scale being mounted on one of said hollow bodies, substantially as and for the purposes described.

3. In electrolytic electricity-meters of the character described; the combination with a suitable electrolyte, of electrodes comprising cylinders of thin sheet-nickel one of which cylinders envelops the other cylinder said nickel cylinders being of different diameters and being secured concentrically and closely relatively to—but spaced apart from—one another and suitably connected to and supported by nickel conductor-rods which extend above the electrolyte and are connected to the terminals of the meter, and a meter index or scale arranged inside the vessel holding the electrolyte said index or scale being secured to one of said cylinders and to said conductor-rods, substantially as and for the purposes described.

811,589. **ELECTRICAL CONTROL SYSTEM.** RALPH H. BATES, Wilkinsburg, Pa., assignor to Westinghouse Electric & Manufacturing Company, a Corporation of Pennsylvania. Filed Feb. 1, 1905. Serial No. 243,720.



Claim.—1. The combination with a source of electrical energy, a motor, a controlled member operated thereby, and a controller for said motor, of electromagnets for operating said controller, a master-controller comprising a plurality of terminal pieces, and conducting-segments that are respectively connected to the windings of said electromagnets and that are separated and insulated from each other and engage all but one of said terminal pieces, and a controller comprising a plurality of terminal pieces that are respectively connected to the terminal pieces of the master-controller, and means operated by said controlled member for making circuit connections with said terminal pieces, the circuits of the said magnet-windings being interrupted when connection is made with the terminal that is connected with the idle terminal of the aforesaid controller.

2. The combination with a source of electrical energy, a motor, a controlled member operated thereby, and a controller for said motor, of electromagnets for operating said controller, a master-controller comprising a plurality of terminal pieces and conducting-segments that are respectively connected to the windings of said electromagnets and that are separated and insulated from each other and engage all but one of said terminal pieces, and a controller comprising a plurality of terminal pieces that are respectively connected to the terminal pieces of the master-controller, and means operated by said controlled member for making circuit connections with said terminal pieces.

811,540. **GUN-BEARING.** JOHN J. BAYNE, Alexandria, Va. Filed Nov. 29, 1904. Serial No. 234,735.

Claim.—1. In combination with a gun-mount, a gun with trunnions, auxiliary trunnions secured to the gun, ball-bearings, comprising a raceway surrounding said auxiliary trunnions, and elastic supports for said bearings, as set forth.

2. In combination with a gun-mount, a gun with trunnions, auxiliary trunnions secured to the gun, ball-bearings comprising a raceway surrounding said auxiliary trunnions, a yoke secured to said mount and provided with resilient arms for supporting said bearings, as set forth.

3. In combination with a gun-mount, a gun with trunnions, auxiliary trunnions secured to the gun, ball-bearings comprising a raceway surrounding said auxiliary trunnions, a yoke secured to said mount and provided with resilient arms for supporting said bearings, and an adjustable spring carried by said yoke and engaging said bearings, as set forth.

4. In combination with a gun having trunnions, a mount, auxiliary trunnions secured to the gun-trunnions, ball-bearings secured to the auxiliary trunnions, and elastic supports for said bearings, as set forth.

5. In combination with a gun-mount, a gun with trunnions, auxiliary trunnions secured to the gun, ball-bearings comprising raceways therefor, adapted to support the entire weight of the gun, yokes secured to the mount, and having resilient arms, and screws carried by said arms and engaging one of said raceways at each side of the gun, as set forth.

6. In combination with a gun-mount, a gun with trunnions, auxiliary trunnions secured to the gun, ball-bearings adapted to support the weight of the gun, disks forming raceways for said ball-bearings, yokes secured to the mount, and provided with flexible arms, set-screws carried by said arms and engaging one of said raceways at each side of the gun, and an adjustable spring carried by each of said yokes and engaging one of said raceways, as set forth.

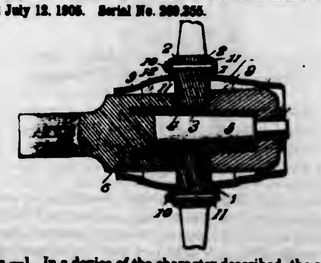
7. In combination with a gun-mount, a gun with trunnions, auxiliary trunnions secured to the gun, ball-bearings comprising raceways surrounding said auxiliary trunnions, yokes secured to the mount and provided with resilient arms, set-screws carried by said arms and each engaging a raceway at each trunnion, a set-screw carried by each yoke intermediate its flexible arms, and a spring at each side of the gun secured to a raceway and supported by the set-screw intermediate said flexible arms, as set forth.

8. In combination with a gun and carriage therefor, trunnions upon said gun, a pair of bearing-disks at each trunnion, one of each pair being secured to its adjacent trunnion, balls between said bearing-disks, yokes secured to said carriage and provided with flexible arms, and set-screws carried by said arms and engaging a bearing-disk at each trunnion, as set forth.

9. In combination with a gun and carriage therefor, trunnions upon said gun, a pair of bearing-disks at each trunnion, one of each pair having a threaded shank portion engaging a threaded aperture in its adjacent trunnion, ball-bearings intermediate said bearing-disks, yokes having flexible arms, set-screws carried by said arms and engaging one of each pair of said bearing-disks at positions diametrically opposite, as set forth.

10. In combination with a gun and carriage therefor, trunnions upon said gun, a pair of bearing-disks at each trunnion, one of each pair having a threaded shank portion engaging a threaded aperture in its adjacent trunnion, ball-bearings intermediate said bearing-disks, yokes having flexible arms, set-screws carried by said arms and engaging one of each pair of said bearing-disks at positions diametrically opposite, a spring held yieldingly against one of each pair of said disks, and a set-screw supporting each spring, as set forth.

811,541. **HUB AND SPINDLE.** JACOB BOATRIGHT, Joplin, Mo. Filed July 12, 1905. Serial No. 269,265.



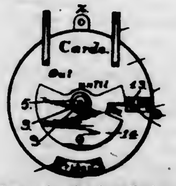
Claim.—1. In a device of the character described, the combination of a spoke-receiving disk, reinforcing-plates upon each side thereof, a tubular member passing through the spoke-receiving disk and projecting outwardly on both sides thereof, an axle-spindle passing through the tubular member, a cup-shaped bearing formed into-

gral upon the inner end of the spindle, and a similar cup-shaped member removably mounted upon the outer end of the spindle, said cup-shaped bearings embracing the projecting ends of the tubular member and fitting against the reinforcing-plates upon opposite sides of the spoke-receiving disk.

2. In a device of the character described, the combination of a spoke-receiving member, reinforcing-plates upon each side thereof, a tubular member passing through the spoke-receiving member and projecting outwardly on both sides thereof, a spindle passing through the tubular member, cup-shaped bearings mounted upon the spindle and embracing the projecting ends of the tubular member, and a casing secured upon each side of the spoke-receiving member, said casings projecting over the bearings and being spaced therefrom.

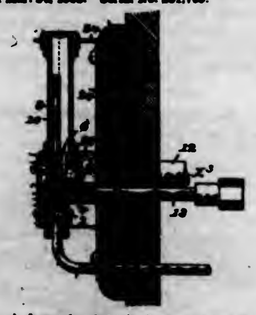
3. In a device of the character described, the combination of a spoke-receiving member, reinforcing-plates upon each side thereof, a tubular member passing through the spoke-receiving member and projecting outwardly on both sides thereof, a spindle passing through the tubular member, cup-shaped bearings mounted upon the spindle and embracing the projecting ends of the tubular member, and a casing secured upon each side of the spoke-receiving member and projecting outwardly over the bearings, and fastening members passing through the spoke-receiving member, reinforcing-plates, and casings.

811,542. INDICATOR. PRESCOTT S. BUCKINGHAM, Hayworth, Cal. Filed Mar. 27, 1905. Serial No. 252,266.



Claim.—In an indicator for the described purpose, the combination with an outer casing, of a day-disk rotatably held therein, a spindle to which the disk is secured; a quarter-hour plate superimposed on the day-disk and loosely mounted upon the spindle, an hour-disk rotatably held within the casing above the quarter-hour plate, a sleeve projecting from the hour-disk loosely fitting the spindle of the day-disk, a face-plate fitted to the casing and having on the face thereof lettering indicative of the information to be given, said face-plate having sight-openings therein for exposing to view the printed matter of the rotatable disks and quarter-hour plate, a spring-held swinging cover-plate movable on the face-plate, and a finger-piece extending from the quarter-hour plate through a slotted portion of the casing's circular wall.

811,548. FOUNTAIN SIGHT-FEED. HARRY J. CARLE, Chicago, Ill. Filed Mar. 24, 1905. Serial No. 251,769.



Claim.—1. A fountain sight-feed, comprising in combination, a trunk formed with an inlet-passage, duplicate end outlet passages intersecting the inlet-passage and a return-passage adjacent to one of said outlet-passages, a sight-feed tube communicating with the return and outlet passages aforesaid, a discharge-nozzle in said sight-tube communicating with the outlet-passage aforesaid, and a semirotary valve arranged at the intersection of the inlet and outlet passages and adapted to control the direction of the flow of fluid through the same, substantially as set forth.

2. A fountain sight-feed comprising in combination, a trunk formed with a horizontal inlet-passage, vertical upper and lower outlet-passages intersecting said horizontal passage and a return-passage arranged adjacent to said upper vertical passage, a sight-tube attached to the trunk with its interior in communication with said upper vertical and return passages, a semirotary valve arranged at the intersection of said vertical and horizontal passages and having an angular port adapted to successively register said passages, and control the direction of the flow of fluid through the same, substantially as set forth.

3. A fountain sight-feed comprising in combination, a trunk formed with a horizontal inlet-passage, vertical upper and lower outlet-passages intersecting said horizontal passage and a return-passage arranged adjacent to said upper vertical passage, a sight-tube attached to the trunk with its interior in communication with said upper vertical and return passages, a discharge-nozzle arranged within the sight-tube and communicating with said upper vertical passage, a semirotary valve arranged at the intersection of said vertical and horizontal passages and having an angular port adapted to successively register said passages, and control the direction of the flow of fluid through the same, substantially as set forth.

4. A fountain sight-feed, comprising in combination, a trunk formed with a series of inlet-passages, duplicate series of outlet-passages intersecting the series of inlet-passages, a series of return-passages adjacent to one series of outlet-passages and a longitudinal passage common to the series of return-passages, a series of sight-tubes communicating with the series of outlet and return passages aforesaid, and a semirotary valve arranged at the intersectoin of inlet and outlet passages and adapted to control the direction of the flow of fluid through said series of passages, substantially as set forth.

5. A fountain sight-feed, comprising in combination, a trunk formed with a series of inlet-passages, duplicate series of outlet-passages intersecting the series of inlet-passages, a series of return-passages adjacent to one series of outlet-passages and a longitudinal passage common to the series of return-passages, a series of sight-tubes communicating with the series of outlet and return passages aforesaid, a series of discharge-nozzles in said sight-tubes communicating with one series of outlet-passages, and a semirotary valve arranged at the intersection of the inlet and outlet passages and adapted to control the direction of the flow of fluid through said passages, substantially as set forth.

6. A fountain sight-feed, comprising in combination, a trunk formed with a series of horizontal inlet-passages, a series of vertical upper and lower outlet-passages intersecting the series of horizontal passages, a series of return-passages arranged adjacent to the series of upper vertical passages, and a longitudinal passage common to the series of return-passages, a series of sight-tubes attached to the trunk with their interiors in communication with said upper vertical and return passages, a semirotary valve arranged at the intersection of said vertical and horizontal passages and having a series of angular ports adapted to successively register said passages, and control the direction of the flow of fluid through the same, substantially as set forth.

7. A fountain sight-feed, comprising in combination, a trunk formed with a series of horizontal inlet-passages, a series of vertical upper and lower outlet-passages intersecting the series of horizontal passages, a series of return-passages arranged adjacent to the series of upper vertical passages, and a longitudinal passage common to the series of return-passages, a series of sight-tubes attached to the trunk with their interiors in communication with said upper vertical and return passages, a series of discharge-nozzles arranged within the sight-tubes and communicating with the upper series of vertical passages, a semirotary valve arranged at the intersection of said vertical and horizontal passages and having a series of angular ports adapted to successively register said passages and control the direction of the flow of fluid through the same, substantially as set forth.

8. A fountain sight-feed, comprising in combination, a trunk formed with an inlet-passage, duplicate outlet-passages intersecting the inlet-passage and a return-passage adjacent to one of said outlet-passages, a sight-feed tube communicating with the return and outlet passages aforesaid, a semirotary valve arranged at the intersection of the inlet and outlet passages and provided with angularly-arranged faces in a portion of its circumference, and a spring-follower adapted to engage such faces, substantially as set forth.

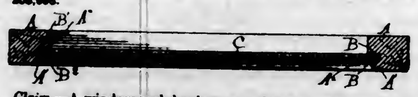
9. A fountain sight-feed, comprising in combination, a trunk formed with a series of inlet-passages, duplicate series of outlet-passages intersecting the series of inlet-passages, a series of return-passages adjacent to one series of outlet-passages and a longitudinal passage common to the series of return-passages, a series of sight-

tubes communicating with the series of outlet and return passages aforesaid, a semirotary valve arranged at the intersection of the inlet and outlet passages and provided with angularly-arranged faces in a portion of its circumference, and a spring-follower adapted to engage said surfaces, substantially as set forth.

10. A fountain sight-feed, comprising in combination, a trunk formed with a series of inlet-passages, duplicate series of outlet-passages, intersecting the series of inlet-passages, a series of return-passages adjacent to one series of outlet-passages and a longitudinal passage common to the series of return-passages, a series of sight-tubes communicating with the series of outlet and return passages aforesaid, a semirotary valve arranged at the intersection of the inlet and outlet passages and adapted to control the direction of the flow of fluid through said series of passages, and an angle-plate secured to the front of the trunk, and provided with a series of orifices in its upper flange to receive the base of the sight-tubes, substantially as set forth.

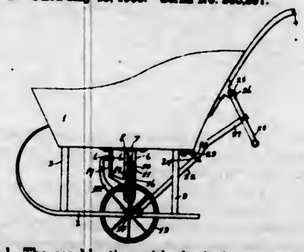
11. A fountain sight-feed, comprising in combination, a trunk formed with a series of inlet-passages, duplicate series of outlet-passages intersecting the series of inlet-passages, a series of return-passages adjacent to one series of outlet-passages and a longitudinal passage common to the series of return-passages, a series of sight-tubes communicating with the series of outlet and return passages aforesaid, a semirotary valve arranged at the intersection of the inlet and outlet passages and adapted to control the direction of the flow of fluid through said series of passages, and an angle-plate having a horizontal upper flange provided with a series of orifices to receive the upper ends of the sight-tubes, substantially as set forth.

811,544. GLASS-RETAINING DEVICE FOR SASHES. CHRISTOPHER C. CHARCEY, Hartford, Ala. Filed Apr. 3, 1905. Serial No. 253,606.



Claim.—A window-sash having an undercut groove for the reception of putty, B, behind the glass, C, under the lip portion A' of the sash, A, substantially in the manner and for the purposes, hereinbefore described and set forth.

811,545. TRUCK ATTACHMENT FOR SLEIGHS. JOHN M. CLOSSON, Hoosick Falls, N. Y., assignor of one-half to Bernard McCusker, Troy, N. Y. Filed May 15, 1905. Serial No. 260,207.



Claim.—1. The combination with the body and runners of a sleigh; of a brace mounted upon, and depending from, the under side of the sleigh-body; a truck-frame pivotally mounted upon the under side of the sleigh-body comprising in part an angle-lever having one end adapted to swing into and out of engagement with said brace, one of said engaging members being formed with a recess adapted to receive and fit the other; and a wheel mounted upon the other end of said angle-lever.

2. The combination with the body and runners of a sleigh; of a hanger attached to the bottom of the sleigh-body, said hanger having a depending brace; a truck-frame bracket in the form of an angle-lever pivotally connected with said hanger, and having one end adapted to swing into and out of engagement with and to receive and fit said brace; and a wheel mounted upon the other end of said lever.

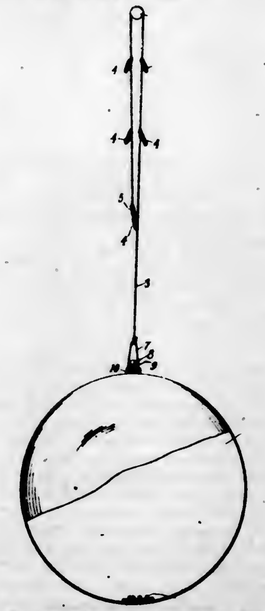
3. The combination with the body and runners of a sleigh; of a pair of hangers attached to the bottom of the sleigh-body in line with each other transversely thereof, each having a depending brace; a pair of truck-frame brackets each in the form of an angle-lever pivotally connected with the respective hangers, and each having one end adapted to swing into and out of engagement with, and to receive and fit the brace on its respective hanger; a shaft or axle mounted in the other ends of said bracket-levers; and wheels mounted upon said shaft or axle.

4. The combination with the body and runners of a sleigh; of a hanger mounted upon the under side of the sleigh-body; a truck-frame having a wheel mounted thereon; a pivotal connection between the truck-frame and hanger; and means for fixedly mounting said pivotal connection upon the hanger in different positions of adjustment and means for swinging said truck-frame into and out of operative position in different positions of adjustment of said pivotal connection.

5. The combination with the body and runners of a sleigh; of a vertically-slotted hanger mounted upon the under side of the sleigh-body; a pivot-block adjustable longitudinally of the slot in the hanger; a truck-frame pivotally connected with said pivot-block; and a wheel mounted upon said truck-frame.

6. The combination with the body and runners of a sleigh; of a vertically-slotted hanger having a vertically-extended brace mounted upon the under side of the sleigh-body; a pivot-block adjustable longitudinally of the slot in the hanger; a truck-frame pivotally connected with said pivot-block and comprising in part an angle-lever having one end thereof adapted to receive and fit said brace in different positions of adjustment of said pivot-block; and a wheel mounted upon the other end of said lever.

811,546. PUNCHING-BAG. PATRICK J. CONROY, New York, N. Y. Filed Feb. 11, 1905. Serial No. 245,188.



Claim.—1. In a punching-bag, a thin highly-expansible body, an air-valve connected with said body, and weighting material loosely disposed in said body, substantially as described.

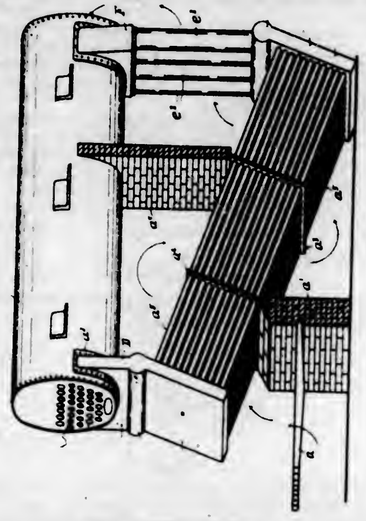
2. In a punching-bag, a thin highly-expansible body, an air-valve connected with said body, an apportionable weighting material loosely disposed in said body, substantially as described.

3. In a punching-bag, a thin highly-expansible body, an air-valve connected with said body, weighting material loosely disposed in said body, an elastic coupling, a suspender having a plurality of loops, and means for connecting the free end of said suspender to any one of the loops thereon, substantially as described.

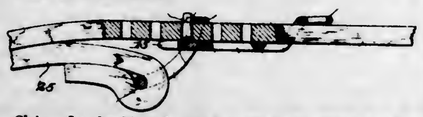
811,547. TUBULAR BOILER. FRANK P. COOPER, Cincinnati, Ohio. Filed Dec. 22, 1904. Serial No. 237,886.

Claim.—In a tubular boiler the combination of a horizontal cylindrical shell with tubes extending therethrough and slots in its

ends, a series of inclined tubes, headers at the upper and lower ends of the tubes each consisting of a rectangular chamber surmounted by a cylindrical chamber, the front cylindrical chamber having a slot in its upper surface and the rear cylindrical chamber having a series of openings in its upper surface, a front cross-box secured over the forward slot in the shell, and over the slot in the cylindrical chamber, the rear cross-box secured over the rear slot in the shell and having a series of openings in its lower wall, and a series of vertical pipes secured in the openings of the rear cross-box and the rear cylindrical chamber.



811,548. BUCKLE. JOHN J. CREEDON, Moline, Ill. Filed July 31, 1905. Serial No. 272,006.



Claim.—In a buckle and trace, a frame having spaced side bars connected by end bars one of which is provided with a central rearwardly-extending lug having a flat bearing-surface and defining oppositely-disposed recesses the walls of which are curved, a vertically-disposed tongue spaced from the free end of the lug and adapted to engage one of the openings in the trace, a tug-bail extending through an opening in the frame and embracing the trace and having a cross-bar resting on the trace and provided in one edge thereof with a centrally-disposed recess for the reception of the tongue, and curved arms carried by the tug-bail and adapted to engage the curved walls of the recesses, whereby the trace will be securely clamped between the cross-bar and the flat bearing-surface at the free end of the rearwardly-extending lug.

811,549. VEHICLE-WRENCH. ANDREW DEPPENBAUER, Louisville, Ohio. Filed June 2, 1905. Serial No. 263,466.

Claim.—1. A device of the character described, comprising a body portion, hooks secured to said body portion at right angles to each other, and nut-clamping means carried by said body portion.

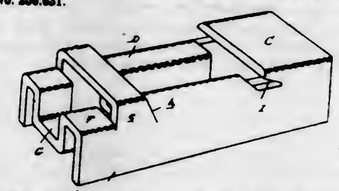
2. A device of the character described, comprising a resilient bar twisted intermediate its ends, hooks secured to said bar at right angles to each other, a fixed jaw carried by said bar, an adjustable jaw secured to said bar, and means for securing said adjustable jaw in a stationary position.

3. In a device of the character described, the combination of a resilient bar, said bar provided near one end with a portion extending at right angles to the body of the same, the ends of said bar bent over at right angles to the body, hooks secured to said bar and engaging the right-angled bent-over portions thereof, said hooks positioned at right angles to each other, a jaw fixedly secured to said bar, a removable threaded bolt secured in a stationary position upon said bar, said bolt provided with a head, an adjustable jaw provided with an elongated slot positioned upon said bar, said bolt engaging the slotted portion of said jaw, said adjustable jaw provided with parallel lips, constituting guides, and an adjustable locking-lever positioned upon the threaded portion of the bolt, said locking-lever comprising an apertured body portion, and an angular, integral arm extending therefrom.

4. A wrench, comprising a body portion, said body portion provided with angular, integral end portions, hooks secured to said bar and engaging said angular end portions, said hooks positioned at right angles to each other, a fixed and an adjustable jaw secured to said body portion, and stationary locking means engaging said adjustable jaw for securing the same in a fixed position.

5. A wrench comprising a body provided with a portion positioned at right angles to the main portion of said body, hooks carried by said body at substantially right angles to each other, one of said hooks carried by said portion of the body positioned at right angles to the main part thereof, and clamping means carried by said body.

811,550. RAILWAY-RAIL STAY. JAMES DONOVAN, Three Rivers, Mich., assignor, by mesne assignments, to Sheffield Car Company, Three Rivers, Mich., a Corporation of Michigan. Filed Apr. 20, 1905. Serial No. 256,631.



Claim.—1. In a railway-rail stay, the combination of a block having a seat for the rail-base, and a wedge passing lengthwise of the block for clamping the block to the rail.

2. In a railway-rail stay, the combination of a block having a seat for the rail-base, an overhanging hook at one side of the seat, and a wedge-bearing at the other side thereof and a wedge adapted to engage the bearing transverse to the rail and to clamp the block to the rail.

3. In a railway-rail stay, the combination of a block having a seat for a rail-base, a hook at one side of the seat, a cross-bar at the other side, and a wedge adapted to engage under the cross-bar and over the rail-base transverse to the rail.

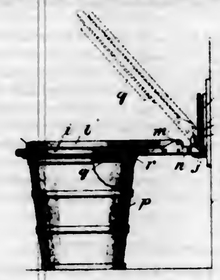
4. In a railway-rail stay, the combination of a block having a seat for a rail-base, a hook at one side of the seat, a cross-bar at the other side having the inclined side h, and a wedge adapted to engage under the cross-bar and over the rail-base.

5. A railway-rail stay made of sheet metal, shaped to form a rail-seat, the hook at one side thereof, the cross-bars E and F at the other side, and the depressed portion G in the cross-bar F.

6. A railway-rail stay made of sheet metal comprising the sides B, a rail-seat D, the hook C at one side thereof, and the cross-bars E and F at the other side thereof.

811,551. ADJUSTABLE SEAT FOR WATER-CLOSETS. WILLIAM L. DOUD, Manila, Philippine Islands. Filed Aug. 30, 1904. Serial No. 223,251.

Claim.—1. In an adjustable water-closet seat, the combination of supporting-brackets each provided with a long slot and a short slot, a seat provided with two sets of pins adapted to engage said long slots and said short slots respectively, a cover pivotally mounted on said seat, means for providing an air-tight joint between said cover and said seat, a receptacle and means for providing an air-tight joint between said seat and said receptacle, substantially as described.



2. In an adjustable water-closet seat, the combination of a support, brackets secured thereto each provided with a long slot and a short slot respectively, said slots having their upper ends open, a seat provided with two sets of pins adapted to engage with said long slots and said short slots respectively, a cover pivotally mounted on said seat, a washer between said cover and said seat and washer and a circular projection on the under side of said seat and a receptacle the top of which is adapted to engage with said circular projection, substantially as described.

811,552. PROCESS OF MAKING HYDRATED OXID OF LEAD. JAMES H. BARDEN, New York, N. Y., and CARLETON ELLIS, Boston, Mass., assignors, by mesne assignments, of one-third to Sawyer, Foster and Hardy, Boston, Mass., a Firm. Filed Mar. 14, 1904. Serial No. 198,013.

Claim.—1. Process for making hydrated oxid of lead which consists in the electrolysis, with lead anodes, of hot aqueous solutions of purified brine; in mingling the products of said electrolysis; and in separating the so-formed hydrated oxid of lead.

2. Process for making hydrated oxid of lead which consists in the electrolysis, with lead anodes, of hot concentrated solutions of sodium chlorid; in mingling the anolyte and catholyte; in removing from the electrolyte the insoluble lead compounds thereby formed; and in returning the said electrolyte to the electrolytic cell.

3. Process for making hydrated oxid of lead which consists in the electrolysis, with lead anodes, of hot aqueous solutions of sodium chlorid; in mingling the anolyte and catholyte; in separating from the electrolyte the so-formed hydroxid of lead; and in bringing the said electrolyte again into the region of electrolytic action.

4. Process for the continuous production of hydrated oxid of lead which consists in the electrolysis, with lead anodes, of a hot aqueous solution of sodium chlorid; in commingling the anolyte and catholyte to produce hydrated oxid of lead and to re-form the original electrolyte; in removing therefrom the insoluble lead compounds; and in again subjecting the said electrolyte to aforesaid electrolysis.

811,553. GARMENT-SUPPORTER. ROBERT H. RUBY, Batavia, Iowa. Filed May 20, 1905. Serial No. 261,546.

Claim.—1. In garment-supporters a wire member having its ends bent into parallel U-shaped hooks and its center formed at right angles to the stem of said hooks, and a U-shaped plate member having means on its rear side to support the central portion of the hook member and recesses formed on its front side for the insertion of the points of the hooks.

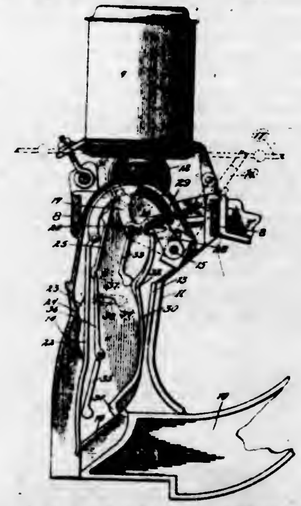
2. In garment-supporters, a member having parallel hooks, a central portion disposed at substantially right angles to the stem of the hooks, the corners connecting the stems of the hooks and the central portion being bent so as to bring the central portion in toward the center of the hook, and a U-shaped plate member having means on its rear side to support the central portion of the hook member and recesses formed on its front side for the insertion of the points of the hooks.

3. In a garment-supporter, a plate member bent in the shape of an inverted U, a tongue formed on the inner face of the rear side of the plate, and the edges of the front side of the plate folded so as to form vertically-set cylindrical-shaped recesses on its front side, and a hooked member having its lower end adapted to slide under the tongue and to rest upon its base, and its upper or hooked ends to catch over the top of the plate and the points of the hooks to rest in the recesses.

4. In a garment-support, a plate member bent in the shape of an inverted U, a tongue cut out of and joined at its lower end to the rear side of the plate and the edges of the front side of the plate folded so as to form vertically-set tubular-shaped recesses on its front side, and a hooked member having its lower end adapted to slide under the tongue and to rest upon its base, and its upper or hooked ends to catch over the top of the plate and the points of the hooks to rest in the recesses.

5. The combination of a hooked wire member having its central portion set at an angle to the stems of the hooks, and the corners joining said central portion and the stems together extended out laterally; a U-shaped plate member having a tongue on its rear side and recesses on its front side, and said corners of the wire member adapted to slip over the rear side of the plate member and its central portion to catch under the tongue thereon, and the hooked ends to catch over the top of the plate member and insert in the recesses.

811,554. CORN-PLANTER. ERNST E. ENGLUND, Moline, Ill., assignor to D. M. Sechler Carriage Company, Moline, Ill., a Corporation of Illinois. Filed Sept. 13, 1905. Serial No. 278,284.



Claim.—1. In a corn-planter, the combination with check-rower mechanism, a seedbox and a hollow runner-shank, of an opening between said seedbox and the top of said runner-shank, an upper valve controlling said opening and forming an upper closure, a shelf opening to the heel of said runner-shank, a plunger adapted to move along said shelf and discharge seed therefrom to the ground, an opening above said shelf adapted to be closed by said plunger to form an intermediate closure, a valve-plate adapted to close against said shelf to form a bottom closure, and connections between said check-rower devices and said upper valve and said valve-plate and said plunger whereby when said upper and lower closures are opened by the action of the check-rower mechanism the plunger will close said intermediate closure and force the seed from the shelf and when said upper and lower closures are closed said intermediate closure will be open.

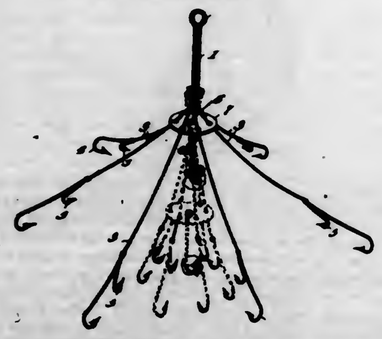
2. In a corn-planter, the combination with a hollow runner-shank, a sloping shelf at the heel of the runner, and an opening for the passage of seed at the top of the shank, of a valve adapted when operated to alternately open and close said opening, check-rower mechanism connected with said valve, a plate pivotally connected at its upper end with said valve and having a plunger-head at its lower end adapted to move back and forth on said shelf when said check-

rower mechanism is operated, an intermediate closure above said plate adapted to be closed by said plunger when moved to discharge the seed, and a valve-plate pivotally connected at its upper end with said valve and adapted to close against said shelf when said plunger is moved and to be lifted therefrom when said plunger moves along said shelf to discharge the seed, substantially as described.

3. In a corn-planter, the combination with a hollow runner-shank, a sloping shelf at the heel of the runner, and an opening for the passage of seed at the top of the shank, of a rocking valve adapted to swing past said opening and to alternately open and close the same when operated, check-rower mechanism connected with said rocking valve, a cam-plate pivotally connected at its upper end with said rocking valve and having a plunger-head at its lower end, a bearing in said shank adapted to bear upon said cam-plate and cause said plunger-head to slide back and forth along said shelf when the check-rower mechanism is operated, a series of plates extending across the opening in said runner from side to side to form a rear wall for the said tube and having the lower plate at a distance above said shelf adapted to be closed by said plunger, when moved to discharge the seed, to form an intermediate closure, a cam-plate pivotally connected at its upper end with said rocking valve, and a bearing on said runner-shank adapted to bear against said cam-plate and close the lower end of the same against said shelf to form a lower closure when said check-rowing devices are in their normal position, substantially as described.

4. In a corn-planter, the combination with a hollow runner-shank, a sloping shelf at the heel of the runner, an opening at the top of said runner-shank for the passage of seed, and check-rower mechanism, of a rocking valve pivoted in said runner-shank and adapted to swing past said opening to alternately open and close the same as said check-rower devices are operated, a plunger pivotally connected at its upper end to said rocking valve and adapted to slide back and forth on said plate as said check-rower mechanism is operated, a valve-plate pivotally connected at its upper end with said rocking valve and adapted to close against the end of said sloping shelf when said check-rower mechanism is in its normal position, a fixed plate 35 having a space between its lower end and said shelf adapted to be closed by said plunger when moved downward to discharge the seed, fixed plates 25 and 33 located in the upper part of said runner-shank with a space between them in the line of said discharge-opening, and a swinging plate 36 adapted to be rocked back against the lower end of the plate 25 or forward against the lower end of plate 33, substantially as described.

811,555. FISHING DEVICE. WILLIAM S. FREES, Bay City, Mich. Filed Aug. 15, 1905. Serial No. 274,894.



Claim.—1. In a device of the class described, the combination of a plurality of normally spaced apart hooks, bait-supporting means between said hooks, and a hydroplane arranged to force the hooks together when the device is pulled through water.

2. In a device of the class described, the combination of a plurality of spring-shanks normally spaced apart, hooks carried by said shanks, bait-supporting means between said hooks, and a hydroplane movable relatively to the shanks and arranged to force the same together as the device is given a sharp jerk when in water.

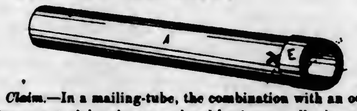
3. In a fish-trap, the combination of a plurality of spring-shanks normally arranged in diverging positions, an actuating member connected with the shanks to force the same together, hooks carried by the shanks, and a bait-hook connected with the actuating member and normally arranged in the space about which the several shanks are arranged.

4. In a fish-trap, the combination of a main shank, a plurality of shanks diverging from the main shank, and normally spaced apart by spring action, hooks carried by the diverging shanks, bait-supporting means arranged in the space about which the diverging shanks are disposed, and an actuating member supported by the diverging shanks and adapted by movement thereon to force the same together.

5. In a fish-trap, the combination of a plurality of shanks intertwisted at one end to form a main shank provided with an eye for attachment to the line, the plurality of shanks normally retaining divergent positions by spring action, and a plurality of hooks carried by the several shanks projected from the main shank, an actuating member slidable longitudinally on the plurality of divergent shanks, and a bait-hook connected with said actuating member.

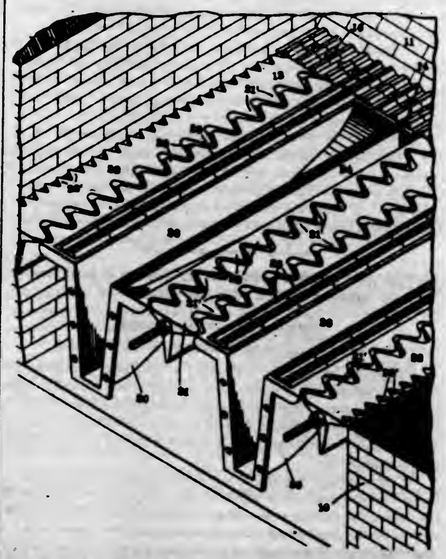
6. In a device of the class described, the combination of a plurality of normally spaced apart hooks, and a hydroplane operably connected with said hooks to force the same together when the device is pulled sharply through water.

811,556. MAILING-TUBE. ALONZO L. GRAY, Vanderbilt, Pa. Filed July 3, 1905. Serial No. 268,066.



Claim.—In a mailing-tube, the combination with an outer tube of strong material and a paper band having an adhesive surface on one end thereof, of an inner tube of weaker material, having a cleft through its whole length, pierced with opposite perforations one on each side of said cleft near one end thereof, said inner tube being arranged to carry mail-matter and to slip into and out of said outer tube, a cord, drawn through said perforations folding on said outer tube, detachably fastened thereon by said adhesive band, holding said inner tube in position in said outer tube, and when torn away from said band affording facility for withdrawing said inner tube from within said outer tube.

811,557. FURNACE. SYLVESTER P. GREY, Indianapolis, Ind., assignor to Machinery Exchange, Indianapolis, Ind., a Copartnership. Filed Oct. 3, 1904. Serial No. 227,026.



Claim.—1. In a furnace, the combination with an open-top fuel-chute, of a pair of air-passages arranged one upon each side of said fuel-chute and provided with perforated removable but normally stationary fuel-receiving caps, means for supplying a blast of air to said passages, and a rocking grate-bar flanking each of said air-passages.

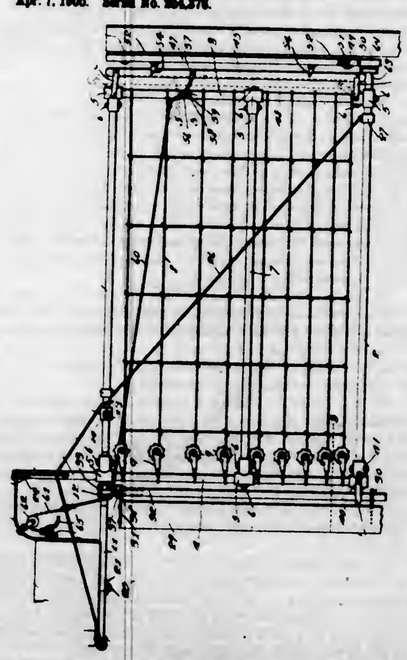
2. In a furnace, the combination, with a transverse air-trunk, of longitudinal air-trunks extending forward therefrom and communicating therewith and provided with perforated normally stationary fuel-receiving tops, open-top fuel-chutes arranged between some of the pairs of said longitudinal air-trunks, and means for shoving fuel longitudinally into said chutes.

3. In a furnace, the combination, with a transverse air-trunk arranged across the furnace at the rear thereof, of longitudinal air-trunks extending forward therefrom and communicating therewith and provided with perforated fuel-receiving tops, open-top fuel-chutes arranged between some of the pairs of said longitudinal air-trunks, means for shoving fuel longitudinally into said chutes, and a steam-pipe running through said transverse air-trunk and discharging through the top thereof.

4. In a furnace, the combination, with a transverse air-trunk, of longitudinal air-trunks leading therefrom and communicating therewith and provided with perforated fuel-receiving tops, longitudinal open-top fuel-chutes arranged between pairs of said longitudinal air-trunks, rocking grate-bars arranged to flank each of said longitudinal air-trunks, and means for shoving fuel longitudinally into said fuel-chutes.

5. In a furnace, the combination, with a transverse air-trunk arranged across the furnace at its rear, of longitudinal air-trunks leading therefrom and communicating therewith and provided with perforated fuel-receiving tops, longitudinal open-top fuel-chutes arranged between pairs of said longitudinal air-trunks, rocking grate-bars arranged to flank each of said longitudinal air-trunks, means for shoving fuel longitudinally into said fuel-chutes, and a steam-pipe arranged in the air-trunk and discharging through the top thereof.

811,558. GATE. EDWARD B. HANKEN, New Douglas, Ill. Filed Apr. 7, 1905. Serial No. 254,576.



Claim.—1. The combination with a support, of an upright pintle-bar carried thereby, a swinging gate counterbalanced upon the top of the pintle-bar, and a substantially U-shaped clip loosely embracing the pintle-bar and straddling the lower portion of the gate, the sides of the clip being longitudinally slotted, and fastening means carried by the gate and adjustably engaging the slots.

2. The combination with a support, of a swinging gate having a rear extension pivotally sustained upon the top of the support, an upright rising from the gate in front of the pivotal support of the gate, a cross-bar carried by the upright, truss-bars extending from the top longitudinal bar of the gate rearwardly across the cross-bar and connected to the rear end of the extension, and a counterweight supported upon the extension in rear of the pivotal support.

3. The combination with a support, of a swinging gate having a rear extension pivotally sustained upon the top of the support, a counterbalance carried by the rear extension, an upright rising from the top of the gate, a brace extending between the counterweight and the upright, a latch carried by the free end of the gate, a guide carried by the brace in rear of the pivotal support of the gate, and a flexible latch-controlling element extending rearwardly from the latch and through the guide with portions extending at opposite sides of the gate.

4. The combination with a vertically-adjustable swinging gate, a latch-post having a vertically-adjustable keeper, a front extension at the lower edge of the gate for engagement with the keeper in the closed condition of the gate to support the gate against sagging.

5. The combination with a vertically-adjustable swinging gate, a latch-post having a vertically-adjustable keeper adjacent the lower end thereof, a longitudinal projection of the lower bar in front of the gate and disposed for engagement with the keeper in the closed condition of the gate and to support the gate against sagging.

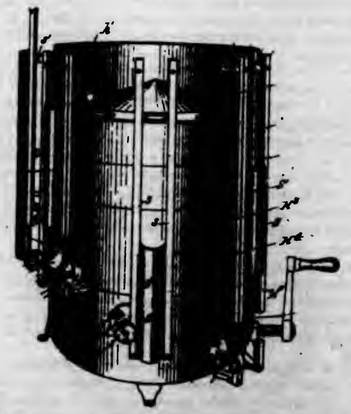
6. The combination with a vertically-adjustable swinging gate, a latch-post having a vertically-adjustable keeper adjacent its lower end and open at opposite sides, a front extension of the lower bar of the gate disposed to enter the keeper through either side thereof and to support the gate against sagging when closed.

7. The combination with a vertically-adjustable swinging gate, a latch-post having a vertically-adjustable keeper upon the lower portion thereof, of a longitudinal bar extended in front of the gate and provided with an antifriction-roller to enter the keeper and support the gate against sagging when closed.

8. The combination with a vertically-adjustable swinging gate, a latch-post, a vertically-adjustable latch-bar carried by the post, upper and lower keepers carried by the bar, a projection extending in front of the gate and disposed to engage the lower keeper in the closed condition of the gate and to support the gate against sagging, and a latch carried by the gate for engagement with the upper keeper when the gate is closed.

9. The combination of a latch-post having upper and lower substantially horizontal projections, a latch-bar having longitudinal slots receiving the projections, adjustable heads carried by the outer ends of the fastenings and arranged to engage the latch-bar, a washer fitted between the bar and the post to adjust the former with respect to the latter, a keeper carried by the bar, and a vertically-adjustable swinging gate having a latch for engagement with the keeper

811,559. COIN SEPARATING, COUNTING, AND STACKING DEVICE. CHARLES F. HESS, Scranton, Pa. Filed Feb. 10, 1905. Serial No. 245,691.



Claim.—1. In a device of the character set forth, the combination with a series of superposed carriers having apertures therein for the passage of coins of less diameters than the coins adapted to be

handled by the carriers and coin-receptacles in the carriers, of means for distributing the coins to the receptacles and means for discharging the coins from the receptacles in succession.

2. In an apparatus such as described, the combination with a series of superposed carriers having coin-receptacles therein and apertures for the passage of coins of smaller diameters than those to be held in the receptacles and means for imparting movement to said carriers, of dischargers working in said receptacles for discharging the coins therefrom and means for operating said dischargers successively to discharge the coins.

3. In an apparatus such as described, the combination with a series of superposed carriers having coin-receptacles therein and apertures in said receptacles for the passage of coins of less diameters than the coins adapted to be held in said receptacles, of means for moving said carriers and means for discharging the coins from the receptacles successively; substantially as described.

4. In a device of the character described, the combination with a rotary carrier having coin-receptacles therein and apertures for the passage of coins of smaller diameters than the coins adapted to be held by the receptacles, of spring-actuated discharging mechanism for discharging coins from the receptacles and means for retracting the discharging mechanism by the movement of the carrier.

5. In a device such as described, the combination with a rotary carrier, of a series of circumferentially-arranged coin-receptacles and apertures for the passage of coins of smaller diameters than those adapted to seat in the receptacle, of radially-movable spring-actuated discharging mechanism and means for retracting said discharging mechanism against the tension of its spring and embodying an incline; substantially as described.

6. In a device such as described, the combination with a rotary carrier having circumferentially receptacles therein, means for distributing coins to said receptacles and a casing having a coin-discharge aperture with which said receptacles register in succession, of a discharging mechanism operating to discharge the coins through said aperture in the casing embodying an impelling-spring and means for retracting the discharging mechanism.

7. In a device such as described, the combination with a rotary carrier having circumferentially-arranged coin-receptacles therein and apertures in said receptacles for the passage therethrough of coins of less diameter than the coins adapted to be held in said receptacles, of radially-movable discharging mechanism and means for moving said discharging mechanism radially outward to discharge the coins successively from the receptacles.

8. In a device such as described, the combination with a series of superposed carriers mounted on a common shaft adapted to be rotated thereby and each having a series of circumferentially-arranged coin-receptacles therein and apertures in the superposed carriers for the passage of coins of less diameters than those adapted to be held in the receptacles, of radially-movable discharging mechanism for each carrier, means for moving said discharging mechanism impulsively outward and means for retracting the discharging mechanism.

9. In a device such as described the combination with a rotary carrier having circumferentially-arranged coin-receptacles therein and means for discharging the coins from said receptacles in succession, of a distributer having a yielding face overlying said carrier for spreading and distributing the coins to the receptacles; substantially as described.

10. In a device such as described, the combination of a rotary carrier having circumferentially-disposed coin-receptacles therein and means for discharging the coins from said receptacles in succession, of a brush overlying the carrier for distributing the coins to the receptacles; substantially as described.

11. In a device of the character described, the combination of a rotary carrier having circumferentially-disposed coin-receptacles therein and discharging mechanism for discharging the coins from said receptacles in succession, of a yielding distributer overlying said carrier for distributing the coins to the receptacles; substantially as described.

12. In a device such as described, the combination with a rotary carrier having circumferentially-disposed coin-receptacles therein with apertures for the passage of coins of smaller diameters than those adapted to be held by the receptacles, and a yielding distributer for distributing the coins to the receptacles; substantially as described.

13. In an apparatus such as described, the combination with the rotary carrier having circumferentially-disposed coin-receptacles therein and apertures for the passage of coins of smaller diameters than those adapted to be held by the receptacles and a discharging mechanism for discharging the coins from the receptacles in succession, of a succession of brushes for distributing the coins to the receptacles and apertures, and means for yieldingly supporting said brushes in position in proximity to the carrier; substantially as described.

14. In an apparatus such as described, the combination with a rotary carrier having circumferentially-disposed coin-receptacles therein and means for discharging the coins from said receptacles in succession, of annular walls between which the coins are confined in position to enter the receptacles; substantially as described.

15. In a device such as described the combination with the rotary carrier having circumferentially-disposed coin-receptacles therein and means for discharging the coins from said receptacles in succession, of a casing embodying annular walls between which the coins are confined in position to enter the receptacles, and distributers between said walls in proximity to the carrier; substantially as described.

16. In a device such as described, the combination with the rotary carrier having circumferentially-disposed coin-receptacles therein and means for discharging the coins from said receptacles in succession, of a casing embodying annular walls overlying the carrier and between which the coins are confined in position to enter the receptacles and a pivoted distributer mounted between said annular walls in position to rest in proximity to the upper surface of the carrier; substantially as described.

17. In a device such as described, the combination with a rotary carrier having a series of circumferentially-disposed coin-receptacles therein, means for distributing the coins to the receptacles and annular walls between which the coins are confined in position to enter the receptacles, of a discharging mechanism embodying radially-movable dischargers, means for impelling said dischargers outwardly and a fixed incline for moving said dischargers inwardly.

18. In a device such as described the combination with a rotary carrier having a series of circumferentially-arranged coin-receptacles, of spring-actuated sliding dischargers working in said receptacles and a fixed incline for retracting said dischargers; substantially as described.

19. In a device for separating coins of differing diameters, the combination of a support on which the coins rest having apertures therethrough for the passage of coins of smaller diameter, said apertures having inclines at one side thereof and means for effecting a relative movement of the coins and support toward the sides of the apertures having the inclines.

20. In a separator for coins, the combination of a carrier having apertures therein for the passage of coins of smaller diameters, said apertures in part only conforming to the peripheral shape of the coins and having inclines on one side thereof, of means for distributing the coins to said apertures; substantially as described.

21. In a device such as described, the combination with a rotary carrier having apertures therein for the passage of coins of smaller diameters, and inclines on the rear sides of said apertures for preventing the entry of the forward edge of the coin into the apertures and means for distributing the coins to the apertures as the carrier is rotated; substantially as described.

22. In an apparatus such as described the combination with the rotary carrier having radially-arranged coin-receptacles therein, apertures in said receptacles of less diameters than the receptacles and inclines projecting into said apertures on the rear sides thereof, of means for rotating the carrier and means for discharging coins from the receptacles; substantially as described.

23. In a device for separating coins of different diameters, an apertured support over which the coins are distributed to the apertures in the support, said apertures having a transverse diameter equal to or greater than the coins adapted to pass therethrough and a projection extending below the level of the face of the support from one side of the aperture, said projection having an inclined upper face against which the forward edge of coins tending to enter the aperture are deflected upwardly and out of the aperture; substantially as described.

24. In an apparatus such as described, the combination of a series of separable units arranged in succession one above the other and each embodying a coin-carrier and discharging mechanism, said coin-carrier of each unit having apertures therethrough for the passage of coins of smaller diameters than those adapted to be discharged by the discharging mechanism of that unit.

25. In an apparatus such as described the combination with a cylindrical casing formed in separable sections arranged one above the other, of coin-separating and radially-operating discharging mechanisms mounted in each section, operating simultaneously to separate and discharge coins, the separating and discharging mechanisms for the larger coins being arranged above the separating and discharging mechanisms for the smaller coins; substantially as described.

26. In an apparatus such as described the combination with a cylindrical casing, a central shaft and means for rotating said shaft, of a series of coin separating and discharging mechanisms rotated by the shaft and located one above the other within the casing.

27. In an apparatus such as described, the combination with a series of rotary coin separating and distributing mechanisms arranged one above the other and adapted to each permit of the passage therethrough of coins of smaller denominations, of a series of coin-receivers disposed in succession around said coin separating and distributing mechanisms and each adapted to receive coins from one of said mechanisms; substantially as described.

28. In an apparatus such as described, the combination with a series of coin-carriers arranged one above the other on a vertical axis and adapted to rotate horizontally and coin separating and discharging means substantially as described, of a series of coin-receivers disposed in succession around said coin-carriers and each adapted to receive the coins discharged from one of said carriers, as set forth.

29. In an apparatus such as described, the combination with a horizontally-rotatable coin-carrier and means for discharging coins radially therefrom, of a counting and indicating mechanism controlled by the coin as discharged from the carrier and a movable coin-receiver whose position with relation to the carrier is controlled by said counting and indicating mechanism.

30. In an apparatus such as described, the combination with a horizontally-rotatable coin-carrier and means for discharging coins radially therefrom of a vertically-movable coin-receiver, mechanism controlling the position of said coin-receiver with relation to the carrier and itself controlled by the coin discharged from the carrier; substantially as described.

31. In an apparatus such as described, the combination with a horizontally-rotatable coin-carrier and means for discharging coins radially therefrom, of a vertically-movable coin-receiver into which the coins are distributed and feeding mechanism for the coin-receiver actuated by the discharged coin; substantially as described.

32. In an apparatus such as described, the combination with a horizontally-rotatable coin-carrier and mechanism for discharging coins radially therefrom, of vertically-arranged guides in proximity to said carrier, a coin-receiver mounted in said guides and feeding mechanism controlling the positon of said said receiver in the guides and having an operating part projecting into the path of the coin being discharged; substantially as described.

33. In an apparatus such as described, the combination with the coin separating and discharging mechanism, of a counting and indicating mechanism actuated by the coins being discharged, means for automatically returning said indicating mechanism to zero, and a coin-receiver advancing in unison with said mechanism whereby the counting mechanism will indicate the number or value of coins in the receiver when less than equal to the capacity of the receiver; substantially as described.

811,560. **CONCRETE BUILDING CONSTRUCTION.** JAMES B. HINCHMAN, Denver, Colo. Filed June 24, 1904. Serial No. 213,970.

Claim.—1. A shearing-arm for tension-rods consisting of a single piece of wire twisted upon itself and having one end formed in a loop said loop being bent at an angle to the arm and back upon itself.

2. A shearing-arm for tension-rods consisting of a single piece of wire twisted upon itself and having one end formed in a loop, the said loop being twisted so as to form a double loop and being bent at an angle to the arm and back upon itself.

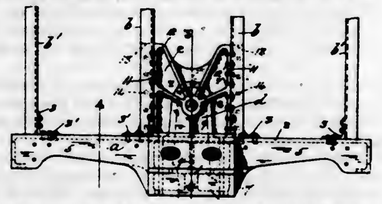
3. A tension-rod for composite building purposes, having shearing-arms removably mounted at angles thereon, each of said shearing-arms having one of its ends bent at an angle to itself, the said tension-rod passing through the said bent end, and a wedge for securing the shearing-arms to the tension-bar inserted between each of the said shearing-arms and the tension-bar.

4. A tension-rod for composite building purposes comprising shearing-arms removably mounted thereon, each shearing-arm consisting of a single piece of wire twisted upon itself and having one of its ends formed in a loop the said looped end being bent at right angles upon itself, the said tension-rod passing through the said looped end and means for securing the shearing-arm to the tension-bar inserted between the said arm and bar.

5. A tension-rod for composite building purposes comprising shearing-arms removably mounted thereon, each shearing-arm consisting of a single piece of wire twisted upon itself and having one end formed in a loop, the said loop being twisted so as to be divided into a double loop and being bent at right angles upon itself, the said tension-rod passing through the said looped end and a wedge for securing the shearing-arm to the tension-bar inserted between the said arm and bar.

6. The combination with the reinforcing-rods of a reinforced concrete beam, of stirrups or shear-bars bent partially around said reinforcing-rods and provided with registering loops or eyes, key-bars passing through said loops or eyes and engaging the under side of said reinforcing-rods to hold said stirrups in place, substantially as described.

811,561. **LOCOMOTIVE-TENDER FRAME.** CLARENCE H. HOWARD, St. Louis, Mo. Filed Nov. 22, 1905. Serial No. 288,580.

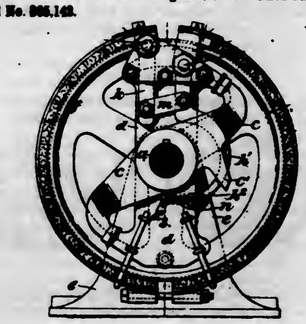


Claim.—1. In a locomotive-tender frame, the combination with the longitudinal sills, of an end sill having a central opening transversely therethrough for the draw-bar, a draw-bar pocket integral with the end sill and projecting rearwardly therefrom between the middle longitudinal sills, and in alinement with the said opening, a bracket projecting from each side of, and integral with the said pocket, and with the end sill, the said brackets having their outer lateral portions adapted to bear against the middle longitudinal sills, a pocket projecting from the front side of the end sill and integral therewith for receiving the buffer-springs, and means for fixing the said brackets and end sill respectively, to the longitudinal sills, substantially as described.

2. In a locomotive-tender frame, the combination with the longitudinal sills, of an end sill having a central opening transversely therethrough for the draw-bar, a draw-bar pocket integral with the end sill and projecting rearwardly therefrom between the middle longitudinal sills, and in alinement with the said opening, a pocket projecting from the front side of the end sill and integral therewith for receiving the buffer-springs, and means for fixing the end sill to the longitudinal sills, substantially as described.

3. In a locomotive-tender frame, the combination with the longitudinal sills, of an end sill having a central opening transversely therethrough for the draw-bar, a pocket projecting from the front side of the end sill and integral therewith for receiving the buffer-springs, and means for fixing the end sill to the longitudinal sills, substantially as described.

811,562. **FRICTION DEVICE FOR BRAKES AND CLUTCHES.** CHARLES W. HUNT, West New Brighton, N. Y. Filed June 14, 1905. Serial No. 265,142.



Claim.—1. A friction device for brakes and clutches, comprising a friction-band, a friction-surface to coöperate with said band, differential levers independent and substantially radial to which the ends of said band are respectively secured and means to move both of said levers in one direction or the other, whereby the ends of said band are moved differentially in one direction or the other.

2. A friction device for brakes and clutches, comprising a friction-band, a friction-surface to coöperate with said band, differential levers independent and substantially radial to which the ends of said band are respectively secured, a support for said levers, said support and said friction-surface being relatively movable, and means to move said levers in one direction or the other.

3. A friction device for brakes and clutches, comprising a friction-band, a friction-surface to coöperate with said band, differential levers independent and substantially radial to which the ends of said band are respectively secured, a support for said levers, a connection between said levers, and means to actuate said levers.

4. A friction device for brakes and clutches comprising a friction-band, a friction-surface to coöperate with said band, two substantially radial levers pivoted at points between their ends and having respectively unequal arms, the ends of the band being respectively secured to the outer ends of said levers, a common support for said levers, a link connecting the inner arms of said levers at different distances from the pivots respectively, and means to actuate said levers.

5. A friction device, comprising a friction-band, a stationary friction-surface to coöperate with said band, a driving part, a driven part, and differential levers mounted on said driven part and having the ends of said band connected thereto respectively.

6. A friction device, comprising a friction-band, a stationary friction-surface to coöperate with said brake, a driving part, a driven part, differential levers mounted on said driven part and having the ends of said band connected thereto respectively, and a link connecting said levers.

7. A friction device, comprising a friction-band, a stationary friction-surface to coöperate with said brake, a driving part, a driven part, differential levers mounted on said driven part and having the ends of said band connected therewith respectively, and a spring operating on one of said levers to maintain frictional contact between said band and said friction-surface.

8. A friction device, comprising a friction-band, a stationary friction-surface to coöperate with said brake, a driving part, a driven part, and differential levers mounted on said driven part and having the ends of said band connected thereto respectively, said driving part being adapted to engage one of said levers in backward movement.

811,563. LACQUER OR VARNISH. JOHN P. IZART, New York, N. Y. Filed Sept. 20, 1905. Serial No. 279,087.

Claim.—1. The new lacquer or varnish consisting of a distillate from oil-gas tar passing over below 200° centigrade in admixture with one of the group of chlorids consisting of chlorid of tin, chlorid of bismuth, chlorid of antimony, and chlorid of aluminium, substantially as described.

2. The new lacquer or varnish consisting of a distillate of oil-gas tar passing over below 200° centigrade admixed with aluminium chlorid, substantially as described.

3. The new lacquer or varnish consisting of a fraction of the distillate from oil-gas tar passing over below 200° centigrade in admixture with one of the group of chlorids consisting of chlorid of tin, chlorid of bismuth, chlorid of antimony, and chlorid of aluminium, substantially as described.

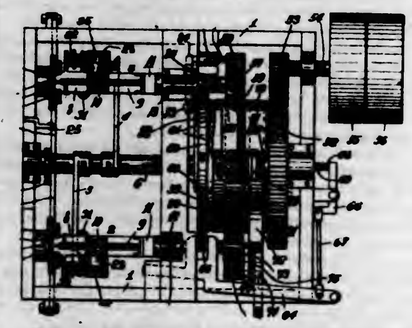
4. The new lacquer or varnish consisting of a fraction of the distillate of oil-gas tar passing over below 200° in admixture with aluminium chlorid, substantially as described.

811,564. ATTACHMENT TO SPECTACLES. JOHN P. JACKSON, Orleans, Ind. Filed Oct. 31, 1904. Serial No. 230,203.

Claim.—1. In an attachment for spectacles and the like, a frame including a pair of stirps curved to follow the general contour of the lower portions of a spectacle-frame, a nose-engaging spring connecting said stirps and tending to draw them toward each other, clips carried by the stirps and adapted to engage the frame of the spectacles, and auxiliary lenses carried by said stirps and disposed at an angle to the general plane to which the stirps and spring are arranged.

2. In an attachment for spectacles and the like, a frame including a pair of curved stirps, a spring connecting said stirps and tending to draw the same toward each other, nose-guards secured to the spring, auxiliary lens-supporting frames secured at their lower edges to the stirps at points near the ends of the latter, lenses in said supporting-frames, and spring-clips carried by said curved stirps and adapted to engage the frame of the main glasses.

811,565. WIRE BENDING AND TWISTING MACHINE. ARCHIBALD KENT and ROBERT ORR, New York, N. Y.; said Kent assignor to said Orr. Filed Mar. 11, 1905. Serial No. 249,581.



Claim.—1. In a machine of the character set forth, two wire-bending dies, having grooves, which, when brought together, form a closed mold, whose interior conforms substantially to the configuration of the blank desired and closely embraces the same, and means for opening and closing the mold.

2. In a machine of the character set forth, two wire-bending dies, having grooves, which, when brought together, form a closed mold, whose interior conforms substantially to the configuration of the blank desired and closely embraces the same, a core member adapted to be moved into and out of position between the dies, and around which the blank is bent, and means for operating the core member and for opening and closing the mold.

3. In a machine of the character set forth, two wire-bending dies, having grooves, which, when brought together, form a closed mold, whose interior conforms substantially to the configuration of the blank desired and closely embraces the same, a core member adapted to be moved into and out of position between the dies, and around which the blank is bent, means for operating the core member and for opening and closing the mold, and means for stripping the blank off the core member.

4. In a machine of the character set forth, two wire-bending dies, having grooves, which, when brought together, form a closed mold, whose interior conforms substantially to the configuration of the blank desired and closely embraces the same, a movable member in one of said dies adapted to assist in shaping the wire, and means for opening and closing the mold.

5. In a machine of the character set forth, two wire-bending dies, having grooves, which, when brought together, form a closed mold, whose interior conforms substantially to the configuration of the blank desired and closely embraces the same, a core member adapted to be moved into and out of position between the dies, and around which the blank is bent, a movable member in one of said dies adapted to assist in shaping the wire, and means for operating the core member and for opening and closing the mold.

6. In a machine of the character set forth, two wire-bending dies, having grooves, which, when brought together, form a closed mold, whose interior conforms substantially to the configuration of the blank desired and closely embraces the same, a core member adapted to be moved into and out of position between the dies, and around which the blank is bent, a movable member in one of said dies adapted to assist in shaping the wire, means for operating the core member and for opening and closing the mold, and means for stripping the blank off the core member.

7. In a machine of the character set forth, two wire-bending

dies, one of which is stationary, and the other of which is movable, having grooves, which, when brought together, form a closed mold, whose interior conforms substantially to the configuration of the blank desired and closely embraces the same, a hinge connecting the two dies, and means for operating the movable die to open and close the mold.

8. In a machine of the character set forth, two wire-bending dies, one of which is stationary, and the other of which is movable, having grooves, which, when brought together, form a closed mold, whose interior conforms substantially to the configuration of the blank desired and closely embraces the same, a hinge connecting the two dies, a core member pivoted at right angles to the hinge connecting the two dies, adapted to be moved into the stationary die before the mold is closed by the movable die, and means for operating the core member and the movable die to open and close the mold.

9. In a machine of the character set forth, two wire-bending dies, one of which is stationary, and the other of which is movable, having grooves, which, when brought together, form a closed mold, whose interior conforms substantially to the configuration of the blank desired and closely embraces the same, a hinge connecting the two dies, a core member pivoted at right angles to the hinge connecting the two dies, adapted to be moved into the stationary die before the mold is closed by the movable die, means for operating the core member and the movable die to open and close the mold, and means for stripping the blank off the core member.

10. In a machine of the character set forth, a stationary and a movable die, a hinge connecting the said dies, a core member pivoted at right angles to the hinge connecting the dies, and means for operating the core and movable die.

11. In a machine of the character set forth, a stationary and a movable die, a hinge connecting the said dies, a core member pivoted at right angles to the hinge connecting the dies, means for operating the movable die, a cam carried by the hinge connecting the dies, and means for operating the core member from the said cam.

12. In a machine of the character set forth, two wire-bending dies adapted to be brought together, a core member adapted to be moved into and out of position between the two dies, and around which the wire is bent, a stripping member surrounding the core member and moving therewith within which it recedes when moved out of position between the dies, and from which it emerges when moved into position between the dies.

13. In a machine of the character set forth, two wire-bending dies adapted to be brought together, a core member pivotally supported and adapted to be moved into and out of position between the two dies, and around which the wire is bent, a stripping member surrounding the said core member, pivoted eccentrically to the pivot of the core member, within which the said core member recedes when moved out of position between the dies, and from which it emerges when moved into position between the dies.

14. In a machine of the character set forth, two wire-bending dies, one of which is stationary, and the other of which is movable, a hinge connecting the said dies, a core member pivoted at right angles to the hinge of the dies, adapted to be moved into and out of position on the stationary die, and around which the wire is bent, a stripping member surrounding the said core member, pivoted eccentrically to the pivot of the said core member, within which the core member recedes when moved out of position from the stationary die, and from which it emerges when moved into position on the stationary die, a cam on the hinge connecting the dies, and means for operating the core member from the said cam

15. In a machine of the character set forth, two wire-bending dies, having grooves, which, when brought together, form a closed mold, whose interior conforms substantially to the configuration of the blank desired and closely embraces the same, means for opening and closing the mold, means for pinching the free ends of the wire, and means for rotating the mold.

16. In a machine of the character set forth, two wire-bending dies, having grooves, which, when brought together, form a closed mold, whose interior conforms substantially to the configuration of the blank desired and closely embraces the same, a core member adapted to be moved into and out of position between the dies, and around which the blank is bent, means for operating the core member and for opening and closing the mold, means for pinching the free ends of the wire, and means for rotating the mold.

17. In a machine of the character set forth, two wire-bending dies, having grooves, which, when brought together, form a closed mold, whose interior conforms substantially to the configuration of the blank desired and closely embraces the same, a core member adapted to be moved into and out of position between the dies, and around which the blank is bent, means for operating the core member and for opening and closing the mold, means for stripping the blank off the core member, means for pinching the free ends of the wire, and means for rotating the mold.

18. In a machine of the character set forth, two wire-bending dies, having grooves, which, when brought together, form a closed mold, whose interior conforms substantially to the configuration of the blank desired and closely embraces the same, a movable member in one of said dies adapted to assist in shaping the wire, means for opening and closing the mold, means for pinching the free ends of the wire, and means for rotating the mold.

19. In a machine of the character set forth, two wire-bending dies, having grooves, which, when brought together, form a closed mold, whose interior conforms substantially to the configuration of the blank desired and closely embraces the same, a core member adapted to be moved into and out of position between the dies, and around which the blank is bent, a movable member in one of said dies adapted to assist in shaping the wire, means for operating the core member and for opening and closing the mold, means for pinching the free ends of the wire, and means for rotating the mold.

20. In a machine of the character set forth, two wire-bending dies, having grooves, which, when brought together, form a closed mold, whose interior conforms substantially to the configuration of the blank desired and closely embraces the same, a core member adapted to be moved into and out of position between the dies, and around which the blank is bent, a movable member in one of said dies adapted to assist in shaping the wire, means for operating the core member and for opening and closing the mold, means for stripping the blank off the core member, means for pitching the free ends of the wire, and means for rotating the mold.

21. In a machine of the character set forth, two wire-bending dies, one of which is stationary, and the other of which is movable, having grooves, which, when brought together, form a closed mold, whose interior conforms substantially to the configuration of the blank desired and closely embraces the same, a hinge connecting the two dies, means for operating the movable die to open and close the mold, means for pinching the free ends of the wire, and means for rotating the mold.

22. In a machine of the character set forth, two wire-bending dies, one of which is stationary, and the other of which is movable, having grooves, which, when brought together, form a closed mold, whose interior conforms substantially to the configuration of the blank desired and closely embraces the same, a hinge connecting the two dies, a core member pivoted at right angles to the hinge connecting the two dies, adapted to be moved into the stationary die before the mold is closed by the movable die, means for operating the core member and the movable die to open and close the mold, means for pinching the free ends of the wire, and means for rotating the mold.

23. In a machine of the character set forth, two wire-bending dies, one of which is stationary, and the other of which is movable, having grooves, which, when brought together, form a closed mold, whose interior conforms substantially to the configuration of the blank desired and closely embraces the same, a hinge connecting the two dies, a core member pivoted at right angles to the hinge connecting the two dies, adapted to be moved into the stationary die before the mold is closed by the movable die, means for operating the core member and the movable die to open and close the mold, means for stripping the blank off the core member, means for pinching the free ends of the wire, and means for rotating the mold.

24. In a machine of the character set forth, a stationary and a movable die connected by a hinge at one end, gear-teeth on the said hinge, a reciprocating rack meshing with said gear-teeth, a core member pivoted at right angles to the hinge connecting the dies adapted to be moved into and out of position on the stationary die, means whereby the movement of the hinge is imparted to the core member, and means for causing the rack to reciprocate.

25. In a machine of the character set forth, a stationary and a movable die connected by a hinge at one end, gear-teeth on the said hinge, a reciprocating rack meshing with said gear-teeth, a core member pivoted at right angles to the hinge connecting the dies adapted to be moved into and out of position on the stationary die, a cam moving with the hinge, a friction-roll carried by the core whereby the movement of the hinge moves the core into position between the dies, and means for causing the rack to reciprocate.

26. In a machine of the character set forth, a stationary and a movable die connected by a hinge at one end, gear-teeth on the said hinge, a reciprocating rack meshing with said gear-teeth, a core member pivoted at right angles to the hinge connecting the dies

adapted to be moved into and out of position on the stationary die, a stripper surrounding the said core member, means whereby the

whose outer ends when closed are shaped in the form of a shaft, two

7. In a machine of the character set forth: means for folding the

8. In a wire-working tool, a pair of pivoted

adapted to be moved into and out of position on the stationary die, a stripper surrounding the said core member, means whereby the movement of the hinge is imparted to the core member and to the stripper, and means for causing the rack to reciprocate.

27. In a machine of the character set forth, a stationary and a movable die connected by a hinge at one end, gear-teeth on the said hinge, a reciprocating rack meshing with said gear-teeth, a core member pivoted at right angles to the hinge connecting the dies, a cam moving with the hinge, and a friction-roll carried by the core member, a stripper surrounding the core member and mounted on an eccentric whereby the movement of the hinge causes the core member to be moved into position between the dies and to free itself from the stripper and vice versa upon the return movement, and means for causing the rack to reciprocate.

28. In a machine of the character set forth, a stationary and a movable die connected by a hinge at one end, gear-teeth on the said hinge, a reciprocating rack meshing with the said gear-teeth, a core member pivoted at right angles to the hinge connecting the dies adapted to be moved into and out of position on the stationary die, means whereby the movement of the hinge is imparted to the core member, means for causing the rack to reciprocate and a movable member in the lower die for bending the wire inwardly and forwardly adapted to be operated when the dies are brought together.

29. In a machine of the character set forth, a stationary and a movable die connected by a hinge at one end, gear-teeth on the said hinge, a reciprocating rack meshing with said gear-teeth, a core member pivoted at right angles to the hinge connecting the dies adapted to be moved into and out of position on the stationary die, means whereby the movement of the hinge is imparted to the core member, means for causing the rack to reciprocate, a spring-detent normally in position over the stationary die adapted to prevent the wire from flying upward when the core member moves in over the lower die and adapted to be moved out of the way when the dies are brought together.

30. In a machine of the character set forth, a stationary and a movable die connected by a hinge at one end, gear-teeth on the said hinge, a reciprocating rack meshing with said gear-teeth, a core member pivoted at right angles to the hinge connecting the dies adapted to be moved into and out of position on the stationary die, means whereby the movement of the hinge is imparted to the core member, means for causing the rack to reciprocate, and means for preventing the wire from jumping out of the die.

31. In a machine of the character set forth, a head mounted in bearings at one end, a mold carried by said head composed of two dies whose outer ends are in the shape of a shaft or stud when closed, jaws for clasping said stud formed by the outer ends of the two dies of the mold, and means for rotating the head.

32. In a machine of the character set forth, the combination with a main shaft, of a head, wire-bending members on the said head, means for causing the said wire-bending members to act on the wire during the first third of the revolution of the main shaft, means for rotating the said head during the second third of the revolution of the said main shaft, and means for disengaging the wire-bending members during the third revolution of the said main shaft.

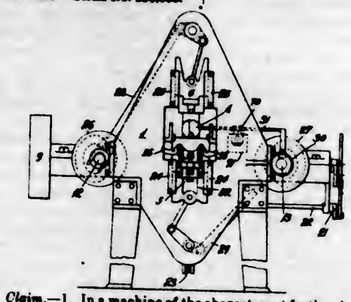
33. In a machine of the character set forth, the combination with a main shaft, of two heads, wire-bending members on each head, means for causing the said wire-bending members to act on the wire to bend the same during the first third of the revolution of the main shaft, means for rotating the said heads in unison during the second part of the revolution of the main shaft, and means for disengaging the said wire-bending members during the third part of the revolution of the main shaft.

34. In a machine of the character set forth, the combination with a main shaft, of two heads, a mold on each of said heads for bending the wire, means for closing the said mold during the first part of the revolution of the main shaft, means for rotating the two heads during the second part of the revolution of the main shaft, and means for opening the said molds during the third part of the revolution of the main shaft.

35. In a machine of the character set forth, the combination of a main shaft, two heads, wire-bending members on each of said heads, means located on the main shaft for closing the said wire-bending members to act and to disengage themselves from each other, transmission mechanism on the main shaft for driving the said heads periodically from the main shaft, wire-pinching mechanism adapted to be operated at periods corresponding to the rotating of the heads, a brake for retarding the motion of the transmission mechanism on the main shaft, and means for stopping the motion thereof.

36. In a machine of the character set forth, the combination with a head, a mold carried by the said head composed of two dies, whose outer ends when closed are shaped in the form of a shaft, two pivoted jaws adapted to grasp the outer ends of the said dies, wire-pinching mechanism carried by the said jaws, toggles controlling the said jaws, and means for closing and opening the said jaws.

811,566. **BODY-FORMING MACHINE.** ARCHIBALD KENT, New York, N. Y., assignor to James W. Kent, Brooklyn, N. Y. Filed Apr. 22, 1905. Serial No. 256,869.



Claim.—1. In a machine of the character set forth, a hook-forming member comprising a pair of clamping-jaws for seizing the blank, one of which is provided with a beveled surface over which the blank is folded, a hook-forming tool for folding the edge of the blank over the said beveled surface, fixed straight guideways inclined throughout their length to correspond to the beveled surface of the clamping-jaw in which the hook-forming tool slides, and means for progressively causing the jaws to seize the blank and the hook-forming tool to travel in the guideways so as to fold the edge of the blank over the beveled surface aforesaid.

2. In a machine of the character set forth: a hook-former, comprising a pair of clamping-jaws adapted to hold the blank and one of which is provided with a beveled surface, a yielding gage for determining the width of the hook to be formed, guides fixed in an inclined position, a hook-forming tool traveling in said guides, and means for causing the hook-forming tool to travel in said guides thereby moving the gage out of the way and folding the tin over the beveled surface aforesaid.

3. In a machine of the character set forth: a hook-former, comprising a pair of clamping-jaws adapted to hold the blank and one of which is provided with a beveled surface, a yielding and horizontally-adjustable gage for determining the width of the hook to be formed, guides fixed in an inclined position, a hook-forming tool traveling in said guides, and means for causing the said hook-forming tool to travel in said guides thereby moving the gage out of the way and folding the tin over the beveled surface aforesaid.

4. In a machine of the character set forth: the combination of two hook-forming members located on each side of the path of progression of the blank through the machine, comprising two pairs of clamping-jaws having oppositely-disposed beveled surfaces one on one of said jaws of each pair, two pairs of guides fixed in an inclined position, hook-forming tools traveling in said guides, and means for causing the said hook-forming tools to travel in opposite directions in said guides.

5. In a machine of the character set forth: the combination of two hook-forming members located on each side of the path of progression of the blank through the machine, comprising two pairs of clamping-jaws having oppositely-disposed beveled surfaces one on one jaw of each pair, yielding gages adjacent to said jaws for determining the width of the hooks to be formed, two pairs of guides fixed in an inclined position, hook-forming tools traveling in said guides, and means for causing the said hook-forming tools to travel in opposite directions in said guides thereby moving the gages out of the way and folding the blank over the beveled surfaces.

6. In a machine of the character set forth: the combination of two hook-forming members located on each side of the path of progression of the blank through the machine, comprising two pairs of clamping-jaws having oppositely-disposed beveled surfaces one on one jaw of each pair, yielding and horizontally-adjustable gages adjacent to said jaws for determining the width of the hooks to be formed, two pairs of guides fixed in an inclined position, hook-forming tools traveling in said guides, and means for causing the said hook-forming tools to travel in opposite directions in said guides thereby moving the gages out of the way and folding the blank over the beveled surfaces.

7. In a machine of the character set forth: means for folding the blank around the horn, comprising a vertically-reciprocating slider, a primary former spring-seated thereon, two wings pivoted on the primary former, a rigid connection pivoted on the slider with one end and on one of the wings with its other end at a point eccentric to the pivot connecting the wing to the primary former, a yielding connection pivoted with one end on the slider and with its other end to the other wing also at a point eccentric to the pivot connecting the wing to the primary former, and means for reciprocating the slider.

8. In a machine of the character set forth: the combination of a horn, means for folding the blank around the horn, comprising a vertically-reciprocating slider, a plurality of forming members carried by said slider and adapted to act uninterruptedly to fold the blank around the horn upon the movement of the slider, means for expanding the horn, and a vertically-reciprocating hammer for clenching the seam of the body.

9. In a machine of the character set forth: the combination of a horn, means for folding the blank around the horn, comprising a vertically-reciprocating slider, a primary former spring-seated thereon, two wings pivoted on said primary former, pivots and connections between the slider and the wings, and means for operating said slider whereby the primary former acts first to clamp the blank on the horn, and the continued movement of the slider acts to cause the wings to fold the blank around the horn and to lock the hooks thereof, means for expanding the horn, and a vertically-reciprocating hammer for clenching the seam of the body.

10. In a machine of the character set forth: the combination of a horn, means for folding the blank around the horn, comprising a vertically-reciprocating slider, a primary former spring-seated thereon, two wings pivoted on the primary former, a rigid connection pivoted on the slider with one end and on one of the wings with its other end at a point eccentric to the pivot connecting the wing to the primary former, a vertical connection pivoted with one end on the slider and with its other end to the other wing also at a point eccentric to the pivot connecting the wing to the primary former, means for reciprocating the slider whereby the primary former acts first to clamp the blank on the horn, and the continued movement of the slider acts to cause the wings to fold the blank around the horn and interlock the hooks thereof, means for expanding the horn, and a vertically-reciprocating hammer for clenching the seam of the body.

11. In a machine of the character set forth: the combination with an expansible and collapsible horn, of an expander, an expander-lever connected to the expander, a stud on which said expander-lever is pivoted, means for adjusting the said stud, and a cam for operating the expander-lever.

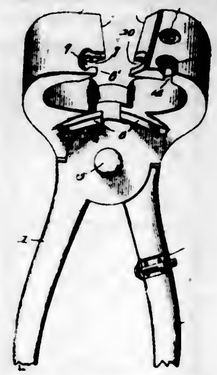
12. In a machine of the character set forth, a horn comprising a main portion, a movable flap normally collapsed pivoted to the main portion so that when the horn is collapsed it presents a substantially continuous surface and when the horn is in its expanded position it forms a substantially complete cylinder as set forth, and means for moving the flap into its expanded position.

13. In a machine of the character set forth, the combination of two hook-forming members located upon each side of the path of progression of the blank through the machine, comprising two pairs of clamping-jaws having oppositely-disposed beveled surfaces, one on one of said jaws of each pair over which the blank is folded, two hook-forming tools each for folding the respective edge of the blank over the coöperating beveled surface, two fixed straight guideways inclined throughout their length to correspond to the beveled surfaces of the clamping-jaws in which the hook-forming tools slide, and means for progressively causing the jaws to seize the blank and the hook-forming tools to travel in opposite directions in the said guides so as to fold the edges of the blank over the beveled surfaces aforesaid.

811,567. **WIRE-WORKING TOOL.** GEORGE S. MAJORS, Schell City, Mo. Filed Dec. 20, 1904. Serial No. 237,851.

Claim.—1. In a wire-working tool, a pair of pivoted jaws, one of which is provided with a longitudinal slot adapted to receive one end of the wire to be twisted and the adjacent jaw with a wire-seat for coaction with said slot, there being an opening formed in the latter jaw disposed in the rear and to one side of the wire-seat for engagement with the opposite end of the wire.

2. In a wire-working tool, a pair of pivoted jaws provided with cutting edges, one of said jaws being provided with a longitudinal slot extending rearwardly from the cutting edge thereof and adapted to receive one end of the wire to be twisted and the adjacent jaw having a recess or wire-seat formed in its cutting edge for coaction with said longitudinal slot, there being an opening in the latter jaw for the reception of the opposite end of the wire.



3. In a wire-working tool, a pair of pivoted jaws provided with cutting edges, one of said jaws being provided with a longitudinal slot extending rearwardly from the cutting edge thereof and adapted to receive one end of the wire to be twisted, and the adjacent jaw having a recess or wire-seat formed in its cutting edge for coaction with said longitudinal slot, there being an opening in the latter jaw for the reception of the opposite end of the wire, the walls of said slot, recess, and opening being countersunk.

4. In a wire-working tool, a pair of pivoted jaws provided with cutting edges, one of said jaws being provided with a longitudinal slot extending rearwardly from the cutting edge thereof and adapted to receive one end of the wire to be twisted and having a portion of its cutting edge adjacent to said slot cut away to facilitate the introduction of the wire, there being a recess or wire-seat in the cutting edge of the adjacent jaw for coaction with said slot, and a recess extending through said jaw to one side of the wire-seat for the reception of the opposite end of the wire.

5. In a wire-working tool, a pair of pivoted jaws having cutting edges, a longitudinal slot extending rearwardly from the cutting edge of one jaw and adapted to receive one end of the wire to be twisted, a recess or wire-seat formed in the cutting edge of the adjacent jaws for coaction with the longitudinal slot, said latter jaw being provided with an opening for the reception of the opposite end of the wire, there being a slot in said jaw extending inwardly from the side edge thereof.

811,568. **GRAPHOPHONE-REPRODUCER.** GEORGE A. MANWARING, Bayonne, N. J., assignor to American Graphophone Company, Washington, D. C., a Corporation of West Virginia. Filed Jan. 13, 1904. Serial No. 188,795.

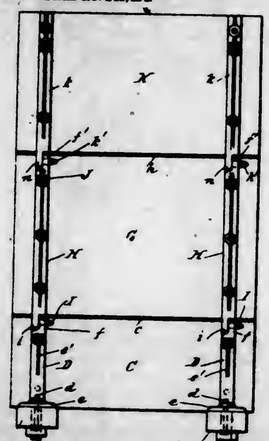
Claim.—1. In a reproducer, the combination of a needle-receiving barrel having an axial bore and having also a longitudinal slot communicating with said bore for substantially the full length of the latter, and a spring-pressed lever pivoted in the upper end of said slot and having its lower face located entirely within said slot, whereby said face may present an extended bearing-surface against the side of an unnotched needle, the upper end of said lever being extended to provide a thumb-piece.

2. In a reproducer, a diaphragm, a stylus-bar connected therewith, a needle barrel or socket at one end of the stylus-bar, a hand-operable clamping-lever pivoted to the barrel and having an elongated gripping-surface extending longitudinally of the barrel and adapted to make extended engagement with the surface of a needle when in place in the barrel, and a spring acting on the lever to normally press its gripping-surface into clamping engagement with the needle.

3. In a reproducer, a diaphragm, a stylus-bar connected therewith, a needle barrel or socket at the outer end of the stylus-bar, a

hand-operable clamping-lever pivoted to the barrel and extending longitudinally with relation thereto, said lever having on one side of its pivot toward the open end of the barrel a gripping-face adapted to engage the surface of a needle in the barrel through a slot or opening in the wall of said barrel, and a coiled spring housed in a transverse recess or chamber opening at one side of the barrel said spring pressing at its outer end against the lever on the other side of its pivot thereby normally forcing the gripping-surface of said lever into clamping engagement with the needle.

811,569. WAGON-BODY. HORACE B. MARTIN, Athens, Ga. Filed Jan. 17, 1906. Serial No. 241,414.



Claim.—1. The combination, with a lower and stationary wagon side, and supporting-pillars secured to the said side and having outwardly-projecting eyes on one-half of their upper end portions; of an adjustable side, and brace-bars secured to the said adjustable side and provided with downwardly and outwardly projecting stop-lugs on one-half of their lower end portions which overlap the said eyes and pivot-pins projecting from the said stop-lugs and engaging with the said eyes.

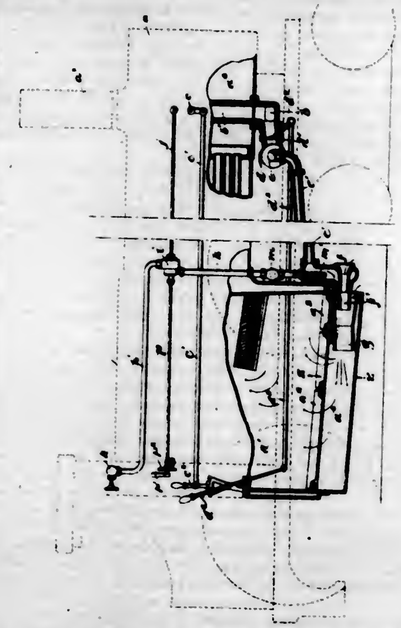
2. The combination, with a lower and stationary wagon side, and supporting-pillars secured to the said side and having outwardly-projecting eyes on one-half of their upper end portions; of an adjustable side, brace-bars secured to the said adjustable side and provided with downwardly and outwardly projecting stop-lugs on one-half of their lower end portions which overlap the said eyes and pivot-pins projecting from the said stop-lugs and engaging with the said eyes, said brace-bars having also outwardly-projecting eyes on one-half of their upper ends, a second adjustable side, and brace-bars secured to the said second adjustable side and provided with downwardly and outwardly projecting stop-lugs on one-half of their lower ends and having pivot-pins which engage with the last said eyes.

3. The combination, with a lower and stationary wagon side, and two pillars secured to the said side and having eyes on one side of their upper end portions; of a removable and adjustable wagon side, two bars secured to the said adjustable side and provided with stop-lugs on one side of their lower end portions which overlap the said eyes and bear against the said pillars and support the adjustable side when in an inclined position, and pivot-pins which project laterally in the same direction from one side of the said stop-lugs and which engage with the said eyes.

811,570. DRAFT APPARATUS FOR BOILER-FURNACES. ALEXANDRE H. MAGNIANT, Paris, France. Filed July 20, 1905. Serial No. 270,272.

Claim.—1. In a draft apparatus for boiler-furnaces, the combination of an ash-box, means for delivering a mixture of exhaust-steam, live steam and air therefrom, a blast-pipe and regulating means therein, said blast-pipe being connected to the means for delivering said mixture to the ash-box, substantially as shown and described.

2. In a draft apparatus for boiler-furnaces, the combination of an ash-box, a blast-pipe leading to the stack, regulating means in said blast-pipe, connecting means from said blast-pipe to said ash-box, a valve for regulating the quantity of exhaust-steam passing into the connecting means, means for injecting live steam into said connecting means, and means for introducing air and thus mixing the live steam, exhaust-steam and air, substantially as shown and described.



3. In a draft apparatus for boiler-furnaces, the combination of an ash-box, an injector provided with an air-inlet, a blast-pipe provided with regulating means, connections between the blast-pipe and the injector, a steam-blower, a live-steam pipe leading from the boiler to the injector, and a distributer located in the live-steam pipe for controlling the supply of steam to the injector and steam-blower, substantially as described.

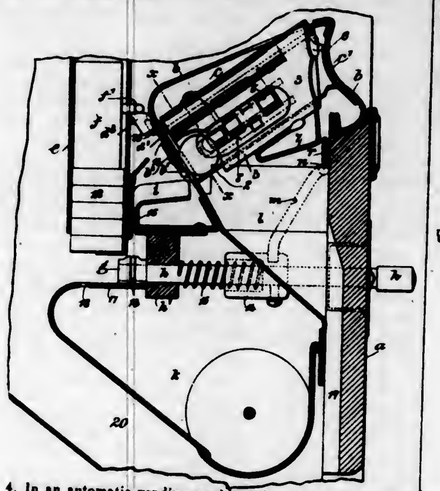
4. In a draft apparatus for boiler-furnaces, the combination of an ash-box, injectors provided with air-inlets, a blast-pipe, means for regulating the exhaust-steam in said blast-pipe to produce the usual draft or by using only part of the exhaust to produce a current of gas from the furnace to the funnel, connections between the blast-pipe and the injectors, a steam-blower, a live-steam pipe leading from the boiler to the injectors, and a distributer located in the live-steam pipe for controlling the supply of steam to the injectors and steam-blower, substantially as described.

811,571. VENDING-MACHINE. ARTHUR MINGUINS, East Orange, N. J. Filed Feb. 8, 1905. Serial No. 244,696.

Claim.—1. In an automatic vending-machine, the combination with a casing, a package-receptacle and a coin-chute, of devices for retaining a good coin in said chute and operative only when the package-receptacle is empty, a push-rod and means actuated upon operating the push-rod to release the coin from the chute.

2. In an automatic vending-machine, the combination with a casing, a package-receptacle and a coin-chute, of devices for retaining a good coin in said chute and operative only when the package-receptacle is empty, a push-rod, means actuated upon operating the push-rod to release the coin from the chute, and means for refunding the coin.

3. In an automatic vending-machine, the combination with a casing and a receptacle for packages to be vended, of a frame, a plate fixed in said frame in an inclined position, a movable plate hinged adjacent to said fixed plate with an intervening coin-passage, means for retaining a coin between said plates when the receptacle is empty, a push-rod, means actuated upon pushing said rod for liberating the coin from its position between said plates, and means for refunding the coin when so liberated.



4. In an automatic vending-machine, the combination with a casing and a receptacle for packages to be vended, of a frame, a fixed plate mounted in an inclined position within said frame, a movable plate adjacent to said fixed plate with an intervening coin-passage, a gravity-plate pivoted in said frame at the lower end of the said coin-passage, means for closing the coin-passage by said gravity-plate when the package-receptacle is empty, means for liberating the coin from its position within the coin-passage and against the said gravity-plate, and means for refunding the coin when so liberated.

5. In an automatic vending-machine, the combination with a casing and a receptacle for packages to be vended, of a frame, a fixed plate mounted in an inclined position within said frame, a movable plate adjacent to said fixed plate with an intervening coin-passage, a gravity-plate pivoted in said frame at the lower end of the said coin-passage, a weight adapted to fit within the said package-receptacle, a projection on the same adapted to engage the said gravity-plate to swing the same across the said coin-passage when the machine is empty, and means for liberating the coin from its position within the coin-passage and against the said gravity-plate.

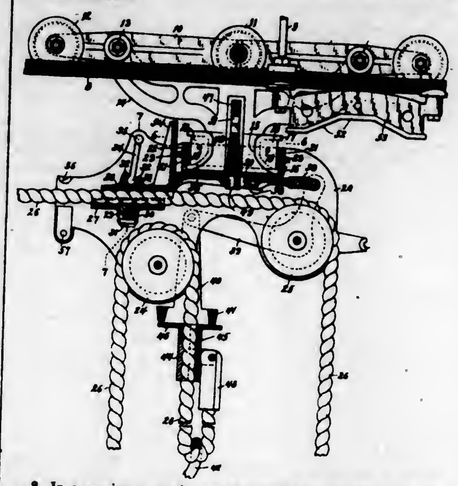
6. In an automatic vending-machine, the combination with a casing and a receptacle for packages to be vended, of a frame, a plate fixed in said frame, a movable plate hinged adjacent to said fixed plate with an intervening coin-passage, means for retaining a coin between said plates when the machine is empty, an inclined contact-arm secured to said movable plate, means for moving said movable plate through the intervention of said inclined contact-arm to liberate the coin from the coin-passage, and means for refunding the coin when so liberated.

7. In an automatic vending-machine, the combination with a casing and a receptacle for packages to be vended, of a frame, a plate fixed in said frame, a movable plate hinged adjacent to the said fixed plate with an intervening coin-passage, a push-rod, means for retaining the coin between said plates when the machine is empty, an inclined contact-arm secured to said movable plate, an arm fixed to said push-rod, a rod secured to said arm, a finger fixed in the said rod in such position as to contact with the said inclined contact-arm when the push-rod is moved inwardly, and means for refunding the coin.

8. In an automatic vending-machine, the combination with a casing and a receptacle for packages to be vended, of a frame, a plate fixed in said frame, a movable plate hinged adjacent to the said fixed plate with an intervening coin-passage, a push-rod, means for retaining the coin between said plates when the package-receptacle is empty, an inclined contact-arm secured to the said movable plate, an arm fixed to said push-rod, a rod secured to said arm, a finger fixed in the said rod in such position as to contact with the said inclined contact-arm when the push-rod is moved inwardly, a hopper, and a chute leading therefrom for refunding the coin.

811,572. HAY-CARRIER. RICHARD HELLER, Appleton, Wis. Filed May 13, 1905. Serial No. 260,501.

Claim.—1. In a carrier, a carriage having pairs of side members pivotally connected together, rollers mounted at the junction of the side members and at the outer ends thereof, and a frame carried by the side members.



2. In a carrier, a carriage comprising pairs of side members pivotally connected together, rollers mounted at the pivotal junction of the side members and at the outer ends thereof, and a frame having pivotal connections with the side members at about one-third the distance from the end rollers to the intermediate rollers.

3. In a carrier, a carriage comprising pairs of side members, the members of each pair having a sliding pivotal connection with each other, rollers mounted at such connections, rollers mounted at the outer ends of the side members, and side frames each having pivotal connections with the side members of one pair at about one-third the distance from the end rollers to the intermediate rollers.

4. In a carrier, a pair of suitably-mounted side frames, a swivel-hub formed in sections which are carried by the side frames, radial webs with retaining and bearing flanges connecting their upper and lower ends respectively formed on the swivel-hub sections, means for connecting together the radial webs of the swivel-hub sections, a supporting-frame comprising side plates, ring-sections carried by the side plates and having tongue-and-groove connections with each other, said ring-sections fitting upon the swivel-hub and bearing upon the bearing-flange and against the edges of the radial webs, and means for connecting the side plates of the supporting-frame together.

5. In a carrier, a suitably-mounted supporting-frame having side plates, adjustable plates having teeth engaging in toothed openings of the side plates, a pivotal pin supported by the adjustable plates, a clamp member pivotally mounted on the pivotal pin, and a suitably-mounted coöperating member with means for operating it.

6. In a carrier, a carriage, a locking-pin carried thereby, a track on which the carriage travels, a trip-block on the track to engage and lift the locking-pin, a suitably-mounted locking-plate, and means on the locking-plate for engaging the trip-block when the locking-pin is raised to move the locking-plate beneath the locking-pin and thereby lock the carriage against moving on the track.

7. In a carrier, a track, a trip-block carried thereby, a carriage movable on the track, a locking-pin carried by the carriage to engage with and be lifted by the trip-block, a locking-plate mounted to slide beneath the locking-pin, a means on the locking-plate for engaging the trip-block and causing the locking-plate to slide beneath the locking-pin to lock the carriage on the track, and means for automatically removing the locking-plate from beneath the locking-pin.

8. In a carrier, a track, a trip-block mounted thereon, a carriage movable on the track, a locking-pin on the carriage to engage and be lifted by the trip-block, a locking-plate having means for engaging the trip-block to move it beneath the locking-pin, and a rope-clamp operated by the locking-plate.

9. In a carrier, a track, a trip-block mounted thereon, a carriage movable on the track, a locking-pin on the carriage to engage and be lifted by the trip-block, a locking-plate adapted to move beneath the locking-pin when said locking-pin is raised, a rope-clamp

operated by the locking-plate, a hoisting-rope passing through the rope-clamp, a stop on the hoisting-rope, and means adapted to be engaged by the stop for moving the locking-plate from beneath the locking-pin and causing the clamp to engage the hoisting-rope.

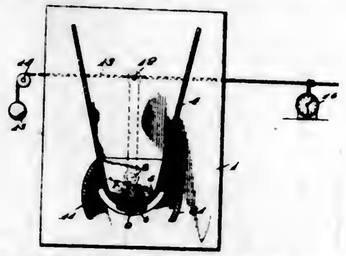
10. In a carrier, a track, a trip-block mounted thereon, a carriage movable on the track, a locking-pin on the carriage to be engaged and lifted by the trip-block, a locking-plate having an opening to receive the locking-pin, a rope-clamp having its clamping member carried by the locking-plate, a link suspending the clamping member, a bell-crank lever on which the locking-plate is supported, means on the locking-plate for engaging the trip-block when the locking-pin is raised for moving the locking-plate beneath the locking-pin and opening the rope-clamp, a hoisting-rope passing through the rope-clamp, and a stop on the hoisting-rope adapted to automatically cause the bell-crank lever to swing and move the locking-plate from beneath the locking-pin and to close the rope-clamp upon the hoisting-rope.

11. In a carrier, a track, a trip-block mounted thereon, a carriage movable on the track, a locking-pin slidable on the carriage and adapted to be engaged and lifted by the trip-block, a supporting-frame swiveled to the carriage and comprising side plates, a locking-plate having lugs passing through slots of the side plates, bell-crank levers pivoted to the supporting-frame and engaging the lugs of the locking-plate, a rope-clamp on the supporting-frame with its clamping member carried by the locking-plate, a link-plate having a rounded end pivotally mounted in a socket of the clamping member and also having trunnion-lugs pivotally mounted in the side plates of the supporting-frame, a hoisting-rope passing through the rope-clamp, means on the locking-plate for engaging the trip-block when the locking-pin is raised to move the locking-plate beneath the locking-pin and release the clamping member from the hoisting-rope, a yoke suspended from the bell-crank levers, a ring carried thereby and surrounding the hoisting-rope, and an adjustable stop on the hoisting-rope to engage the ring and cause the bell-crank levers to move the clamping-plate from beneath the locking-pin and close the rope-clamp upon the hoisting-rope.

12. In a device of the character described, an adjustable stop for a hoisting-rope, comprising a tubular rope-clamp formed in sections, ears on one section embracing the other section, and a cam-lever pivoted between the ears and clamping the sections together upon the hoisting-rope, said cam-lever being adapted to clasp the end of the hoisting-rope.

13. In a carrier, a track, a trip-block mounted thereon, a carriage movable on the track and comprising pairs of side members pivotally connected together, rollers mounted on the side members at their pivotal connections and at their ends, side frames having pivotal connections with the side members between the end rollers and the intermediate rollers, a locking-pin slidable in the side frames and adapted to be engaged and lifted by the trip-block, a swivel-hub formed in sections carried by the side frames, radial webs with retaining and bearing flanges at their upper and lower ends respectively mounted on the swivel-hub sections, a supporting-frame comprising side plates, ring-sections carried thereby with tongue-and-grooved connections with each other and mounted on the swivel-hub with a bearing on the bearing-flange and against the edges of the radial webs, a pulley mounted between the side plates of the supporting-frame, a hoisting-rope passing over said pulley, a pair of bell-crank levers mounted on the shaft of the pulley, a locking-plate pivotally connected to the bell-crank levers and having an opening into which the locking-pin projects, a rope-clamp through which the hoisting-rope passes having one member adjustable in the side plates and its clamping member formed with the locking-plate, a link-plate pivotally connected to the clamping member and to the side plates of the supporting-frame, said clamp being closed upon the hoisting-rope when the locking-plate is in position to receive the locking-pin in its opening, a projecting flange on the locking-plate adapted to be engaged by the trip-block when the locking-pin is raised for moving the locking-plate beneath the locking-pin and opening the rope-clamp, lugs on the side plates of the supporting-frame upon which the locking-plate bears, another pulley mounted in the supporting frame and having the hoisting-rope passing around it, a yoke suspended from the bell-crank levers, a ring carried thereby and surrounding the hoisting-rope, and an adjustable stop on the hoisting-rope having connection with the end thereof to form an engaging loop at the end of the hoisting-rope, said stop adapted to engage the ring and swing the bell-crank levers to move the locking-plate from beneath the locking-pin and to force the clamping member upon the hoisting-rope when the load has been elevated to the desired extent.

811,573. **FEED-BOX.** JAMES P. MCINTYRE, Chicago Lawn, Ill. Filed Nov. 23, 1904. Serial No. 234,070.



Claim.—1. In a device of the character described, the combination of a hopper, comprising a holding-board, sides, and front, said holding-board having an opening, a lever carried by said holding-board and projecting through said opening, valve means carried by said lever, and guard means carried by said hopper.

2. In a device of the character described, the combination of a hopper provided with means for spacing the same from the supporting-walls, a guard secured upon the front of said hopper and adapted to project below the horizontal plane of the bottom of said hopper, a lever movably mounted upon the rear portion of said hopper, and means carried by said lever for controlling the opening and closing of the discharge-aperture of said hopper.

3. In a device of the character described, the combination with a hopper provided with means for spacing the same from a wall, of a guard secured upon said hopper and projecting below the discharge portion thereof, valve means carried by said hopper engaging said discharge portion of the same, and means for automatically actuating said valve means engaging the discharge portion of said hopper.

4. In a device of the character described, the combination of a hopper comprising a back, sides, and front, said back having an opening, and valve-carrying means secured to said hopper and extending through the opening of said back.

5. In a device of the character described, the combination of a hopper, comprising a back, sides, and front, said back having a slot formed therein near the discharge-opening of the hopper, valve means positioned within the slotted portion of said back, and means for causing the movement of said valve means.

6. In a device of the character described, the combination of a hopper, comprising a holding-board, sides secured to said holding-board, a front secured to said sides, said hopper having a discharge-opening, said holding-board provided with a segmental slot formed therein near the discharge-opening of the hopper, parallel spacing-strips secured transversely of said holding-board and upon the back of the same, an angular lever secured to said holding-board and extending through said slot, valve means secured to said lever and normally closing the opening of said hopper, a guard secured to the discharge end of said hopper and inclosing said valve means, a weight secured to said lever, and means for automatically causing movement of said lever.

7. A device of the character described, comprising a hopper, the back of said hopper extending below the discharge end thereof, said back having an opening formed therein contiguous to the discharge end of the hopper, lever means secured to said hopper, said lever means extending through said slotted portion of the back, means carried by said lever for closing the discharge-opening of said hopper, a guard secured to said hopper and extending below the slotted portion of the back, comprising concavo-convexed sides, and substantially flat front, and means for causing movement of said lever means.

8. In a device of the character described, the combination with a hopper, of valve means coacting with said hopper, and a guard secured to said hopper, comprising concavo-convexed sides and a flat front.

9. In a device of the character described, the combination of a hopper provided with an opening formed in the back thereof, valve means movably positioned within said opening, and guard means secured to said hopper and extending below the horizontal plane in which said opening is formed.

10. The combination with a support, of a hopper provided with an opening spaced from said support, and valve-carrying means extending through the opening of said hopper and capable of closing the discharge end of the same.

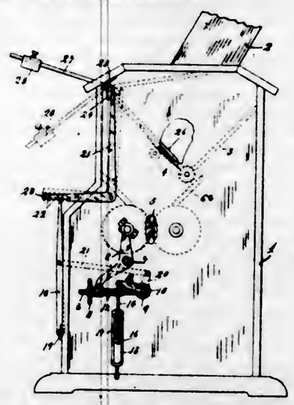
11. The combination with a support, of a hopper having an elongated opening and provided with spacing means, secured to said support, and valve-carrying lever means extending through said elongated opening of said hopper, and normally closing the discharge end of the same.

12. In a device of the character described, the combination of a hopper provided with an elongated opening, valve means coacting with said hopper and positioned within the elongated open portion thereof, a weight secured to said valve means, and means for automatically causing movement of said valve means.

13. The combination with a support, of a hopper provided with an opening spaced from said support, lever means extending through said opening, valve means secured to said lever means, and a weight secured to said lever means.

14. The combination with a support, of a holder-board spaced from said support, a hopper formed upon said holder-board, said holder-board provided with an opening near the discharge end of said hopper, a movable support positioned within the opening of said holder-board, and valve means carried by said movable support.

811,574. **ROLLER-MILL.** JACOB M. NIKOLAI, Madison, Minn. Filed Mar. 13, 1905. Serial No. 249,760.



Claim.—1. In a roller-mill, the combination with a pair of opposing rollers, of means subject to the pressure of the grain on its way to said rollers, operating automatically to separate said rollers, when the pressure of the grain becomes abnormally light, substantially as described.

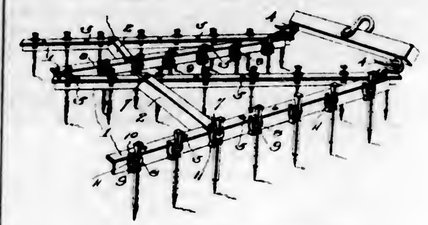
2. In a roller-mill, the combination with a pair of opposing rollers, of a separating-trip operative to separate said rollers when released, of a latch normally holding said trip against movement, and a controller for said latch normally holding the same operative and arranged to cause said latch to release said trip and cause the separation of the rollers, when the grain-pressure on said controller becomes abnormally light, substantially as described.

3. In a roller-mill, the combination with a pair of opposing rollers, of a spring-pressed trip under strain to separate said rollers, a latch normally holding said trip against movement, a pivoted weighted controller-plate having an arm for action on said latch, to cause the same to release said trip, which controller-plate is interposed in a path of movement of the grain on its way to said rollers and is normally held out of action by pressure of the said grain, substantially as described.

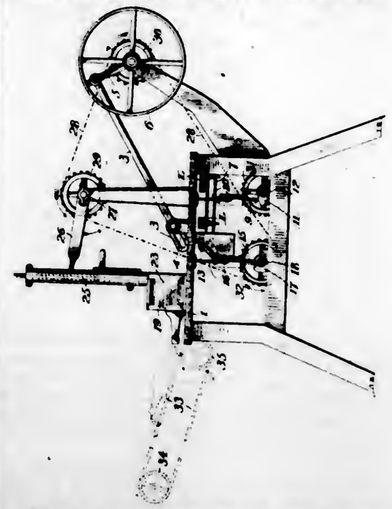
4. In a roller-mill, the combination with a pair of opposing rollers and a hopper located above the same, of a movable support for one of said rollers, a spring-pressed crank-acting trip connected to said roller-support and operative, when released, to separate said rollers, a pivoted latch normally holding said trip against movement, and a weighted pivoted controller-plate within said hopper, normally held inoperative by the pressure of grain in said hopper, and which controller-plate is provided with an arm arranged to act on said latch and cause the latter to release said trip, and said trip to separate the rollers, when the grain-pressure on said plate is abnormally light, substantially as described.

811,575. **HARROW.** WILLIAM L. GRAM, Kingston, Tenn. Filed Feb. 13, 1905. Serial No. 245,696.

Claim.—A harrow comprising side bars of angle metal having horizontal and depending vertical webs, the horizontal webs of the said bars being overlapped and pivotally connected together at their front ends, a rigid cross-bar of angle metal, having a horizontal web to lie on those of the side bars and a vertical web provided with notches at its ends to receive the horizontal webs of the side bars, and means to adjustably secure the ends of the horizontal web of the cross-bar to the horizontal webs of the side bars.



811,576. **BOTTLE-LABELING MACHINE.** THEODORE PANKOW, Sioux Falls, S. D. Filed Sept. 23, 1904. Serial No. 225,678.



Claim.—1. In combination, a suitable guide, a forked carrier traveling thereon, yielding bottle-holding means at one end of the guide, means for supporting a pile of labels at the other end of the guide, a roller between said bottle-holding means and label-holding means, for supplying to the under side of said carrier a material to cause the labels to adhere thereto, means for reciprocating the carrier and for raising and lowering the roller and label-support and means for feeding bottles down through between the arms of the carrier, substantially as described.

2. In combination, a suitable guide, a forked carrier traveling thereon, yielding bottle-holding means at one end of the guide, a vertically-movable plunger, a plate for holding a pile of labels yieldingly supported by said plunger, a cam for raising and lowering the plunger, a second plunger, a roller supported thereby, a cam for raising and lowering said second plunger, means for reciprocating the carrier, and means for feeding the bottles, substantially as described.

3. In combination, a suitable frame including a horizontal guide, yielding bottle-supporting means at one end thereof, a forked carrier traveling in said guide, a crank-shaft journaled in the frame having a pitman connecting it to the slide, a vertically-movable label-support beneath the carrier, a cam-shaft having a cam for operating the label-holder, a roller beneath the carrier, a second cam-shaft having a cam for raising and lowering the roller, sprocket-wheels on the crank-shaft and cam-shafts and a single sprocket-chain engaging all said sprocket-wheels, substantially as described.

4. In combination, a suitable frame including a horizontal guide yielding bottle-supporting means at one end thereof, a forked carrier traveling in said guide, a crank-shaft journaled in the frame having a pitman connecting it to the slide, a vertically-movable label-support beneath the carrier, a cam-shaft having a cam for operating the label-holder, a roller beneath the carrier, a second cam-shaft having a cam for raising and lowering the roller, a vertically-movable plunger for forcing the bottle through said bottle-supporting means, a spring for holding said plunger elevated, a shaft having an arm adapted to engage and depress said plunger, sprocket-wheels on all of said shafts, and a single sprocket-chain meshing with all of said wheels, substantially as described.

811,577. CIRCULAR-KNITTING MACHINE. JOHN B. PAXTON and ELLIS I. O'NEILL, Philadelphia, Pa. Filed Sept. 30, 1903. Serial No. 176,344.

Claim.—1. In a circular-knitting machine a cam-cylinder fitted with two substantially parallel stitch-cams in proximity to each other and with a common return-way; means for sorting the needles into groups and deflecting said groups alternately into the range of one or other of said stitch-cams; and two thread-guides each in position to feed its thread only to the needles which are depressed by one of said stitch-cams, substantially as described.

2. In a circular-knitting machine a needle-cylinder fitted with needles having long and short butts and arranged in alternating groups; a cam-cylinder with a set of reciprocatory knitting-cams, of which that stitch-cam which leads during rotary knitting is provided with a transverse channel of partial depth, across which the short-butt needles pass, while the long-butt needles are deflected over the cam; a supplemental stitch-cam intermediately placed with reference to the regular stitch-cams and having its cam incline substantially parallel to that of the following stitch-cam; and two thread-guides, one of which is in position to feed its thread only into the short-butt needles as they are depressed by the supplemental stitch-cam, and the other of which is in position to feed its thread only into the long-butt needles as they are depressed by the following stitch-cam, substantially as described.

3. In a knitting-machine, a striping device consisting of long and short butt needles arranged in alternating groups; a regular stitch-cam; a supplemental stitch-cam a short distance in advance of the regular stitch-cam and having a needle-depressing cam-surface substantially parallel to, but not reaching to the height of the corresponding surface of the regular stitch-cam; means whereby only the long-butt needles are passed over the supplemental stitch-cam, whereby the two sets of needles are simultaneously depressed in parallel relation to each other—the long-butt needles by the regular stitch-cam—and the short-butt needles by the supplemental stitch-cam; and two separate thread-guides corresponding to the two stitch-cams and each feeding its thread only to the set of needles which is depressed by its stitch-cam.

4. In a circular-knitting machine a needle-cylinder fitted with needles having long and short butts and arranged in alternating groups; a cam-cylinder with a set of reciprocatory knitting-cams, of which that stitch-cam which leads during the rotary knitting is provided with a transverse channel of partial depth across which the short-butt needles pass, while the long-butt needles are deflected over the cam; a movable gate-cam of full depth guarding the entrance of said transverse channel on the side of the cam which is operative when during the reverse motion of reciprocation, it becomes a following stitch-cam; a supplemental stitch-cam intermediately placed with reference to, the regular stitch-cams and having its cam incline substantially parallel to that of the following stitch-cam; two thread-guides, one of which is in position to feed its thread only into the short-butt needles as they are depressed by the supplemental stitch-cam, and the other of which is in position to feed its thread only into the long-butt needles as they are depressed by the following stitch-cam, substantially as described.

5. In a circular-knitting machine a needle-cylinder fitted with needles having long and short butts and arranged in alternating groups; a cam-cylinder with a set of reciprocatory knitting-cams, of which that stitch-cam which leads during rotary knitting is provided with a transverse channel of partial depth, across which the short-butt needles pass, while the long-butt needles are deflected over the cam; a supplemental stitch-cam intermediately placed with reference to the regular stitch-cams and having its cam incline substantially parallel to that of the following stitch-cam: two thread-guides, one of which is in position to feed its thread only into the short-butt needles as they are depressed by the supplemental stitch-cam, and the other of which is in position to feed its thread only into the long-butt needles as they are depressed by the following stitch-cam; and a raising-cam in advance of said reciprocatory knitting-cam; immediately following by a corresponding depressing-cam, substantially as described.

6. In a circular-knitting machine a cam-cylinder fitted with two substantially parallel stitch-cams in close proximity to each other and having a common return-way; means for sorting the needles into groups and deflecting said groups alternately into the range of one or the other of said stitch-cams, by virtue of which those needles which are deflected into the range of the first of the two stitch-cams are not previously raised sufficiently to throw the loops which they carry below their latches; a raising-cam in advance of both said stitch-cams and the sorting means, whereby all of the needles are advanced sufficiently to throw the loops which they carry below their latches; and a depressing-cam immediately following said raising-cam, whereby they are all returned to the normal level before reaching said sorting means, substantially as described.

7. In a circular-knitting machine fitted with a set of reciprocatory knitting-cams a raising-cam in advance of that one of the reciprocatory set which leads during full knitting; a removable depressing-cam immediately following said raising-cam, which when in position returns all of the needles before they reach the reciprocatory set; sorting means whereby some of the needles are passed across the leading stitch-cam without being advanced by it, while the other needles are advanced by it in the regular way; a supplemental stitch-cam intermediately placed with relation to the regular stitch-cams of the reciprocatory set whereby those needles which have been passed across the leading stitch-cam are depressed in a separate line from those which are depressed by the following stitch-cam; and two thread-guides each feeding a separate thread into the two lines of descending needles, substantially as described.

8. In a circular-knitting machine a needle-cylinder fitted with needles having long and short butts and arranged in alternating groups; a cam-cylinder with a set of reciprocatory knitting-cams of which that stitch-cam which leads during full knitting is provided with a transverse channel of partial depth across which the short-butt needles are led without preliminary advance by the leading stitch-cam, while the long-butt needles are thus advanced; a supplemental stitch-cam intermediately placed with reference to the regular stitch-cams of the reciprocatory set, the upper edge of which reaches only to those needles which have failed to advance by reason of their having been led across the transverse channel of the leading stitch-cam; a movable raising-cam in advance of the reciprocatory set whereby when it is set in its position all of the needles may be caused to pass over the leading stitch-cam; and two thread-guides feeding separate threads, the one into the needles which are depressed by the supplemental stitch-cam, and the other into the needles which are depressed by the regular following stitch-cam, substantially as described.

9. In a circular-knitting machine a cam-cylinder fitted with a set of reciprocatory knitting-cams; means whereby certain of the needles are passed across the leading stitch-cam, without preliminary advance by it; a supplemental stitch-cam whereby these needles are depressed in a separate line from those which after passing over the leading stitch-cam are depressed by the following stitch-cam; and two thread-guides at different heights, the lowermost of which feeds its thread to the needles which are depressed by the special stitch-cam, while the other feeds its thread to the needles which are depressed by the regular following stitch-cam, substantially as described.

10. In a circular-knitting machine a cam-cylinder fitted with a set of reciprocatory knitting-cams; means whereby certain of the needles are passed across the leading stitch-cam, without preliminary advance by it; a supplemental stitch-cam whereby these needles are depressed in a separate line from those which after passing over the leading stitch-cam are depressed by the following stitch-cam; two separate thread-guides, one feeding its thread to the needles which are depressed by the special stitch-cam, and the other feeding its thread to the needles which are depressed by the regular following stitch-cam; and a sinker-ring provided with sinkers, with means whereby the sinkers are temporarily advanced in the region of the point where the thread which is fed to the needles which are depressed by the special stitch-cam is knit, substantially as described.

11. In a circular-knitting machine a cam-cylinder fitted with a set of reciprocatory knitting-cams; a special stitch-cam intermediately placed between the regular stitch-cams of the reciprocatory set; means whereby certain of the needles are deflected across the face of the leading stitch-cam without being advanced by it and into the range of the special stitch-cam; while the other needles after being advanced by the leading stitch-cam are depressed by the following stitch-cam in the usual manner, and two thread-guides coöperating the one with the needles which are actuated by the special stitch-cam, and the other with the needles which are actuated by the following stitch-cam, whereby separate threads are fed into each set for the production of striped knitting; substantially as described.

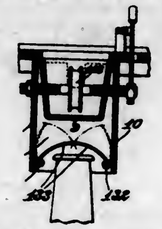
12. In a circular-knitting machine a cam-cylinder fitted with a set of reciprocatory knitting-cams; a special stitch-cam intermediately placed between the regular stitch-cams of the reciprocatory set; means whereby certain of the needles are deflected across the face of the leading stitch-cam without being advanced by it and into the range of the special stitch-cam; while the other needles after being advanced by the leading stitch-cam are depressed by the following stitch-cam in the usual manner; and a raising and depressing cam in advance of the set of reciprocatory knitting-cams, whereby all of the needles are preliminarily advanced and returned, and two thread-guides coöperating the one with the needles which are actuated by the special stitch-cam, and the other with the needles which are actuated by the following stitch-cam, whereby separate threads are fed into each set for the production of striped knitting; substantially as described.

13. In a circular-knitting machine a cam-cylinder fitted with a set of reciprocatory knitting-cams; a special stitch-cam intermediately placed between the regular stitch-cams of the reciprocatory set; means whereby certain of the needles are deflected across the face of the leading stitch-cam without being advanced by it and into the range of the special stitch-cam; while the other needles after being advanced by the leading stitch-cam are depressed by the following stitch-cam in the usual manner; a sinker-ring fitted with a special sinker-cam, whereby the sinkers are temporarily advanced in the region corresponding to the depression of certain of the needles by the special stitch-cam, and two thread-guides coöperating the one with the needles which are actuated by the special stitch-cam, and the other with the needles which are actuated by the following stitch-cam, whereby separate threads are fed into each set for the production of striped knitting; substantially as described.

811,578. SEWING-MACHINE. CHRISTIAN PFENNIGER, St. Louis, Mo., assignor to Landis Machine Company, St. Louis, Mo., a Corporation of Missouri. Original application filed Sept. 14, 1903. Serial No. 173,410. Divided and this application filed July 7, 1904. Serial No. 215,980.

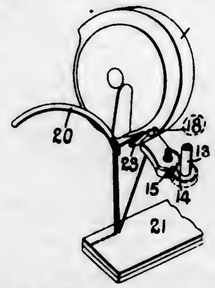
Claim.—1. In a sewing-machine, a support, an overhanging head-frame, a shuttle in the overhanging head-frame, a needle coöperating with said support and substantially in alinement with said shuttle, a wax-pot below the needle and shuttle, a flue leading from said wax-pot to said needle and shuttle, a source of heat beneath the wax-pot, and pivoted deflectors interposed between the source of heat and the wax-pot; substantially as described.

2. In a sewing-machine, a support, stitch-forming members thereon, a wax-pot below said stitch-forming members, a housing surrounding the wax-pot and depending therefrom, a flue leading from said housing to said stitch-forming members, and pivoted deflectors movable to positions to permit the source of heat to act directly upon the wax-pot and movable to positions to deflect the heat from the wax-pot and through the flue; substantially as described.



3. In a sewing-machine, a support, stitch-forming members thereon, a wax-pot, walls depending about the same and adapted to inclose a heater, one of said walls having an opening, a flue-section leading through said opening, housing-plates upon said support forming a flue leading to said stitch-forming members, and pivoted deflectors interposed between the wax-pot and the heater for deflecting the heat from the wax-pot; substantially as described.

811,579. LOOP-SPREADER FOR SEWING-MACHINES. CHRISTIAN PFENNIGER, St. Louis, Mo., assignor to Landis Machine Company, St. Louis, Mo., a Corporation of Missouri. Filed Aug. 14, 1905. Serial No. 274,110.



Claim.—1. In a sewing-machine, a needle, a split loop-opener pivotally mounted in a stationary bearing and having a swinging movement in a horizontal plane approximately at right angles to the path of movement of the needle, gear-teeth formed on said loop-opener, a thread-engaging part adjustably secured in the slotted portion of said loop-opener, a shaft having at its lower end a part provided with gear-teeth which mesh with the gear-teeth on the loop-opener, a cam-actuated rock-shaft, and a connection between said shaft and the first-mentioned shaft whereby movement is imparted to the loop-opener; substantially as described.

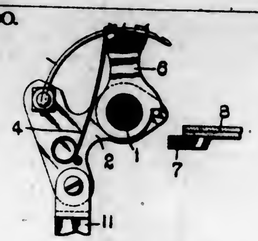
2. In a sewing-machine, a needle, a loop-opener pivotally mounted in a stationary bearing and having a swinging movement at right angles to the path of movement of the needle, gear-teeth formed on said loop-opener, a shaft extending parallel to the pivot of said loop-opener and having at its upper end an arm and at its lower end a part provided with gear-teeth which mesh with the gear-teeth on the loop-opener, a second shaft provided with an arm, means for rocking said shaft, and a link for connecting the arms of said shafts whereby movement is imparted to said loop-opener; substantially as described.

811,580. NEEDLE-GUIDE FOR SEWING-MACHINES. CHRISTIAN PFENNIGER, St. Louis, Mo., assignor to Landis Machine Company, St. Louis, Mo., a Corporation of Missouri. Filed Aug. 14, 1905. Serial No. 274,111.

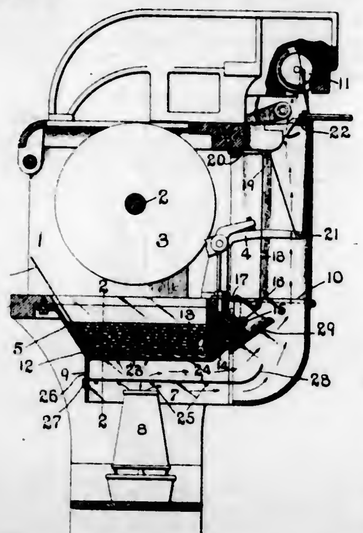
Claim.—1. In combination, a needle-segment provided with a needle, a needle-guide comprising a rocking member having an arcuate edge, spaced lugs carried by said arcuate edge with alining needle-openings, and yielding means for holding said member and said needle-segment normally spaced apart; substantially as described.

2. A needle-guide comprising a pivoted member 6, a guide-lug 9 carried by said member 6 and a reinforcing-lug 10 spaced from the lug 9 and in line therewith, substantially as described.

811,580.



811,581. **HEATING DEVICE FOR SEWING-MACHINES.** Christian Pfeiffer, St. Louis, Mo., assignor to Landis Machine Company, St. Louis, Mo., a Corporation of Missouri. Filed Aug. 14, 1905. Serial No. 274,113.



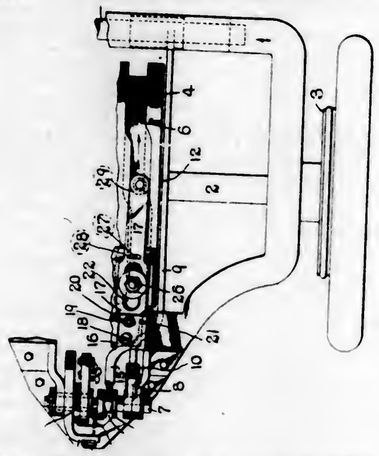
Claim.—1. In a sewing-machine, the combination with a wax-pot and a flue below the same and extending upwardly to the shuttle, of a burner in the flue below the wax-pot, and a sliding cut-off having a curved end extending upwardly in the flue, said cut-off being interposed between the burner and the wax-pot; substantially as described.

2. In a sewing-machine, the combination with a wax-pot having a nipple in one of its walls provided with an opening communicating with an opening through the wall of the wax-pot, an L-shaped flue having its horizontal portion below the wax-pot and its vertical portion extending above the same and terminating adjacent the shuttle, a burner in the horizontal portion of the flue, a deflector-slide interposed between the burner and the wax-pot, and a thread-guard adjacent to the nipple and projecting into the flue for deflecting the heat to prevent burning of the thread by the heat which may pass up the vertical portion of the flue; substantially as described.

3. In a sewing-machine, the combination with a wax-pot having a thread-opening in one wall thereof, a heat-deflector adjacent to the opening in the wall of the wax-pot and extending outwardly therefrom, a flue surrounding the opening and heat-deflector and having a horizontal portion below the wax-pot, a burner below the wax-pot, and means for cutting off the heat from the bottom of the wax-pot, said means being interposed between the burner and the wax-pot; substantially as described.

811,582. **MECHANISM FOR ADJUSTING THE LENGTHS OF STITCHES IN SEWING-MACHINES.** Christian Pfeiffer, St. Louis, Mo., assignor to Landis Machine Company, St. Louis, Mo., a Corporation of Missouri. Filed Aug. 14, 1905. Serial No. 274,115.

Claim.—1. In a sewing-machine, a slidable awl-carrying element, a lever for sliding the awl-carrying element, a part on the lever engaging the awl-carrying element, and means for effecting an adjustable connection between the said part and the lever to aline the awl with the needle of the sewing-machine; substantially as described.



2. In a sewing-machine, a slidable awl-carrying element, a lever for sliding the awl-carrying element, a part on the lever engaging the awl-carrying element, means for effecting an adjustable connection between said part and the lever, and a variable fulcrum for said lever; substantially as described.

3. In a sewing-machine, a slidable awl-carrying element, a rocking lever for sliding said awl-carrying element and having an elongated slot, a variable fulcrum for said lever in said slot, and means independent of the fulcrum for preventing longitudinal movement of said lever; substantially as described.

4. In a sewing-machine, a shaft, a shiftable awl-carrying element on said shaft, a shifter engaging said awl-carrying element and having a socket, a lever having one end in said socket, and an adjusting device for varying the angle of inclination of the shifter with respect to the lever to aline the awl with the needle of the sewing-machine; substantially as described.

811,588. **THREAD-MEASURER FOR SEWING-MACHINES.** Christian Pfeiffer, St. Louis, Mo., assignor to Landis Machine Company, St. Louis, Mo., a Corporation of Missouri. Filed Aug. 14, 1905. Serial No. 274,118.

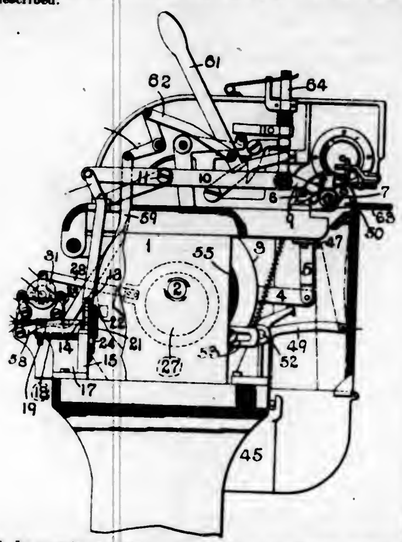
Claim.—1. In a sewing-machine, an element for measuring thread, a clamping means on the respective sides of the thread-measuring element said clamping means comprising a normally rigid base-plate, means for alternately clamping the thread against the respective end portions of said base-plate and means for temporarily destroying the rigidity of said base-plate, substantially as described.

2. In a sewing-machine, a thread-measuring element, means for alternately clamping the thread before and after each operation of the thread-measuring element said means comprising a rigid base-plate and a spring-plate above the same whose ends bind the thread first against one end portion of the base-plate and then against the other end of said base-plate, substantially as described.

3. In a sewing-machine, a thread-measuring element and a thread-clamping means comprising a base-plate having an inherent yielding tendency, means for normally holding the base-plate rigid, means for alternately clamping the thread to the base-plate near the respective ends thereof and means for temporarily destroying the rigidity of said base-plate, substantially as described.

4. In a sewing-machine, a thread-measuring element, and a thread-clamping means cooperating therewith comprising a base-plate, a spring-plate above the same, rocking elements for binding the respective ends of said spring-plate against the base-plate and a rocking cam for alternately actuating said rocking elements, substantially as described.

5. In a sewing-machine, a thread-measuring element, and a thread-clamping means cooperating therewith comprising a base-plate, a spring-plate above the same, rocking elements for binding the respective ends of said spring-plate against the base-plate and means for alternately actuating said rocking element, substantially as described.



6. In a sewing-machine, a thread-measuring element comprising an arm, a rock-shaft carrying said arm, a rock-arm on said rock-shaft, a slide having a cam-face for engagement with said rock-arm, an actuating-cam for engagement with said rock-arm and means for moving the slide so as to vary the operative engagement of the actuating-cam with the rock-arm, substantially as described.

7. In a sewing-machine, a thread-measuring element a rocker-shaft carrying said thread-measuring element, an arm carried by said rocker-shaft, a slide having engagement with said arm, an actuating-cam for rocking the shaft and having intermittent engagement with said arm, a presser-foot mechanism, and means connected to the slide and to the presser-foot mechanism whereby the engagement of the slide with the arm on the rock-shaft will be governed by the position of the presser-foot above the work-table, substantially as described.

8. In a sewing-machine, the combination of a rocking thread-measuring element, a clamping base-plate above said thread-measuring element, a spring-plate above the base-plate, rocking elements adapted to alternately bind the respective ends of the spring-plate against the base-plate and a cam-actuated cam for alternately operating the rocking elements, substantially as described.

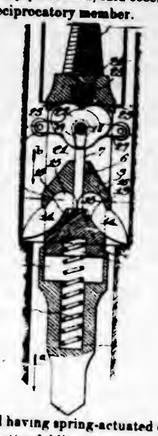
9. In a sewing-machine, the combination of a rocking thread-measuring element, a spring-plate, a base-plate, rocking elements above the spring-plate adapted to alternately bind the respective end portions of the spring-plate against the base-plate, a spring connecting said rocking elements and a rocking cam having alternate engagement with said rocking elements, substantially as described.

10. In a sewing-machine, the combination with a presser-foot, a lever connected to said presser-foot, a slide having a cam-face, a connection between the lever and slide, a rock-shaft, an arm connected to said rock-shaft and bearing against the cam-face, an actuating-cam for said rock-arm, a thread-measuring element carried by said rock-arm, said elements being arranged so that the position of the presser-foot with respect to the work will govern the position of the cam-face with respect to the rocker-arm and thereby control the operative engagement of the actuating-cam with respect to the rocker arm, substantially as described.

811,584. **UNDERREAMER FOR WELLS.** Charles Peters, Nampa, Idaho. Filed Mar. 10, 1905. Serial No. 249,469.

Claim.—1. A boring-head having lateral extensible counterboring-cutters adapted to fold by gravity, and spring-actuating means for extending the same in combination with an eccentric for repressing said spring-actuating means.

2. A boring-head having movable counterboring-cutters adapted to be folded by gravity, and yielding means for extending said cutters, in combination with a reciprocatory member connected with said yielding means for repressing the same, and an eccentric carried by the head and provided with laterally-projecting tripe for contact with the lower end of a pipe-section, said eccentric being operatively connected with the reciprocatory member.



3. A boring-head having spring-actuated counterboring-cutters in combination with cutter-folding devices consisting of a reciprocatory member, and an eccentric having laterally-yieldable arms for contact with the lower end of a pipe-section, and adapted to impart motion to the reciprocatory member.

4. A boring-head having yielding counterboring-cutters disposed for contact at their inner ends, yielding means for holding said cutters extended, and an eccentric for moving said cutters to inoperative position.

5. A boring-head having movable counterboring-cutters housed therein, a plunger mounted to follow said cutters, and an eccentric operatively connected with said plunger for actuating the cutters.

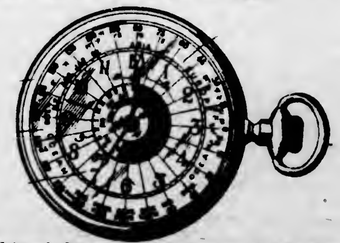
6. A boring-head having recesses formed therein, movable counterboring-cutters housed in said recesses, a plunger disposed to follow said cutters and exclude borings from said recesses when the cutters are extended, and an eccentric operatively connected with said plunger for actuating the cutters.

7. A boring-head having movable counterboring-cutters housed therein, a spring-pressed plunger mounted for reciprocatory movement in the head and operatively connected to said cutters, and an eccentric carried by the plunger for depressing the latter and moving the cutters to operative position.

8. A boring-head having counterboring-cutters housed therein, a spring-actuated plunger having recesses formed therein to receive said cutters, and an eccentric for depressing the said plunger and moving the cutters to operative position.

9. A boring-head provided with opposite communicating recesses and an axial cavity, counterboring-cutters mounted respectively in said recesses for outward swinging movement at their lower ends and adapted to be housed by gravity, the inner ends of said cutters being in contact, a spring-actuated plunger mounted in said cavity, and an eccentric operatively connected with said plunger for actuating the cutters.

811,585. **UNIVERSAL TIMEPIECE.** Isaac F. Phelps, Woodville, Ohio. Filed Jan. 30, 1904. Serial No. 191,351.



Claim.—1. In a geographical timepiece, the combination with hour and minute arbors and the usual hour and minute hands ar-

ranged to make a complete traverse in twelve hours and one hour, respectively, of a rotatable twenty-four-hour dial surrounding the hour-arbor and rotatable in the same direction as the hour-hand and once in twenty-four hours, a rigid twelve-hour local-time dial surrounding the twenty-four-hour dial, and a geographical dial surrounding the twenty-four-hour dial, the minute-hand once every hour, the hour-hand once every twelve hours, and the twenty-four-hour dial every twenty-four hours.

811,586. **DECOY-DUCK STEERING DEVICE.** Charles Pierce, Chicago, Ill. Filed Aug. 14, 1905. Serial No. 274,116.

plates pivoted adjacent to the end of the bar and forming supports on which the cable may be wound, levers pivoted to said plates and having their adjacent ends pivoted to each other, whereby movement of the levers is transmitted simultaneously to both plates to disengage

switch on certain predetermined engagements of said detent, whereby the extra dial may be marked corresponding to a clock-face and still each finger actuate the switch only once in twenty-four hours,

ranged to make a complete traverse in twelve hours and one hour, respectively, of a rotatable twenty-four-hour dial surrounding the hour-arbor and rotatable in the same direction as the hour-hand and once in twenty-four hours, a rigid twelve-hour local-time dial surrounding the twenty-four-hour dial, and a geographical dial surrounding and supporting the local-time dial, the several dials being located in substantially the same plane.

2. In a geographical timepiece, the combination with hour and minute hands and their arbors, of a twenty-four-hour dial rotatable on the hour-arbor in the same direction as the hour-hand but at a different speed and held in place by the hands, a rigid twelve-hour local-time dial surrounding the twenty-four-hour dial, and a peripherally-secured geographical dial surrounding the local-time dial and supporting the same, the several dials being located in the same plane and standard-meridian lines extending over both the local-time dial and the geographical dial from the periphery of the twenty-four-hour dial.

3. In a geographical timepiece, the combination with a twenty-four-hour dial, a twelve-hour dial, and a geographical dial, one of said dials being rotatable, of hour and minute hands, driving mechanism common to the hands and rotary dial and having frictional connection with the latter, and stop mechanism for holding the rotary dial stationary during the setting of the hands, whereby the necessity for turning the dial back after the hands have been set is avoided.

4. In a geographical timepiece, the combination with the hands, a rotary twenty-four-hour dial, a fixed local-time dial, and a fixed geographical dial, of driving mechanism for the rotary dial and the hands, a friction device normally connecting the rotary dial with its driving mechanism, and stop mechanism for holding the said dial stationary during the setting of the timepiece.

5. In a geographical timepiece, the combination with hour and minute hands and their arbors, of a twenty-four-hour dial rotatable on the hour-arbor and retained in place by the hour-hand, said dial making one complete rotation every twenty-four hours and moving in the same direction as the hour-hand, and a stationary combination-dial comprising a local twelve-hour dial, and a geographical dial divided by twenty-four equidistant standard-meridian lines properly numbered, each alternate line being disposed midway between two hour designations of the local-time dial.

6. In a geographical timepiece the combination with hour and minute hands and their arbors, of a twenty-four-hour dial rotatable on the hour-arbor, a stationary combination-dial located in the plane of the twenty-four-hour dial and comprising a local twelve-hour dial, and a geographical dial divided by twenty-four equidistant standard-meridian lines properly numbered, each alternate line being disposed midway between two hour designations of the local-time dial, and gearing whereby the minute-hand makes a complete traverse each hour, the hour-hand each twelve hours and the twenty-four-hour dial each twenty-four hours, the hour-hand indicating the hour on the local dial, the twenty-four-hour dial indicating the hour at any standard meridian, and the minute-hand serving to indicate the minutes past the hour designated by both the hour-hand and the twenty-four-hour dial.

7. In a geographical timepiece the combination with hour and minute hands and their arbors, of a twenty-four-hour dial rotatable on the hour-arbor once in twenty-four hours, a stationary combination-dial comprising a local twelve-hour dial and a geographical dial divided by twenty-four equidistant standard-meridian lines properly numbered, each alternate line being disposed midway between two hour designations of the local-time dial, a friction device normally connecting the twenty-four-hour dial with its driving mechanism, and stop mechanism for holding said dial stationary during the setting of the hands.

8. In a geographical timepiece, the combination with a rigid twelve-hour local-time dial and a geographical dial surrounding and supporting the same, of hour and minute hands and their arbors, mechanism for rotating said arbors, a twenty-four-hour dial rotatable on the hour-arbor and located in the plane of the first-named dials, a gear-wheel mounted on the hour-arbor, a friction device connecting said gear-wheel to the arbor, and gearing operatively connecting said gear-wheel to the twenty-four-hour dial.

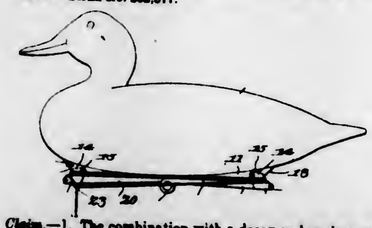
9. In a geographical timepiece, the combination with a rigid twelve-hour local-time dial and a geographical dial surrounding and supporting the same, of hour and minute hands and their arbors, a twenty-four-hour dial surrounding the hour-arbor and located in substantially the same plane as the rigid dials, and a shaft geared to the hour and minute arbors and to the twenty-four-hour dial, said gearing being so proportioned that the minute-hand will rotate once every hour, the hour-hand once every twelve hours, and the twenty-four-hour dial every twenty-four hours.

811,586. DECOY-DUCK-TETHERING DEVICE. CHARLES A. SANUELL, Boston, Ill., assignor of one-half to Alexander H. Pensavitt, Boston, Ill. Filed June 22, 1905. Serial No. 266,429.

Claim.—1. A tether comprising two approximately semicircular members one of which is substantially rigid and has a swivel-eye permanently combined with it, the terminals of the member being provided with slots, and a flexible member having one terminal provided with a tongue permanently to engage one of the slots and its other terminal provided with a tongue for detachable engagement with the other slot.

2. A tethering device embodying two curved members one of which is substantially non-yielding and provided with terminal orifices and the other of which is yielding and provided with terminal tongues to engage the orifices, one of the tongues being bent to form a loop to hold the two members assembled, and a swivel permanently connected with the first-named member.

811,587. DECOY. CHARLES A. SANUELL, Boston, Ill. Filed Oct. 9, 1905. Serial No. 282,077.



Claim.—1. The combination with a decoy and anchor-cable, of means upon which the cable may be wound, and means by which the entire cable may be disengaged by a single motion.

2. The combination with a decoy and anchor-cable of spaced plates upon which to wind the cable, and means to disengage the cable from the plates simultaneously and by a single motion.

3. The combination with a decoy and anchor-cable of spaced and pivoted plates upon which to wind the cable and means to move the plates simultaneously and pivotally by a single motion to disengage the cable.

4. The combination with a decoy and anchor-cable, of movable members forming a support on which the cable may be wound, and means for adjusting said members to cable-disengaging position.

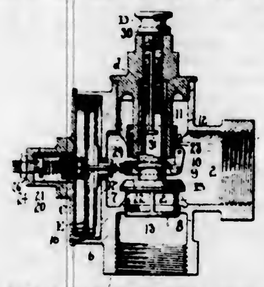
5. The combination with a decoy and anchor-cable, of spaced and pivoted plates upon which the cable may be wound, and a pair of pivotally-connected levers pivoted to said plates and serving to simultaneously move the latter to disengage the cable.

6. The combination with a decoy, of a bar secured longitudinally of the decoy-body, an anchor-cable secured at one end to the bar,

plates pivoted adjacent to the end of the bar and forming supports on which the cable may be wound, levers pivoted to said plates and having their adjacent ends pivoted to each other, whereby movement of the levers is transmitted simultaneously to both plates to disengage the cable.

7. As a new article of manufacture, a bar provided with means for attachment to a body and having inclined ends, plates pivoted to said bar adjacent the ends thereof and forming with the inclined ends of the bar a pair of oppositely-disposed winding-surfaces, levers pivoted to the plates, and means for pivotally connecting the levers to each other, the intermediate pivot being arranged to pass beyond a plane including the pivotal connections of the plates and levers.

811,588. AUTOMATIC GAS-CONTROLLING DEVICE. HUGO SCHNEIDER, Cleveland, Ohio. Filed Sept. 11, 1905. Serial No. 277,822.



Claim.—1. In an automatic gas cut-off, a valve and valve-body, a gas-passage in said body, a catch for said valve, an expanding drum having open communication with said passage, operative connecting means for said drum and valve, and a valve adapted to cut off the flow of gas to said drum.

2. In an automatic gas cut-off, a valve-body and valve therein and an expanding drum open to the gas-pressure adapted to control the closing of said valve, and a supplemental valve connected with said drum adapted to close the gas-inlet of said drum.

3. In an automatic gas-controlling device, a valve-body and a main valve therein, a side chamber and an expanding drum therein having yielding side walls constructed of spring metal, in combination with means to hold the main valve open comprising a catch, operative releasing connections between said drum and said catch, and a valve in said connections to cut off the gas from said drum.

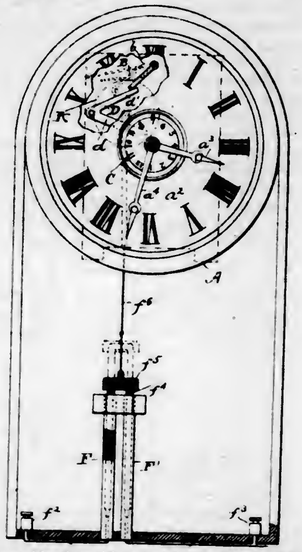
4. In an automatic gas cut-off, a valve-body and valve therein, in combination with an expanding drum and catch mechanism for said valve having connections united with the outer side of said drum, a spring adapted to bear against the drum, to release the catch mechanism, and an adjustable screw adapted to vary the tension of said spring for different gas-pressures acting upon said drum.

5. In an automatic gas cut-off, a body and gas-passage through the same, a main valve having a stem and an annular rib thereon, a guide for said stem and a sleeve on said guide, a catch suspended from said sleeve adapted to engage said rib, an expanding drum open to said gas passage and operating connections with said catch, said connections united with one side of said drum and a spring behind said connections.

6. In an automatic gas cut-off, a hollow body and a valve therein having a tubular stem, a catch adapted to hold said valve open and a device adapted to carry said valve into engagement with said catch, a removable supporting and guiding cap for said valve and said device, means to release said catch and means to raise said valve to cause the same to reengage with said catch comprising a rod engaged within the stem of said valve, a spring-pressed collar inside said stem adapted to be engaged by the lower end of said rod and a removable plug engaged with the upper end of said rod.

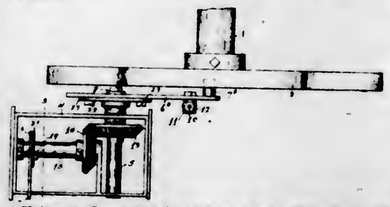
811,589. ELECTRIC TIME-SWITCH. CLYDE O. SHATTO, Sharon, Pa., and LEWIS S. DEITZER, Ravenna, Ohio. Filed June 18, 1903. Serial No. 162,265.

Claim.—1. The combination with the usual clock-face, hands and mechanism for operating the same, of an extra dial marked with a single series of numbers from 1 to 12, a switch adapted to be operated by the clockwork, a detent for controlling the same, fingers for tripping said detent, which fingers stand in proximity to the edge of said extra dial, and mechanism for controlling the actuation of said switch on certain predetermined engagements of said detent, whereby the extra dial may be marked corresponding to a clock-face and still each finger actuate the switch only once in twenty-four hours, substantially as described.



2. The combination with a clock having the usual face, hands and mechanism for driving it, of a small central dial carried by the hour-hand sleeve and numbered near its edge continuously from 1 to 12, said numbering extending entirely around the dial, a pair of fingers adjustably carried by said hour-hand sleeve and located behind said small dial but extending beyond the edge thereof, a switch and mechanism for operating the same, and means whereby said fingers actuate said operating mechanism to close or open the circuit only on certain predetermined engagements of said fingers, substantially as described.

811,590. NEEDLE-OPERATING MECHANISM FOR LOOMS. NELSON SHARUP, Amsterdam, N. Y. Filed Apr. 26, 1905. Serial No. 257,436.



Claim.—1. In an Axminster loom, the combination with the needle-arm and the needle-cam; of a pair of rock-shafts at right angles to each other, upon one of which is fixed the needle-arm; bevel-gear connections between said rock-shafts; a rocker-arm fixed upon the other of said rock-shafts; and a cam-follower on said rocker-arm engageable with said cam.

2. In an Axminster loom, the combination with the needle-arm and the needle-cam; of a pair of rock-shafts at right angles to each other upon one of which said needle-arm is fixed; a rocker-arm fixed upon the other of said rock-shafts; a cam-follower on said rocker-arm engageable with said cam; a pair of intermeshing beveled gears on the respective rock-shafts capable of rotative adjustment each relatively to the arm on its shaft; and means for locking each of said beveled gears in adjusted position relatively to the arm on the shaft thereof.

3. In an Axminster loom, the combination with the needle-cam; of a pair of rock-shafts at right angles to each other; a pair of intermeshing beveled gears keyed or otherwise permanently secured against rotation on the respective shafts; a pair of rocker-arms, one

of which is the needle-arm; means for securing each of said rocker-arms in different positions of angular adjustment upon one of said

5. In a device of the character described, a suitable casing hav-

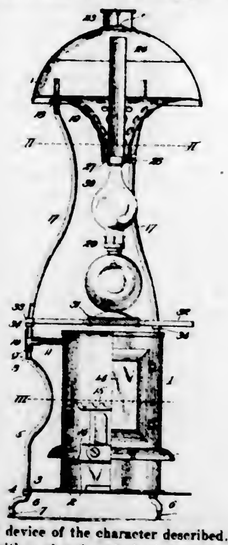
and ends, the ends being carried by the front and the front bein-

of which is the needle-arm; means for securing each of said rocker-arms in different positions of angular adjustment upon one of said rock-shafts; and a cam-follower on the other of said rocker-arms engageable with said cam.

4. In an Axminster loom, the combination with the needle-arm and the needle-cam; of a pair of rock-shafts at right angles to each other upon one of which is fixed the needle-arm; beveled gear connections between said rock-shafts; a rocker-arm capable of longitudinal adjustment upon the other of said rock-shafts; means for locking said rocker-arm in different positions of longitudinal adjustment upon its rock-shaft; and a cam-follower on said rocker-arm in engagement with said cam.

5. In an Axminster loom, the combination with the needle-arm and the needle-cam; of a pair of rock-shafts at right angles to each other upon one of which said needle-arm is fixed; a pair of intermeshing beveled gears on the respective rock-shafts; a rocker-arm fixed upon the other of said rock-shafts; and a pair of cam-followers mounted upon said rocker-arm engageable with opposing surfaces on said cam.

811,591. COMBINED HEATING AND ILLUMINATING DEVICE. SAMUEL S. ST. HOOR, Kansas City, Mo., assignor of one-fourth to William S. Cisgett and one-fourth to Mary H. Cisgett, Kansas City, Mo. Filed May 17, 1905. Serial No. 260,539.



Claim.—1. A device of the character described, comprising a casing provided with perforations in its lower portion, a suitable drum having its lower portion perforated, a conduit or pipeway communicating at its lower end with the upper portion of the casing and at its upper end with said drum, means for adjustably supporting the drum upon said pipeway or conduit, and means for heating the air in said drum.

2. A device of the character described, comprising a casing provided with perforations in its lower portion, a suitable drum having its lower portion perforated, a conduit or pipeway communicating at its lower end with the upper portion of the casing and at its upper end with said drum, and a heater within the casing.

3. A device of the character described, comprising a casing provided with perforations in its lower portion and with a door-controlled opening, a suitable drum having its lower portion perforated, a conduit or pipeway communicating at its lower end with the upper portion of the casing and at its upper end with said drum, and means for heating the air in said drum.

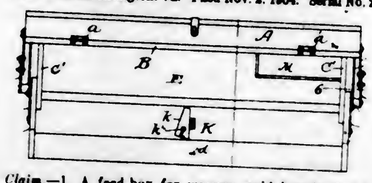
4. In a device of the character described, a suitable casing having its lower portion perforated, a drum suitably supported and having its lower portion perforated, a conduit or pipeway communicating at its lower end with the upper portion of the casing and at its upper end with the drum, a lamp suitably supported and having its chimney arranged to discharge into the drum, and an adjustable tube arranged within the drum and having its lower end externally embracing the upper end of the lamp-chimney.

5. In a device of the character described, a suitable casing having its lower portion perforated, a drum suitably supported and having its lower portion perforated, a conduit or pipeway communicating at its lower end with the upper portion of the casing and at its upper end with the drum, a lamp suitably supported and having its chimney arranged to discharge into the drum, a tube arranged within the drum and having its lower end externally embracing the upper end of the lamp-chimney, and a deflecting-bell suspended from the top of the drum and overhanging the upper end of said tube.

6. In a device of the character described, a casing having its lower portion perforated, a drum having its lower portion perforated, a plurality of conduits or pipeways communicating with the upper portion of the casing, and projecting upward into the drum, collars on the conduits or pipeways below the drum to support the latter, a lamp having its chimney arranged to discharge into the drum, and a support for the lamp above the casing and supported by said conduits or pipeways.

7. A device of the character described comprising a casing having a perforated bottom, a drum having a perforated bottom, pipes leading from the casing into the drum, a lamp supported by said pipes, and a tube adjustably secured in the bottom of the drum and passing up into the same and having its lower end encircling the top of the chimney of the lamp.

811,592. FEED-BOX. JOHN S. H. STONEBURNER and CHARLES D. STONEBURNER, Arlington, Va. Filed Nov. 2, 1904. Serial No. 231,171.



Claim.—1. A feed-box for wagons, said box having a back adapted to form an end-board of the wagon-body, and means carried by said back to enable the box to be applied to wagon-bodies of different widths, substantially as described.

2. A feed-box for wagons, said box having a back adapted to form an end-board of the wagon-body, and adjustable end portions carried by said back, whereby the box may be fitted to wagon-bodies of varying widths, substantially as described.

3. A feed-box for wagons, said box having a back adapted to form an end-board of the wagon-body, a sliding member at each end of the back having slots therethrough, a hooked plate extending across said slots, bolts extending through said back, slots, and plate, and nuts on said bolts for clamping said plate against the sliding member, substantially as described.

4. A feed-box having in combination a pivoted cover, a back, a bottom, a front and ends, said front being pivoted adjacent to the bottom of the box, and connections between said front and said cover for elevating the latter by the lowering of the front, said connections being adapted to rotate said cover and bring its free edge to the rear of a vertical line extending through the pivot thereof when the front is fully lowered, substantially as described.

5. A feed-box having in combination a pivoted cover, a back, a bottom, a front, and ends, said front being hinged to the bottom, and links connected to said front and said cover and adapted to rotate the cover to bring its free edge to the rear of a vertical line extending through the pivot thereof when the front is fully lowered, substantially as described.

6. A feed-box having in combination a back, a pivoted cover, a front, and ends, said ends being carried by the front and said front being pivoted to the bottom, links connecting the lower inner extremities of the ends and the cover and adapted to rotate the cover to bring its free edge to the rear of a vertical line extending through the pivot thereof when the front is fully lowered, substantially as described.

7. In a feed-box having in combination a back, a bottom, a pivoted cover, a front, and ends, said ends being carried by the front and said front being pivoted to the bottom, foldable links connecting the ends and the back of the box, and links connecting the lower inner extremities of the ends and the cover and adapted to rotate the cover to bring its free edge to the rear of a vertical line extending through the pivot thereof when the front is lowered to straighten said foldable links, substantially as described.

8. A feed-box having in combination a back, a bottom, a front, and ends, the ends being carried by the front and the front being hinged to the bottom, of transverse members extending from the back of the box to the front adjacent to the ends of the same, a plate secured to each of said members, said members being recessed back of said plate and said plate having an arc-shaped slot therein, a headed bolt extending through each of said ends and through said slot with the head in the recess between said plate and said member, and a nut for tightening said bolt whereby the members and ends may be kept in substantial contact, substantially as described.

9. A feed-box having in combination a back, a bottom, a front, and ends, said ends being carried by the front and said front being hinged to the bottom, a retaining-board extending longitudinally of the front from end to end of the same, said board being hinged to the front of the box, whereby it may be folded up when the box is closed, and means for supporting said board in an elevated position to retain the feed in the box when the front is lowered, substantially as described.

10. A feed-box having in combination, a back, a bottom, a front, and ends, said ends being carried by the front and the front being hinged to the bottom, a retaining-board carried by the front and extending from end to end of the same, said retaining-board being hinged to the front, whereby it may be folded down when the box is closed, a brace for said retaining-board, said brace being hinged to said board, a hook carried by said brace and an eye carried by the front board, whereby the brace may be supported in position to sustain the retaining-board in an elevated position when the front is lowered, substantially as described.

11. A feed-box having in combination a back, a bottom, a front, and ends, the ends being secured to the front and the front being hinged to the bottom, transverse members extending from the back to the front of the box when the latter is closed, said members being adjacent to the ends of the box, a retaining-board extending longitudinally of the front and hinged thereto whereby it may be folded down when the box is closed, and means for sustaining said board in an elevated position, the members being provided with a recessed portion or rabbet for the reception of said retaining-board when the box is closed, substantially as described.

12. A feed-box having in combination a back, a bottom, a front, and ends, the ends being carried by the front and the front being hinged to the bottom, transverse members adjacent to the ends and extending from the back of the box to the front of the same when the latter is closed, a canvas lining covering the bottom and front of the box, and means for retaining said members and ends in substantial contact substantially as described.

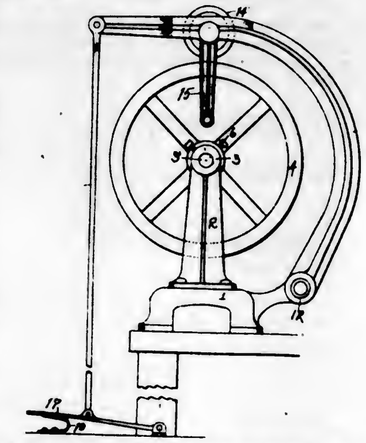
13. A feed-box having in combination a back, a bottom, a front, and ends, the ends being carried by the front and the front being hinged to the bottom, transverse members adjacent to said ends and extending from the back of the box to the front of the same when the latter is closed, a retaining-board extending the length of the box and hinged to said front whereby it may be folded down when the front is closed, and a canvas lining covering the bottom and front of the box and the surface of the retaining-board which folds down against said front, substantially as described.

14. A feed-box having in combination a back, a bottom, a front, ends, and a cover, said cover being hinged to the upper portion of the box and said front being hinged to the bottom and carrying said ends, transverse members adjacent to the ends and extending from the back to the front of the box when the latter is closed, means carried by said ends and in sliding engagement with said members for holding said ends and members in contact during the opening and closing movement of the front, a link connected to said means and said cover for raising said cover when the front is lowered, said link being adapted to rotate the cover to bring its free edge beyond the hinges thereof when the front is fully lowered, substantially as described.

811,593. CYLINDRICAL-BOX TRIMMER. WILLIAM H. STOUT, Dayton, Ohio. Filed June 9, 1905. Serial No. 264,393.

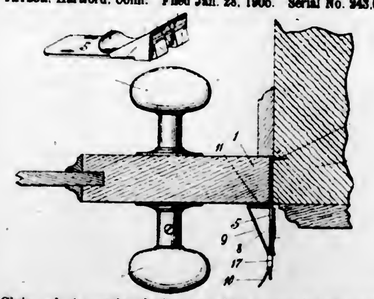
Claim.—1. In a cylindrical-box trimmer, the combination of a spindle having blank wheels thereon which support the box-cylinder, one of said wheels being adjustable to accommodate different depths of boxes, a swinging frame supporting a cutter, means for lowering said frame to bring the cutter in an operative position, and means for revolving the cutter while held in such position.

2. In a cylindrical-box trimmer, a spindle having bearings at one end, blank wheels on said spindle on one side of the bearings, one of said blank wheels being adjustable, and the other of said blank wheels having an embedded wooden rim, a swinging frame supporting a cutter, said cutter being in alinement with the wheel having the wooden rim, means for holding the swinging frame in an operative position for the cutter, and means for operating the cutter while the frame is so held, said cutter in its revolutions rotating the box-cylinder.



3. In a cylindrical-box trimmer, the combination with a spindle supported at one end on a standard, means upon said spindle for supporting a box to be trimmed, a swinging frame having its lower end hinged to the base, said swinging frame having a suitable curvature to clear the box, and the upper end of said swinging frame projecting forwardly, a foot-treadle connected to said upper end whereby the said frame may be lowered in its position, a revolving cutter supported in said frame in a position above the box, and means for revolving said cutter to trim the box.

811,594. DEVICE FOR SECURING DOORS, &c. CHARLES G. TAYLOR, Hartford, Conn. Filed Jan. 28, 1905. Serial No. 243,064.



Claim.—1. A securing device comprising a plate having an opening, and adapted to be secured to part of the support of a closure; a stop or abutment movable upon said plate, and having a finger-grasp; means on said finger-grasp for entering said opening and locking said stop or abutment after it has been placed in position; and a spring rigid with the stop or abutment, and bearing against the plate.

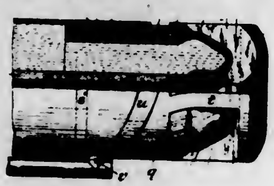
2. A securing device comprising a slotted plate; means for securing said plate to the jamb of a door; a stop or abutment shaped to fit the plate, and provided with a finger-grasp on one side, and with a spring on the other side; and a locking-lug carried by the finger-grasp, and adapted to enter the slot of said plate.

3. A securing device consisting of a plate having spikes or prods adapted to be driven in the jamb of a door; a reversible stop or abutment upon said plate, and having a tongue adapted to enter the space between the prods; and means for attaching said stop or abutment to, and detaching it from, said plate.

4. A securing device comprising a plate adapted to be secured to a door-jamb, said plate having pairs of slots; a reversible stop or abutment mounted for sliding movement upon the plate and provided with lugs entering the slots, and means for causing said lugs to

snap into the slots when the stop is adjusted to its desired position, and also when it is reversed to cause said stop or abutment to cover the inner sides of the prods.

811,595. GAS-OPERATED MECHANISM FOR FIREARMS. CHARLES H. TAYLOR, Philadelphia, Pa., assignor, by mesne assignments, to KNOX TAYLOR, Highbridge, N. J. Filed Mar. 30, 1901. Renewed May 24, 1905. Serial No. 262,055.



Claim.—1. The combination with a gun of a turbine actuated by the escaping gases of combustion, a reciprocating part and means whereby said reciprocating part is actuated by said turbine, substantially as described.

2. The combination with a gun of a rotatable attachment provided with vanes arranged spirally to the path of the escaping gases of combustion, a reciprocating part and operative connections between said attachment and said reciprocating part whereby said reciprocating part is actuated by said attachment, substantially as described.

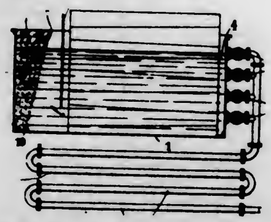
3. The combination with a gun, of a turbine attachment comprising a casing having surfaces arranged to deflect rearwardly the escaping gases of combustion and vanes actuated by the gases, whereby the gases react to check the recoil.

4. The combination with a gun having a water-jacket of an end piece or cup secured in the end of the water-jacket and forming a seat for an external bearing and a rotatable part mounted in said bearing.

5. The combination with a gun having a water-jacket, of a turbine actuated by the escaping gases and having a bearing on said water-jacket and a gun mechanism operated by said turbine.

6. The combination with a gun having a water-jacket, of an end piece or cup secured in the end of the water-jacket, a turbine actuated by the escaping gases and having a bearing on said end piece or cup and a gun mechanism operated by said turbine.

811,596. REFRIGERATING APPARATUS FOR COOLING AIR. VICTOR TRADING, Vienna, Austria-Hungary. Filed Mar. 26, 1904. Serial No. 200,623.

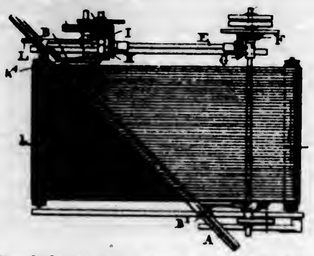


Claim.—1. A refrigerating apparatus comprising a receptacle, a perforated partition 6 separating the receptacle into two chambers, one adapted to receive solid saline material and the other a solution of the same, a vertically-adjustable partition in the latter compartment so that upon raising or lowering the partition the strength of the liquid on one side of the partition may be varied, and means for drawing off the liquid at different heights.

2. A refrigerator comprising a receptacle and a perforated partition pivoted to the bottom thereof and extending upwardly so as to divide said receptacle into two compartments adjustable as to their relative size.

3. A refrigerator comprising a receptacle and a partition pivotally connected to the bottom thereof, said partition being perforated and extending at an inclination to form a salt-chamber and an ice-chamber whereby the liquid resulting from the melting ice in rising in the two chambers renders variable the relative quantity of salt and ice which is effective, substantially as described.

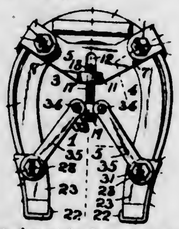
811,597. LOOM. FRANÇOISE VOLAND, Villeurbanne, LOUIS DIRBERGER, Jallieu, and JEAN B. MONNET, Bourgoin, France. Filed June 9, 1905. Serial No. 264,494.



Claim.—1. In a loom for weaving fabrics of inclined texture the combination of a batten inclined to the direction of the warp and means for reciprocating said batten in a direction parallel to that of the warp-threads comprising a driving-shaft, rods of equal length connected to the batten and means whereby one of said rods is driven directly and the other indirectly from said driving-shaft substantially as described.

2. In a loom for weaving fabrics of inclined texture the combination of a batten inclined to the direction of the warp and means for reciprocating said batten in a direction parallel to that of the warp-threads comprising a driving-shaft, rods of equal length connected to the batten, crank mechanism adapted to drive one of said rods directly from the shaft, and bevel gear and crank mechanism intermediate the shaft and the other rod for driving the latter indirectly from said shaft substantially as described.

811,598. ATTACHMENT OR FIXTURE FOR HORSESHOES. JOHN W. TOWNSEND and NELSON S. TOWNSEND, Newark, N. J. Filed Jan. 12, 1905. Serial No. 240,693.



Claim.—1. An attachment for horseshoes to prevent slipping, comprising a forward retaining member consisting, essentially, of a main body having oppositely-extending end members, an upwardly-projecting retaining-lug upon each end member adapted to grasp the front portion of a horseshoe, each end member being provided with a screw-threaded receiving-hole, and a calk provided with a screw-shank screwed into each receiving-hole, a pair of rear retaining members arranged upon the heel ends of the shoe, each rear retaining member being provided with a screw-threaded receiving-hole, and a calk provided with a screw-shank screwed into each receiving-hole of a rear retaining member, a screw-threaded lug on the body of said forward retaining member, a screw-bolt in said screw-threaded lug, a cross-bar on said bolt, and connecting-links between the said bar and the rear retaining members, all arranged for drawing the said retaining members toward each other and securing the same in retaining positions upon the shoe, substantially as and for the purposes set forth.

2. In an attachment for horseshoes to prevent slipping, the combination, with a pair of rear retaining members, each member comprising a main body, a right-angled end piece and a web, all arranged to embrace the heel end of a horseshoe, of a forward retaining means consisting, essentially, of a main body having oppositely-extending end members, an upwardly-projecting retaining-lug upon each end member adapted to grasp the front portion of the shoe, a screw-threaded lug on the body of said forward retaining member, a screw-bolt in said screw-threaded lug, a cross-bar on said bolt, and connecting-links between the said bar and the rear retaining members, all arranged for drawing the said retaining members toward each other and securing the same in retaining positions upon the shoe, substantially as and for the purposes set forth.

3. In an attachment for horseshoes to prevent slipping, the combination, with a pair of rear retaining members, each member comprising a main body, a right-angled end piece, and a web, all arranged to embrace the heel end of a horseshoe, and a laterally-extending lug on said body, said lug being provided with a screw-threaded receiving-hole, of a calk provided with a screw-shank screwed into said receiving-hole, a forward retaining means adapted to grasp the forward end of the horseshoe, and means connected with said calks of the rear retaining members and with said forward retaining means for securing the same in position upon the shoe, substantially as and for the purposes set forth.

4. In an attachment for horseshoes to prevent slipping, the combination, with a pair of rear retaining members, each member comprising a main body, a right-angled end piece, and a web, all arranged to embrace the heel end of a horseshoe, and a laterally-extending lug on said body, said lug being provided with a screw-threaded receiving-hole, of a calk provided with a screw-shank screwed into said receiving-hole, a forward retaining means adapted to grasp the forward end of the horseshoe, and an adjusting means connected with said rear retaining members and said forward retaining means for drawing said rear retaining means toward said forward retaining means and securing the same in position upon the shoe, substantially as and for the purposes set forth.

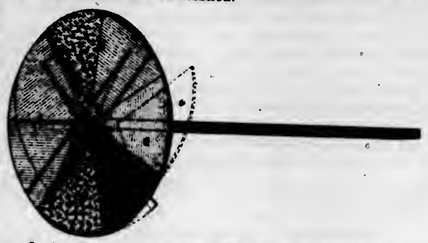
5. In an attachment for horseshoes to prevent slipping, the combination, with a pair of rear retaining members, each member comprising a main body, a right-angled end piece, and a web, all arranged to embrace the heel end of a horseshoe, and a laterally-extending lug on said body, said lug being provided with a screw-threaded receiving-hole, of a calk provided with a screw-shank screwed into said receiving-hole, a forward retaining means consisting, essentially, of a main body having oppositely-extending end members, an upwardly-projecting retaining-lug upon each end member adapted to grasp the front portion of the shoe, each end member being provided with a screw-threaded receiving-hole, and a calk having a screw-shank screwed in each receiving-hole, and a fastening means connected with the central portion of the body of said forward retaining means and with the calks of said rear retaining members for securing the same in position upon the shoe, substantially as and for the purposes set forth.

6. In an attachment for horseshoes to prevent slipping, the combination, with a pair of rear retaining members, each member comprising a main body, a right-angled end piece, and a web, all arranged to embrace the heel end of a horseshoe, and a laterally-extending lug on said body, said lug being provided with a screw-threaded receiving-hole, of a calk provided with a screw-shank screwed into said receiving-hole, a forward retaining means consisting, essentially, of a main body having oppositely-extending end members, an upwardly-projecting retaining-lug upon each end member adapted to grasp the front portion of the shoe, each end member being provided with a screw-threaded receiving-hole, and a calk having a screw-shank screwed in each receiving-hole, and a fastening means adjustably connected with the central portion of the body of said forward retaining means and with the calks of said rear retaining members for securing the same in position upon the shoe, substantially as and for the purposes set forth.

7. In an attachment for horseshoes to prevent slipping, the combination, with a pair of rear retaining members, each member comprising a main body, a right-angled end piece, and a web, all arranged to embrace the heel end of a horseshoe, and a laterally-extending lug on said body, said lug being provided with a screw-threaded receiving-hole, of a calk provided with a screw-shank screwed into said receiving-hole, a forward retaining means consisting, essentially, of a main body having oppositely-extending end members, an upwardly-projecting retaining-lug upon each end member adapted to grasp the front portion of the shoe, each end member being provided with a screw-threaded receiving-hole, and a calk having a screw-shank screwed into each receiving-hole, a screw-threaded lug on the body of said forward retaining means, a screw-bolt in said screw-threaded lug, a cross-bar on said bolt, and connecting-links connected with the ends of said cross-bar and with the calks of said rear retaining members, all arranged for drawing the said rear retaining members toward the forward retaining means for securing the same in position upon the shoe, substantially as and for the purposes set forth.

811,599. MOTOR-WHEEL. ISAAC J. TURNER, New York, N. Y., assignor to Leander T. Chamberlain, New York, N. Y. Filed June 24, 1904. Serial No. 214,067.

Claim.—1. A rotative wheel comprising vanes normally tending to lie in a common plane at right angles to the axis of rotation, each vane having a flexible connection with the body of the wheel adjacent the circumference, and being disposed in part between such connection and the axis of rotation.



2. A rotative wheel formed from a single sheet of material, and comprising vanes having flexible connections adjacent the circumference of the wheel, and each disposed in part between such connection and the axis of rotation.

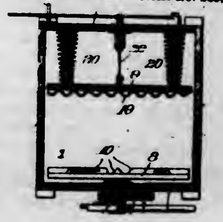
811,600. COMBINED WEEDER, ORCHARD-CULTIVATOR, AND FALLOW-PLOW. WILLIAM TURNER, Wenatchee, Wash. Filed Sept. 5, 1905. Serial No. 277,088.

Claim.—1. In a weeder the combination of a longitudinal beam, an axle connected to one end of the beam and provided with an arched portion, a wheel-frame adjustably connected to the opposite end of the beam, cutting-knives supported by the beam, a seat mounted upon the axle, a brace connecting the seat and the longitudinal beam, a lever mounted upon the brace, and a rod connecting the lever to the axle whereby the latter can be rotated to raise or lower the cutting-knives.

2. In a weeder, the combination of a longitudinal beam, cutting-knives supported by the beam, supporting-wheels at one end thereof, a sleeve at the opposite end thereof, a brace connecting the sleeve and the longitudinal beam, a lever mounted upon the brace, a shaft passing through the sleeve, a wheel-frame connected to the shaft, and a link connecting the lever and the shaft whereby the latter can be vertically adjusted with respect to the longitudinal beam.

3. In a weeder, the combination of a longitudinal beam, cutting-knives supported by the beam, an axle connected to the rear end of the beam and having an arched formation, a sleeve connected to the opposite end of the beam, a brace for the sleeve, a lever mounted upon said brace, a shaft passing through the sleeve, a wheel-frame connected to the shaft, a link connecting the shaft and the lever whereby the former may be vertically adjusted with respect to the longitudinal beam, a seat supported upon the rear axle, a brace for said seat, a lever mounted upon said brace, and a link member connecting the lever and the axle whereby the latter may be rotated to adjust the height of the cutting-knives.

811,601. WASHING-MACHINE. VILLIAM I. WALKER, Council Bluffs, Iowa. Filed June 2, 1905. Serial No. 263,389.



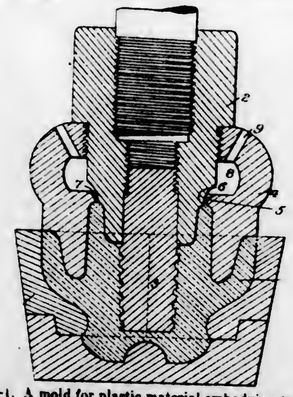
Claim.—1. In a washing-machine, in combination, two rubbing-boards; means for causing a rubbing action between said boards, one of said boards being yieldingly mounted; means for adjusting the range of movement of said yieldingly-mounted board; and means for locking said adjusting means.

2. In a washing-machine, in combination, a rotatable rubbing-board; means for rotating said board alternately in opposite directions; a yieldingly-mounted rubbing-board; means for adjusting the range of movement of said yieldingly-mounted board; and means for locking said adjusting means.

3. In a washing-machine, in combination, a rotatable rubbing-board; means for rotating said board; a yieldingly-mounted rubbing-board; means for adjusting the range of movement of said yieldingly-mounted board; a pivoted lever; a flexible connection between said lever and said yieldingly-mounted rubbing-board; and means for locking said lever in a predetermined position.

4. In a washing-machine, in combination, a suds-box; a rotatable rubbing-board; means for rotating said board; a rubbing-board slidably supported upon the bottom of said suds-box; a plurality of springs tending to move said last-mentioned rubbing-board toward said rotatable rubbing-board; and means for adjusting the range of movement of said spring-pressed rubbing-board.

811,602. MOLD FOR PLASTIC MATERIALS. ARTHUR S. WATTS, Victor, N. Y., assignor to The Locke Insulator Manufacturing Company, Victor, N. Y., a Corporation of New York. Filed Sept. 29, 1905. Serial No. 280,636.



Claim.—1. A mold for plastic material embodying two cooperating members between which the plastic material is pressed, one of said members having an annular recess for forming a flange on the molded article and a narrow annular passage at the bottom of said recess for permitting the passage of air.

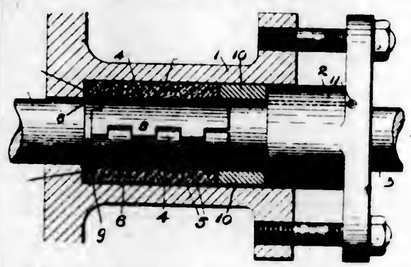
2. A mold for forming insulators from plastic materials embodying two cooperating members between which the material is pressed, one of said members having the annular recess for forming a petticoat on the insulator and a narrow annular passage at the extreme bottom of said recess for permitting the exit of air and an exceedingly narrow film of the material being molded, and the other mold member forming the exterior of the insulator.

3. A mold for forming insulators from plastic material embodying a member by which the material is pressed, said member having an annular shoulder thereon and having an outer annular section provided with a shoulder thereon corresponding to the first-mentioned shoulder to mold the edge of an insulator-petticoat and a narrow annular channel between said shoulders through which the air and a film of plastic material narrower than the petticoat may escape.

4. In a mold for forming insulators from plastic materials, the combination with a head provided with the annular shoulder 6, and a threaded projection extending beyond it, of an outer removable section 4 provided with an annular shoulder 5 corresponding to the shoulder 6, and separated therefrom by a narrow channel 7.

5. The combination with the mold-head having the shoulder 6, the projection 3 secured in the end of the head and having the exterior threaded portion, of the annular member 4 secured to the exterior of the head provided with the shoulder 5 arranged in close proximity to the shoulder 6 on the head to form a narrow passage 7 and the annular chamber 8.

811,603. PISTON-ROD PACKING. PHILO H. WEAVER, Pittsburg, Pa. Filed Mar. 17, 1905. Serial No. 250,527.



Claim.—1. In a piston-rod packing, the combination with the stuffing-box the gland and piston-rod, of a pair of metal sleeve members of approximate semicircular form in cross-section arranged within said stuffing-box around the said piston-rod and interlocking with one another by circumferentially-disposed laterally-engaging tongues, a soft packing in said stuffing-box surrounding the inner major part of said sleeve members, and a divided follower arranged over the outer end of said members between the soft packing and gland, as shown and set forth.

2. In a piston-rod packing, the combination with the stuffing-box the gland and piston-rod, of a metal sleeve arranged in said stuffing-box around said rod and longitudinally divided into two parts or sections interlocking with one another by circumferentially-disposed laterally-engaging tongues, a soft packing within said stuffing-box and surrounding the inner major part of said sleeve, a divided follower-ring arranged over the outer end of said tube between said soft stuffing and gland, and projections carried by the inner ends of said sleeve-sections to extend up into the stuffing-box, as shown and set forth.

3. In a piston-rod packing, the combination with the stuffing-box the gland and piston-rod, of a metal sleeve arranged in said stuffing-box around said rod and longitudinally divided into two parts or sections interlocking with one another by circumferentially-disposed laterally-engaging tongues, offsets formed in the inner ends of each of said tubular sections, segmental gibs engaging at their heads in said offsets, a soft packing within said stuffing-box surrounding the inner major part of said sleeve, and a divided follower-ring arranged over the end of said tube between the soft packing and gland, as shown and set forth.

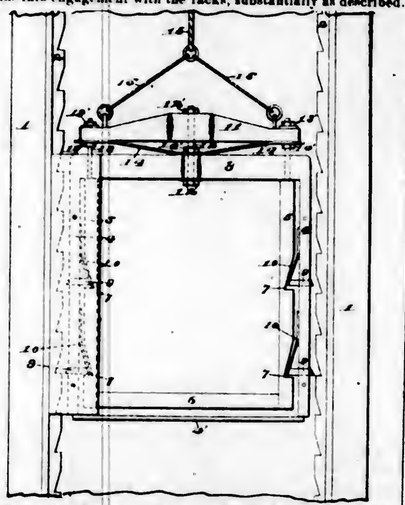
4. In a piston-rod packing, the combination with the stuffing-box the gland and piston-rod, of a metal sleeve arranged in said stuffing-box around said rod and longitudinally divided into two parts or sections interlocking with one another by circumferentially-disposed laterally-engaging tongues, offsets formed in the inner ends of said tubular sections, segmental gibs engaging at their heads in said offsets, a soft packing within said stuffing-box surrounding the inner major part of said sleeve, a divided follower-ring arranged over the outer end of said tube between the soft packing and gland, and projections carried by the inner ends of said sleeve-sections to extend up into the stuffing-box, as shown and set forth.

5. In a piston-rod packing, the combination with the stuffing-box the piston-rod and gland, of a pair of metal sleeve members of approximate semicircular form in cross-section arranged within said stuffing-box around the said piston-rod and interlocking with one another by circumferentially-disposed laterally-engaging tongues, a soft packing in said stuffing-box surrounding the inner major part of said sleeve members, a divided follower arranged over the outer ends of said sleeve members between the said soft packing and gland, and an oil-opening extending through the cylindrical part of the gland to the interior of the stuffing-box, as shown and set forth.

6. In a piston-rod packing, the combination with the stuffing-box and rod, of a pair of sleeve members of approximately semicircular form in cross-section arranged within said stuffing-box around the said piston-rod and interlocking with one another by circumferentially-disposed laterally-engaging tongues, a soft packing within said stuffing-box and surrounding the inner major part of said sleeve members, and a gland on said rod and protruding into said box to compress the soft packing, as shown and set forth.

811,604. SAFETY DEVICE FOR ELEVATORS. FREDERICK A. WHEEL, Florello, Pa. Filed Apr. 26, 1904. Serial No. 206,317.

Claim.—1. In a safety device for elevators, the combination with racks provided in the side walls of the elevator-shaft, of an outer frame or cage having a top, side walls and bottom, an inner cage adapted to operate therein, spring-actuated locking-pins mounted for horizontal movement in the side walls of the outer cage adapted to engage with the racks, said inner cage adapted to force the locking-pins into engagement with the racks, substantially as described.



2. In a safety device for elevators, the combination of an outer frame or cage having a top beam, side walls and a bottom, an inner cage adapted to operate therein, spring-actuated locking-pins mounted for horizontal movement in the walls of the outer cage, racks formed in the side walls of the elevator-shaft, said pins being adapted to be forced into engagement with the racks by the inner cage and guide-plates secured to the side of said walls, substantially as described.

3. In a device for elevators, the combination with the outer frame or cage having a top beam, side walls and bottom, of an operating-beam adjustably seated on said top beam, a spring mounted between the operating-beam and the top beam, uprights suspended from the operating-beam extending downwardly through the top beam of the cage supporting a platform at the lower end thereof and being provided with angled recesses, spring-actuated pins mounted in the walls of the outer cage, racks mounted in the elevator-shaft, said pins being adapted to be operated by the walls of the recesses of the uprights upon movement of the same, substantially as described.

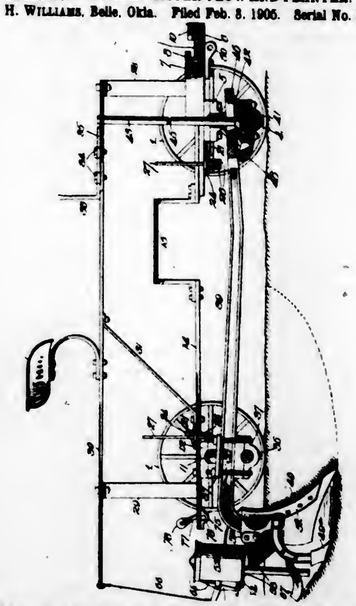
811,605. PLATE FOR SOLES AND HEELS OF SHOES. MANSFIELD M. WEST, Cleveland, Ohio. Filed Oct. 19, 1904. Serial No. 229,060.

Claim.—1. A plate for heels and soles of shoes, said plate comprising an elongated continuous outer edge portion curved to correspond to the contour of the heel or sole to which the plate is to be applied, a rounded shoulder or extension at each end of such outer portion, said shoulder extending inwardly a sufficient distance to clear the row of nails adjacent the edge of the heel or sole and having at the inner edge thereof a prong, and a portion intermediate of said shoulders and extending inwardly a greater distance than said shoulders and having at the inner extremity thereof a prong, substantially as specified.

2. A sheet-metal plate for heels and soles of shoes, said plate comprising a continuous curved outer portion corresponding in contour to the edge of the heel or sole to which the plate is to be applied, said plate being curved or deflected at the outer edge thereof from the plane of the main bearing-surface and being provided with a rounded shoulder at each end thereof projecting inwardly and provided with a prong for securing the same to the heel or sole, substantially as specified.

3. A plate for heels and soles of shoes, said plate comprising a continuous curved portion corresponding in contour to the edge of the heel or sole to which the plate is to be applied and having adjacent each end thereof a prong set in from the outer edge of the plate and a row of projections parallel with the outer curved edge of the plate and between the said prongs and said outer edge, the plate being curved or deflected from the plane of the main bearing-surface, such curve or deflection extending from said row of projections to the outer edge of the plate, substantially as specified.

811,606. COMBINED LISTER-PLOW AND PLANTER. WILLIAM H. WILLIAMS, Belle, Okla. Filed Feb. 8, 1905. Serial No. 244,799.



Claim.—1. In an agricultural machine, a carrying-frame, a crank-axle mounted thereon, a lister-plow journaled upon said crank-axle, and means to revolve said axle and cause the plow to make a furrow which tapers toward its ends.

2. In an agricultural machine, a carrying-frame, a crank-axle mounted thereon, a lister-plow journaled upon said crank-axle, and means for causing the movement of the machine to simultaneously revolve the plow.

3. In an agricultural machine, the combination of a carrying-frame, wheels supporting the rear end of the same, a crank-axles for said wheels, means to revolve the axle, a plow journaled on the crank of said axle, and means to tilt the plow up and down alternately as the plow respectively rises and descends with the crank.

4. In an agricultural machine, a suitable frame, a support for the front end of the frame, which is capable of turning, wheels supporting the rear end of the frame, a crank-axle for said wheels, a boxing on said crank-axle, a plow secured to the boxing and having the front end of its beam longitudinally slotted, and a rod or bolt extending through said slot.

5. In an agricultural machine, a semicircular frame, a crank-axle journaled therein, wheels journaled upon the ends of the crank-axle, clutch mechanism to lock said wheels rigid with the crank-axle, a frame engaging the semicircular frame and having a relative rotatable movement thereon to permit the front wheels to turn, a crank-axle journaled on the second frame, wheels journaled on said axle, clutch mechanism to throw said wheels in rigid relation with said axle, boxings journaled on said crank-axles, and a plow having its beam rigidly secured to the rear boxing and adapted to rest upon the front boxing.

6. In an agricultural machine a semicircular frame, a crank-axle journaled therein, wheels journaled upon the ends of the crank-

axle, clutch mechanism to lock said wheels rigid with the crank-axle, a frame engaging the semicircular frame and having a relative rotatable movement thereon to permit the front wheels to turn, a crank-axle journaled on the second frame, wheels journaled on said axle, clutch mechanism to throw said wheels in rigid relation with said axle, boxings journaled on said crank-axles, a plow having its beam rigidly secured to the rear boxing and adapted to rest upon the front boxing and having its front end slotted, a rod or bolt projecting from the front boxing up through said slot, a guide for the upper end of said rod, and arms projecting forwardly from the front crank to raise the front end of the beam more rapidly than the rear end is raised and thus tilt the plow-point upwardly.

7. In an agricultural machine a semicircular frame, a crank-axle journaled therein, wheels journaled upon the ends of the crank-axle, clutch mechanism to lock said wheels rigid with the crank-axle, a frame engaging the semicircular frame and having a relative rotatable movement thereon to permit the front wheels to turn, a crank-axle journaled on the second frame, wheels journaled on said axle, clutch mechanism to throw said wheels in rigid relation with said axle, boxings journaled on said crank-axles, a plow having its beam rigidly secured to the rear boxing and adapted to rest upon the front boxing and having its front end slotted, a rod or bolt projecting from the front boxing up through said slot, a guide for the upper end of said rod, arms projecting forwardly from the front crank to raise the front end of the beam more rapidly than the rear end is raised and thus tilt the plow-point upwardly, and means for locking the crank-axles at their highest point of movement.

8. In an agricultural machine, a carrying-frame, a crank-axle mounted thereon, a lister-plow journaled upon said crank-axle, means to revolve said axle and cause the plow to make a substantially segmental furrow in the ground, a seedbox movable with the plow and adapted to discharge seed rearward thereof, and means for effecting the discharge of the seed in each revolution of the plow.

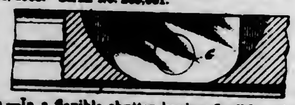
9. In an agricultural machine, a carrying-frame a crank-axle mounted thereon, a lister-plow journaled upon said crank-axle, means to revolve said axle and cause the plow to make a substantially segmental furrow in the ground, a seedbox movable with the plow and adapted to discharge seed rearward thereof, means for effecting the discharge of the seed in each revolution of the plow, and coverers also movable with the plow to cover the seed dropped by the seedbox.

10. In an agricultural machine, a carrying-frame, a crank-axle mounted thereon, means for revolving the crank-axle, a plow-beam pivoted on said crank, a plow pivotally suspended from said beam, and a pivoted brace connecting the plow structure and framework.

11. In an agricultural machine, a carrying-frame, a crank-axle mounted thereon, a plow-beam pivoted on said crank, a plow pivotally suspended from said beam, and a pair of forwardly-diverging braces pivoted at their rear ends to the plow structure and at their front ends to the carrying-frame.

12. In an agricultural machine, a suitable frame, a support for the front end of the frame, which is capable of turning, wheels supporting the rear end of the frame, a revoluble crank-axle for the wheels, a plow-beam pendently supported from the crank-axle and having a longitudinally-slidable connection at its front end with the support for the front end of the frame, and a plow secured rigidly to the rear portion of the beam.

811,607. **SHUTTER.** JAMES G. WILSON, Larchmont, N. Y. Filed July 14, 1905. Serial No. 269,691.

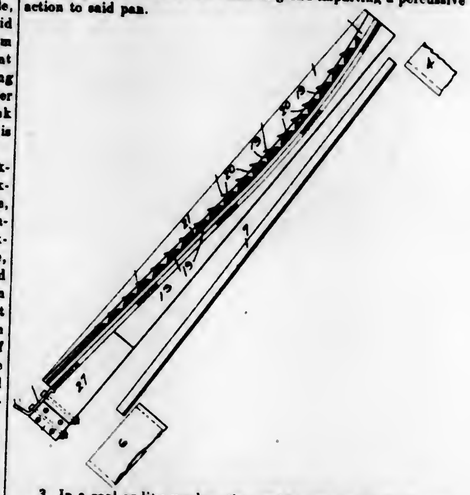


Claim.—In a flexible shutter having flexibly-united slats, the solid-shutter slat B having a narrow slit F running in the direction of its length, an opening G at substantially right angles to said slit and in registry therewith, and a piece of transparent material arranged in said slit to close said opening.

811,608. **COAL AND LIKE WASHER.** WILLIAM E. WINN, Pittsburg, Pa., assignor to Heyl & Patterson, Inc., Pittsburg, Pa., a Corporation of Pennsylvania. Filed Feb. 18, 1905. Serial No. 246,263.

Claim.—1. In a coal or like washer, the combination of a suitable pan having a riffled bottom, a series of freely-movable riffles in said bottom, and means for oscillating and imparting a percussive action to said pan.

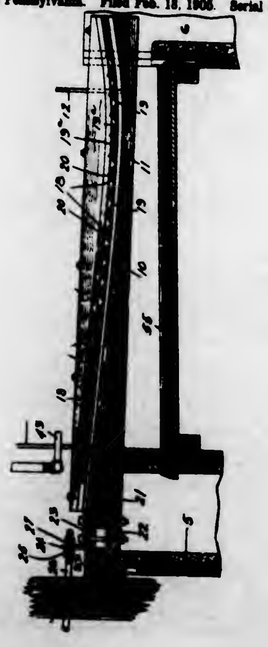
2. In a coal or like washer, the combination of a suitable pan having a riffled bottom, a series of loose riffles alternating with stationary riffles, and means for oscillating and imparting a percussive action to said pan.



3. In a coal or like washer, the combination of a suitable pan having a riffled bottom, a series of loose riffles alternating with stationary riffles within the zone of fine impurities, and means for oscillating and imparting a percussive action to said pan.

4. In a coal or like washer, the combination of a suitable pan having a single curved bottom formed of riffles parallel with each other and having openings between the same, said openings being sufficiently small to retain a body of water within said pan during the washing operation, and means for oscillating and imparting a percussive action to said pan.

811,609. **COAL AND LIKE WASHER.** WILLIAM E. WINN, Pittsburg, Pa., assignor to Heyl & Patterson, Inc., Pittsburg, Pa., a Corporation of Pennsylvania. Filed Feb. 18, 1905. Serial No. 246,264.



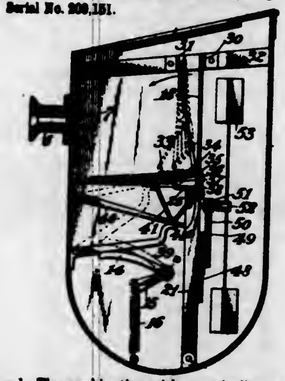
Claim.—1. In a coal or like washer, the combination of a suitable pan, a series of riffles forming the bottom of said pan with intervening spaces gradually diminishing in size toward the tail end of said pan, and means for oscillating and imparting a percussive action to said pan.

2. In a coal or like washer, the combination of a suitable pan, a series of riffles forming the bottom of said pan with intervening spaces within the zone of fine impurities, said spaces gradually diminishing in size toward the tail end of said pan, and means for oscillating and imparting a percussive action to said pan.

3. In a coal or like washer, the combination of a suitable pan, riffles forming the bottom of said pan, the riffles at the head of said pan having no intervening spaces, the riffles toward the tail end having intervening spaces gradually diminishing toward the tail end, and means for oscillating and imparting a percussive action to said pan.

4. In a coal or like washer, the combination of a suitable pan, riffles forming the bottom of said pan, the riffles at the head of said pan having no intervening spaces and with single inclined faces, the riffles at the tail of said pan having double inclined faces with intervening spaces gradually diminishing toward the tail end, and means for oscillating and imparting a percussive action to said pan.

811,610. **APPARATUS FOR DISPLAYING PICTURES.** STEFAN ŁACHER and EDWARD O. GOTTLIEB, New York, N. Y. Filed May 22, 1904. Serial No. 209,151.



Claim.—1. The combination with a vertically-movable picture-supporting frame, capable of swinging movement, and a stop for limiting the forward movement of said frame, of picture-holders pivoted at different elevations to said frame and means for swinging said picture-holders to their upright positions and for afterward swinging and bodily elevating said frame so that the pictures carried thereby may assume positions behind said stop, as and for the purpose set forth.

2. The combination with a vertically-movable picture-supporting frame, capable of swinging movement, and a pair of stops between which said frame is adapted to swing, of picture-holders pivoted at different elevations to said frame and means for swinging said picture-holders to their upright positions and for afterward swinging and bodily moving said frame so that the pictures carried by said holders may assume positions between said stops, as and for the purpose set forth.

3. The combination with a vertically-movable picture-supporting frame, capable of swinging movement, and having a pair of supporting-flanges at its side ends, and a stop for limiting the forward movement of said frame, of picture-holders pivoted at different elevations to said flanges, and means for swinging said picture-holders to their upright positions and for afterward swinging and bodily elevating said frame, so that the pictures carried by said holders may assume positions behind said stop, as and for the purpose set forth.

4. The combination with a vertically-movable picture-supporting frame, capable of swinging movement, and a stop for limiting the forward movement of said frame, of picture-holders pivoted at different elevations to said frame, means for swinging said picture-holders to their upright positions and for afterward swinging and bodily elevating said frame so that the pictures carried by said holders may assume positions behind said stop and means for retarding the return movement of said frame to its normal position, as and for the purpose set forth.

5. The combination with a vertically-movable picture-supporting frame, capable of swinging movement, and a stop for limiting the forward movement of said frame, of picture-holders pivoted at different elevations to said frame, a lever fulcrumed to said frame and adapted to engage the lowermost of said picture-holders and means for rocking said lever, whereby said picture-holders are raised to their upright positions, said frame is rocked and bodily elevated and the pictures carried by said holders are caused to assume positions behind said stop, as and for the purpose set forth.

6. The combination with a vertically-movable picture-supporting frame, capable of swinging movement, and a stop for limiting the forward movement of said frame, of picture-holders pivoted at different elevations to said frame, an elbow-lever fulcrumed to said frame and having its free end adapted to engage the lowermost of said holders, means for limiting the dowaward movement of said lever and means for causing the upward movement of said lever, whereby said picture-holders are raised to their upright positions, said frame is rocked and bodily elevated and the pictures carried by said holders are caused to assume positions behind said stop, as and for the purpose set forth.

7. The combination with a picture-supporting frame comprising a pivoted member and a vertically-movable slide thereon, and a stop for limiting the forward swinging movement of said frame, of picture-holders pivoted at different elevations to said slide, and means for swinging said holders to their upright positions and for afterward elevating said slide, so that the pictures carried by said holders will assume a position behind said stop, as and for the purpose set forth.

8. The combination with a picture-supporting frame comprising a pivoted member and a vertically-movable slide thereon, and a stop for limiting the forward swinging movement of said frame, of picture-holders pivoted at different elevations to said slide, means for swinging said holders to their upright positions and for afterward elevating said slide, so that the pictures carried by said holders will assume a position behind said stop, and means for retarding the return movement of said slide, as and for the purpose set forth.

9. The combination with an operating-shaft, of a picture-supporting frame comprising a pivoted member and a vertically-movable slide thereon, a stop for limiting the forward movement of said frame, picture-holders pivoted at different elevations to said slide, and means thrown into operation by said shaft for swinging said holders to their upright positions and for afterward swinging said frame and bodily elevating said slide, whereby the pictures carried by said holders are caused to assume positions behind said stop, as and for the purpose set forth.

10. The combination with an operating-shaft, of a picture-supporting frame comprising a pivoted member and a vertically-movable slide thereon, a stop for limiting the forward movement of said frame, picture-holders pivoted at different elevations to said slide, means thrown into operation by said shaft for swinging said holders to their upright positions and for afterward swinging said frame and bodily elevating said slide, whereby the pictures carried by said holders are caused to assume positions behind said stop, and means for retarding the return movement of said slide, as and for the purpose set forth.

11. The combination with a picture-supporting frame comprising a plate pivoted at its lower end, and a vertically-movable slide thereon, the said slide being provided with a cross-head having forwardly-extending flanges thereon, constituting supports, and a stop for limiting the forward swinging movement of said frame, of picture-holders pivoted at different elevations to said supports, a lever fulcrumed to said slide and adapted to engage the lowermost of said holders, and means for rocking said lever upwardly, whereby said picture-holders are moved to their upright positions, said plate is rocked rearwardly on its pivot and said slide is bodily elevated so that the pictures carried by said holders will assume a position behind said stop, as and for the purpose set forth.

12. The combination with a picture-supporting frame comprising a plate pivoted at its lower end, and a vertically-movable slide thereon, the said slide being provided with a cross-head having forwardly-extending flanges thereon, constituting supports, and a stop for limiting the forward swinging movement of said frame, of picture-holders pivoted at different elevations to said supports, a lever fulcrumed to said slide and adapted to engage the lowermost of said holders, means for rocking said lever upwardly, whereby said picture-holders are moved to their upright positions, said plate is rocked rearwardly on its pivot and said slide is bodily elevated so that the pictures carried by said holders will assume a position behind said stop, and means for retarding return movement of said slide, as and for the purpose set forth.

13. The combination with a picture-supporting frame compris-

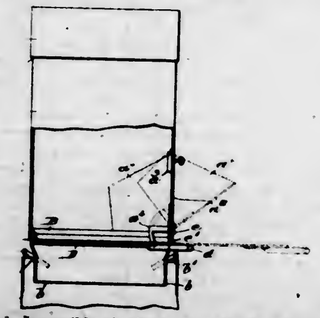
ing a plate pivoted at its lower end and a vertically-movable slide thereon, the said slide being provided with a cross-head having forwardly-extending flanges thereon, constituting supports, and a stop for limiting the forward swinging movement of said frame, of picture-holders pivoted at different elevations to said supports, an elbow-lever fulcrumed upon said slide whose free end is adapted to engage the lowermost of said holders, a stop for limiting the downward movement of said lever, and means for rocking said lever upwardly, whereby said holders are moved to their upright positions, said plate is moved rearwardly on its pivot and said slide is bodily elevated so that the pictures carried by said holders will assume a position behind said stop, as and for the purpose set forth.

14. The combination with a picture-supporting frame, comprising a plate pivotally mounted at its lower end and provided with side flanges, and a vertically-movable slide thereon, the said slide being provided with slotted side flanges which fit within the flanges on said plate, and also having a cross-head thereon provided with forwardly-extending flanges, constituting supports, and a pair of stops between which the upper end of said plate is adapted to swing, of picture-holders pivoted at different elevations to said supports, and means for moving said holders to their upright positions, for swinging said plate rearwardly and for elevating said slide so that the pictures carried by said holders will assume positions between said stops, as and for the purpose set forth.

15. The combination with a picture-supporting frame comprising a pivoted member and a vertically-movable slide thereon, and a stop for limiting the forward movement of said frame, of picture-holders pivoted at different elevations to said slide, means for moving said holders to their upright positions, for swinging said frame rearwardly and for elevating said slide so that the pictures carried by said holders will assume positions behind said stop, a rack carried by said slide, a pinion carried by said pivoted member and meshing with said rack, a fan-shaft, and a system of reducing gearing between said pinion and said fan-shaft, as and for the purpose set forth.

16. The combination with a picture-supporting frame, comprising a pivoted member and a vertically-movable slide thereon, and a stop for limiting the forward movement of said frame, of picture-holders pivoted at different elevations to said slide, an elbow-lever pivoted to said slide and adapted to engage the lowermost of said holders, a rock-shaft having an arm thereon, and connections between said arm and said elbow-lever, whereby when said shaft is rocked in one direction, said elbow-lever is raised, said picture-holders are moved to their upright positions, said frame is swung rearwardly and said slide is elevated so that the pictures carried by said holders are caused to assume a position behind said stop, as and for the purpose set forth.

811,611. STREET LETTER-BOX. ALBERT J. ARSENAULT, Boston, Mass. Filed July 3, 1905. Serial No. 268,081.



Claim.—1. In a mail-box having an opening in its lower end for the discharge of mail, a movable closure for said opening, a door closing an opening in the side of the box above the opening in the lower end thereof, and means carried by the door to lock the closure in closed position.

2. A mail-box having a movable bottom provided with an opening combined with a door having an attached locking device adapted to enter the opening in the movable bottom as the door is closed provided the movable bottom occupies its closed position.

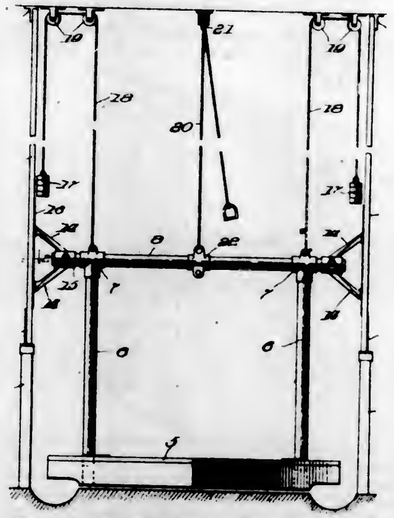
3. A mail-box having a lower open end, an open frame secured to said lower open end, a movable bottom for said frame, a door closing an opening in the side of the mail-box above the frame, and a locking device for the movable bottom, said locking device being connected to the door.

4. In a mail-box, a body having an opening in its lower end, and provided with a door carrying a locking device, and a bottom to close said lower open end, said bottom having a member coacting with the locking device to prevent the closing of the door until the bottom occupies its closed position.

5. A mail-box having an opening in its lower end for the discharge of mail, a movable closure for said opening, a door closing an opening in the box above the lower end thereof, and means carried by and movable with the door to engage the closure and lock the same in closed position.

6. A mail-box having an open lower end, an open frame detachably secured to the lower end of the mail-box, a movable bottom for said frame, a door closing an opening in the mail-box above the frame and a locking device carried by the door and movable therewith and adapted to engage the bottom and lock the same in closed position when the door is closed.

811,612. GUIDING MEANS FOR BOWLING-ALLEY PIN SPOTTERS OR SETTERS. CHARLES L. BASTIAN, Chicago, Ill. Filed Mar. 20, 1905. Serial No. 250,909.



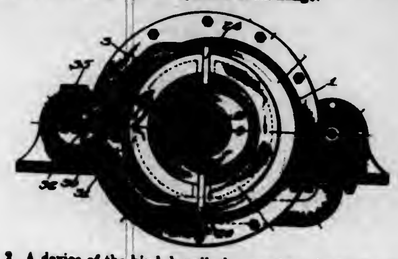
Claim.—1. The combination of a vertically-movable bowling-alley pin spotter or setter, uprights fastened thereto, a cross-rod fastened to said uprights, guides at the sides of the alley, and guide-brackets adjustably mounted on the ends of said cross-rod and arranged to travel in said guides.

2. The combination of a vertically-movable bowling-alley pin spotter or setter, uprights fastened thereto, a cross-rod, clamps fastening said cross-rod to said uprights, guides at the sides of the alley-guide-brackets adjustably mounted on the ends of said cross-rod, and shoes on said brackets arranged to travel against said guides.

3. The combination of a vertically-movable bowling-alley pin spotter or setter, uprights fastened thereto, a cross-rod, clampe fastening the cross-rod to the upper ends of the uprights, channel-guides extended upward from the kick-backs at the side of the alley, guide-brackets adjustably mounted on the ends of said cross-rod and comprising outwardly-diverging arms, and guide-shoes carried by said arms and traveling in said channel-guides.

811,613. ROTARY ENGINE. WILLIAM H. BATES, ROBERT C. DOUGLASS, and WILLIAM G. HOUSER, Chicago, Ill., assignors to The Marine Iron Works, Chicago, Ill., a Corporation of Illinois. Filed Mar. 22, 1905. Serial No. 251,482.

Claim.—1. A device of the kind described, comprising a cylinder provided with suitable ports, a liner adjustably mounted at each end of said cylinder, and a flange concentrically mounted upon each of said liners, in combination with a rotatable driver inclosing said flanges and eccentrically mounted to close the cylinder upon one side, and a plurality of unconnected pistons slidably mounted upon said driver and extending from the cylinder to the flanges.



2. A device of the kind described, comprising a cylinder provided with injection and ejection ports, in combination with a pair of fixed flanges concentrically mounted within the cylinder, a ring loosely inclosing each flange, friction-reducing means arranged between the flanges and the rings, a rotatable driver inclosing the flanges, and eccentrically mounted to close the cylinder upon one side, and a plurality of unconnected pistons slidably mounted upon the driver and extending from the cylinder to the flanges.

3. A device of the kind described, comprising a cylinder provided with injection and ejection ports, in combination with a pair of fixed flanges concentrically mounted within the cylinder, a ring loosely inclosing each flange, antifriction-rollers arranged between each flange and its ring, a rotatable driver inclosing the flanges, and eccentrically mounted to close the cylinder upon one side, and a plurality of unconnected pistons slidably mounted upon said driver and extending from the cylinder to the flange.

4. A device of the kind described, comprising a cylinder provided with suitable injection and ejection ports, in combination with a pair of fixed flanges concentrically mounted within the cylinder, a ring rotatably inclosing each flange, a rotatable driver inclosing the flanges, and eccentrically mounted to close said cylinder upon one side, and a plurality of unconnected pistons slidably mounted upon said driver and extending from the cylinder to the flanges.

5. A device of the kind described, comprising a cylinder provided with suitable ports, a pair of liners adjustably mounted at the ends of said cylinder, a flange formed upon each liner and concentrically fixed within the cylinder, in combination with a rotatable driver inclosing the flanges and eccentrically mounted to close the cylinder upon one side, a plurality of radial slots formed in the periphery of said driver, and unconnected pistons slidably mounted in said slots each closing the space between the cylinder and said flanges.

6. A device of the kind described, comprising a cylinder provided with suitable ports, a liner adjustably mounted at each end of said cylinder, and a flange provided upon each liner concentrically fixed within the cylinder, in combination with a rotatable driver inclosing said flanges and eccentrically mounted to close the cylinder at one side, a plurality of radial slots formed in the periphery of said driver, unconnected pistons slidably mounted in said slots, each closing the space between the cylinder and said flanges, and means arranged upon said driver at each of said slots to prevent the passage of fluid between said driver and said pistons.

7. A device of the kind described, comprising a cylinder provided with suitable ports, a liner adjustably mounted at each end of said cylinder, and a tubular flange provided upon each liner concentrically fixed within the cylinder, in combination with a rotatable driver inclosing the flanges and eccentrically mounted to close the cylinder upon one side, a plurality of radial slots formed in the periphery of said driver, unconnected pistons slidably mounted in said slots each closing the space between the cylinder and said flanges, one or more grooves formed in the walls of said slots near the periphery of said driver and packing-strips fitted into each of said grooves each adapted to resiliently press against a piston and prevent the passage of fluid radially in said slots.

8. A device of the kind described, comprising a cylinder provided with ports, a pair of flanges concentrically fixed within said cylinder and a plurality of rings rotatably mounted upon each flange, in combination with a rotatable driver inclosing said flanges and eccentrically mounted to close the cylinder upon one side, a plurality of pistons slidably mounted upon said driver, each piston provided with and resting upon a single ring on each flange and substantially filling the space between said rings and said cylinder.

9. A device of the kind described, comprising a cylinder provided with suitable ports having a head securely attached to each end, a liner adjustably supported upon each head and means for adjusting the position of said liner, and a tubular flange formed upon each liner, projecting into, and concentric with said cylinder, in combination with a rotatable driver inclosing said flanges and eccentrically mounted to close the cylinder at one side at a point between said ports, a plurality of unconnected pistons slidably mounted upon said driver and closing the space between said cylinder and said flanges.

10. A device of the kind described, comprising a cylinder an adjustable liner at each end of said cylinder, a plurality of flanges concentrically fixed upon each liner ports communicating with said cylinder and a valve to control said ports, in combination with a rotatable driver inclosing a pair of said flanges and eccentrically mounted to close the cylinder upon one side between said ports, a plurality of pistons slidably and radially mounted upon said driver, each closing the space between said cylinder and said flanges.

11. A device of the kind described, comprising a cylinder provided with suitable ports, a liner adjustably mounted at each end of said cylinder, a flange concentrically mounted upon each of said liners and a ring rotatably mounted upon each flange, in combination with a rotatable driver inclosing said flanges and eccentrically positioned in said cylinder to close the same at one side, and a plurality of unconnected pistons slidably mounted upon said driver and extending from the cylinder to the flanges.

12. A device of the kind described, comprising a cylinder provided with suitable ports, a liner adjustably mounted at each end of said cylinder, a plurality of flanges formed concentrically upon each of said liners, and a ring rotatably mounted upon one flange of each liner, in combination with a rotatable driver inclosing said flange and eccentrically positioned in said cylinder to close the same at one side, and a plurality of unconnected pistons slidably mounted upon said driver and extending from the cylinder to the flanges.

13. A device of the kind described, comprising a cylinder provided with suitable ports, a liner adjustably mounted at each end of said cylinder, a flange concentrically mounted upon each of said liners and a plurality of rings rotatably mounted upon each flange, in combination with a rotatable driver inclosing said flanges and eccentrically positioned in said cylinder to close the same at one side, and a plurality of pistons slidably mounted upon said driver, each piston provided with and resting upon a single ring on each flange and substantially filling the space between said rings and said cylinder.

14. A device of the kind described, comprising a cylinder provided with suitable ports, a liner adjustably mounted at each end of said cylinder, a plurality of flanges formed concentrically upon each liner, and a plurality of rings rotatably mounted upon each flange, in combination with a rotatable driver inclosing said rings, and eccentrically positioned in said cylinder to close the same at one side, and a plurality of pistons slidably mounted upon said driver, each piston provided with and resting upon a single ring on each flange and substantially filling the space between said rings and said cylinder.

15. A device of the kind described, comprising a cylinder provided with suitable ports, a liner adjustably mounted at each end of said cylinder, and means for adjusting the position of said liner, and a tubular member for each liner arranged within the cylinder, in combination with a rotatable driver inclosing said tubular members and eccentrically mounted to close the cylinder at a point between said parts, a plurality of pistons slidably mounted upon said driver and closing the space between said cylinder and said tubular member.

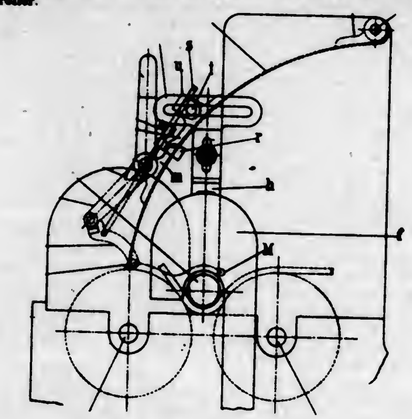
811,614. WINDING MECHANISM FOR COTTON-LAPS. CHARLES BERNARD, Hericourt, France. Filed Dec. 27, 1904. Serial No. 238,821.

Claim.—1. In a winding mechanism for cotton-laps, a protective device for the lap-roller comprising an adjustable metal guard over said lap-roller, an axle connected to said guard, a handle on said axle, lever mechanism at each end of said axle and a cross-bar attached to the ends of said lever mechanism, said device so arranged as to effect mechanically the insertion of the end of the lap under the lap-roller, substantially as set forth.

2. In a winding mechanism for cotton-laps, a pair of winding-rolls, a lap-roller adjacent to and between said rolls, a curved metallic perforated shield over said lap-roller, means for raising the shield concurrently with the lap-roller, and means for inserting mechanically the end of the lap underneath the lap-roller.

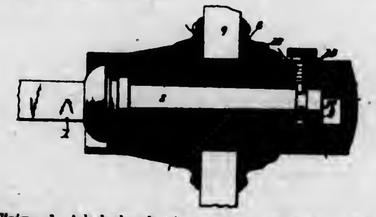
3. In a winding mechanism for cotton-laps, winding-rolls, a lap-roller, a shield above said lap-roller, a revoluble shaft on said shield, hand mechanism adapted to turn said shaft, jointed levers at the ends of said shaft, a cross-bar attached to the ends of said levers guide-bars attached to the lower parts of said levers adjustable rel-

lowers on said guide-bars, and curved cams adapted to guide the said cross-bar in a definite curved course and parallel to the lap-roller.



811,615. MEANS FOR LUBRICATING VEHICLE-WHEELS.

WILLIAM M. BOYD, Connersville, Ind., assignor of one-third to Chase Boyd and one-third to Ernest I. Boyd, Connersville, Ind. Filed May 29, 1905. Serial No. 262,579.



Claim.—1. A hub closed at its outer end and having a longitudinal bore, an axle-box seated in said bore and contacting with the bottom thereof, said hub and axle-box being apertured near their outer ends; a spindle engaging the axle-box and having an annular groove in registry with said apertures; and a tubular member extending through the apertures into the groove and having a closure at its outer end.

2. A hub, an axle-box closed at its outer end and engaging said hub, said hub and axle-box being apertured near their outer ends; a spindle engaging the axle-box and having an annular groove in registry with said apertures; and a tubular member extending through the apertures into the groove and having a closure at its outer end.

3. A hub, an axle-box in said hub, a spindle engaging the axle-box and having an annular groove, a washer member engaging said groove and having an aperture, and a tubular member extending through the hub and the axle-box into the aperture of the washer and provided with a closure at its outer end.

4. The combination with a spindle having an annular groove, of a hub having an axle-box, and a lubricating-tube extending beyond the inner surface of the axle-box and engaging the annular groove.

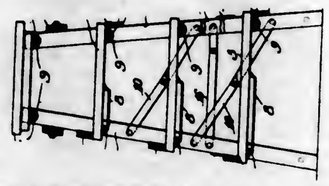
5. The combination with a spindle having an annular groove, of a hub having an axle-box, and a lubricating-tube extending beyond the inner surface of the axle-box and engaging the annular groove; said tube having near its inner end a plug provided with a feed-opening.

6. The combination with a spindle having an annular groove, of a hub having an axle-box, a lubricating member extending through the hub and axle-box, and a washer having a perforation affording a seat for the member engaging the annular groove and inner end of the lubricating member.

7. A hub having an axle-box, a spindle engaging said axle-box and having an annular groove, said spindle terminating short of the outer extremity of the axle-box, a closure for the latter whereby a chamber is formed adjacent to the outer end of the spindle, a tubular member extending through the hub and the axle-box into the annular groove of the spindle, and a closure at the other end of said tubular member.

811,616. FOLDING STEP-LADDER.

GEORGE W. BOSS, Woburn, Mass. Filed July 17, 1905. Serial No. 269,979.



Claim.—1. In a folding step-ladder, a pair of stiles, each comprising two members, tread-supports connecting said members, and a series of treads pivoted to the tread-supports of one stile and having a sliding engagement with those of the other stile.

2. In a folding step-ladder, a pair of stiles each comprising two members, tread-supports connecting said members, a series of treads of different lengths pivoted to the tread-supports of one stile and having a sliding engagement with those of the other stile, and a cap-piece of less length than the shortest tread pivoted to the upper end of each stile.

3. In a folding step-ladder, a pair of stiles each having a plurality of tread-supports, a series of treads, each tread pivoted at one end to a tread-support of one stile and resting at the other end on a tread-support of the other stile, and cleats on said latter stile to engage the upper side of the treads as the ladder is opened.

4. In a folding step-ladder, a pair of stiles, a plurality of treads of different length, each tread being pivoted to one stile and having a sliding pivotal connection with the other stile, and a cleat on the latter stile to engage the upper side of the extreme end of each tread as the ladder is opened.

5. In a folding step-ladder, a pair of stiles, each comprising two members connected by tread-supports, a series of treads pivoted to the tread-supports of one stile and having sliding engagement with those of the other stile, and cross-pieces connecting the members of the latter stile and arranged to be engaged by the upper side of the treads when the ladder is open for use.

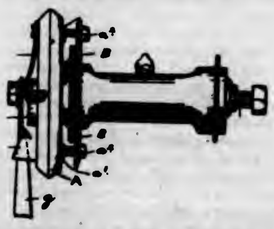
6. In a folding step-ladder, a pair of stiles, each comprising two members connected by tread-supporting rods, a series of treads, each tread pivoted at one end to a rod of one stile and resting at the other end on a rod of the other stile and a guide secured to each tread and embracing the corresponding rod of the latter stile.

7. In a folding step-ladder, a pair of stiles each comprising two members connected by tread-supports, a series of treads pivoted to the tread-supports of one stile and slidably connected to the tread-supports of the other stile, and jointed braces connecting the stiles.

8. In a folding step-ladder, a pair of stiles each comprising two members connected by tread-supports, a series of treads pivoted to the tread-supports of one stile and slidably connected to the tread-supports of the other stile, jointed braces connecting the stiles, and means to limit the spreading movement of the stiles caused by straightening the braces.

811,617. BRAKE FOR THE HUBS OF CYCLES.

WILLIAM CHAMBERLAIN and ARTHUR CHAMBERLAIN, Wigston Magna, England. Filed July 11, 1904. Serial No. 216,157.

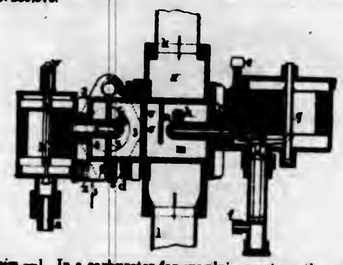


Claim.—A hub hand-brake for the wheels of cycles and other mannmotive or power-driven machines or vehicles comprising the following elements: a brake-shell A, lugs a', sectional fixing-plates B and nuts a^3, loosely fitting brake-segments C, the tapered peripheries

of which fit to the opposing portion of the brake-shell, a covering-plate E, the stud F', a cam-lever F carried by said stud, the said cam lying against one of the loose segments C, the outer end of the lever bored to carry a connecting-rod, a stop G, and a return-spring H, substantially as described.

811,618. CARBURETER FOR HYDROCARBON-ENGINES.

CHARLES H. CLAUDEL, Argenteuil, France. Filed May 26, 1904. Serial No. 209,976.



Claim.—1. In a carbureter for supplying motors, the combination of a vaporization or gasification chamber, a casing surrounding this chamber and providing for the exhaust-gases of the motor a passage having two parts which overlie different portions of said chamber, the outer walls of said parts being heat-conducting to an unequal extent, and means for varying the distribution or circulation of the exhaust-gases in the two parts of said passage.

2. In a carbureter for supplying motors, the combination of a vaporization or gasification chamber, a casing inclosing the same and providing for the exhaust-gases of the motor a passage having two parts which overlie different portions of said chamber, means for varying the distribution of the exhaust-gases in the two parts of said passage, and a heat-insulating layer covering the outer wall of one of said parts.

3. In a carbureter for supplying motors, the combination of a vaporization or gasification chamber, a casing inclosing the same and providing for the exhaust-gases of the motor a passage divided into two parts which overlie different portions of said chamber, the outer wall of one of these parts being thin and a good conductor of heat, and means for varying the distribution of the exhaust-gases in the two parts of said passage.

4. In a carbureter for supplying motors, the combination of a vaporization or gasification chamber, a casing inclosing the same and providing a passage for the exhaust-gases of the motor, a main outlet and a supplementary outlet for the exhaust-gases each leading from said passage, and means for regulating the flow of said gases through the supplementary outlet.

5. In a carbureter for supplying motors, the combination of a vaporization or gasification chamber, a casing inclosing the same and providing a passage for the exhaust-gases of the motor, said passage having two parts which overlie different portions of said chamber, means for varying the distribution or circulation of the exhaust-gases in the two parts of the passage, a supplementary outlet leading from one of the parts of said passage, and means for regulating the flow of said gases through the supplementary outlet.

6. In a carbureter for supplying motors, the combination of a vaporization or gasification chamber, a casing inclosing the same and providing for the exhaust-gases of the motor a passage having two parts which overlie different portions of said chamber, the outer walls of said parts being heat-conducting to an unequal extent, means for varying the distribution or circulation of the exhaust-gases in the two parts of said passage, a supplementary outlet leading from one of the parts of the passage, and means for regulating the flow of said gases through the supplementary outlet.

7. In a carbureter for supplying motors, the combination of a vaporization or gasification chamber, a casing inclosing the same and providing a passage for the exhaust-gases of the motor, said passage being divided into two parts which overlie different portions of said chamber, a heat-insulating layer covering a portion of the outer walls of one of said parts, means for varying the distribution or circulation of the exhaust-gases in the two parts of the passage, a supplementary outlet leading from one of the parts of said passage, and means for regulating the flow of said gases through the supplementary outlet.

8. In a carbureter for supplying motors a vaporization or gasification chamber with horizontal axis divided into two communicating compartments by a vertical baffle-plate, a combustible liquid-injector, opening into one of the compartments, and an air-suction conduit in communication on the one hand with the atmosphere on the other hand with the suction-pipe of the motor and separated from the second compartment of the chamber by means of a perforated partition, substantially as described and represented.

9. A carbureter for supplying motors comprising in combination a vaporization or gasification chamber with horizontal axis and divided into two communicating compartments by a vertical baffle-plate, a small air-inlet and an injector for combustible liquid opening into one of the compartments, and an air-suction conduit in communication on the one hand with the atmosphere, on the other hand with the suction-pipe of the motor and separated from the second compartment of the chamber by a perforated partition substantially as described and illustrated.

10. A carbureter for supplying motors comprising, in combination, a vaporization or gasification chamber with horizontal axis divided into two communicating compartments by means of a vertical baffle-plate, an injector for combustible liquid not capable of being vaporized at the ordinary temperature, opening into one of the compartments, means for heating the chamber, an air-suction conduit in communication on the one hand with the atmosphere, on the other hand with the suction-pipe of the motor and separated from the second compartment of the vaporization-chamber by means of a perforated partition, and an injector for volatile liquid opening into the said conduit, substantially as described and represented and for the purpose indicated.

11. A carbureter for supplying motors comprising, in combination, a vaporization or gasification chamber with horizontal axis divided into two communicating compartments by a vertical baffle-plate, an injector for combustible liquid not capable of being vaporized at the ordinary temperature opening into one of the compartments, means for heating the chamber, an air-suction conduit divided into two longitudinal compartments by a partition, each of the said compartments being in communication on the one hand with the atmosphere on the other hand with the suction-pipe of motor and one of them being separated from the second compartment of the chamber by a perforated partition, an injector for volatile liquid opening into the compartment of the conduit which is connected to the chamber, and means for regulating the admission of air into the other compartment of the conduit, substantially as described and illustrated and for the purpose indicated.

12. In a carbureter for supplying motors, the combination of a vaporization or gasification chamber divided by a baffle-plate into two communicating compartments, a casing enveloping said chamber and providing a passage for the exhaust-gases of the motor, means for varying the quantity of heat given up by these gases to said chamber, means for injecting liquid combustible into one of the compartments of said chamber, and an air-suction conduit adapted to lead from the atmosphere to the suction-pipe of the motor and separated from the second compartment of said chamber by means of a perforated partition.

13. In a carbureter for supplying motors, the combination of a vaporization or gasification chamber divided by a baffle-plate into two communicating compartments, a casing enveloping said chamber and providing a passage for the exhaust-gases of the motor, said passage being divided into two parts which overlie different portions of said chamber, means for varying the distribution or circulation of the exhaust-gases in the two parts of the passage, means for injecting liquid combustible into one of the compartments of said chamber, and an air-suction conduit adapted to lead from the atmosphere to the suction-pipe of the motor and separated from the second compartment of said chamber by a perforated partition.

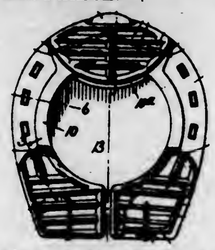
14. In a carbureter for supplying motors, the combination of a vaporization or gasification chamber divided by a baffle-plate into two communicating compartments, a casing enveloping said chamber and providing a passage for the exhaust-gases of the motor, a supplementary outlet leading from said passage and means for regulating the flow of said gases through the same, means for injecting liquid combustible into one of the compartments of said chamber, and an air-suction conduit adapted to lead from the atmosphere to the suction-pipe of the motor and separated from the second compartment of said chamber by means of a perforated partition.

811,619. HORSESHOE.

FRED N. CLINE, Chicago, Ill. Filed May 2, 1904. Serial No. 205,858.

Claim.—1. A horseshoe comprising, in combination with the body or plate having on the under side calk-pockets, calks therein comprising a rubber-embedded metal skeleton, such skeleton hav-

ing an outline-bar and cross-bars spanning it deflected from the plane of the outline-bar, and nails securing the calk in the pocket entering through the pockets' marginal wall and extending over the outline-bar and under a cross-bar.



2. In a horseshoe, in combination with a shoe-plate having on the under side calk-pockets; calks comprising a rubber-embedded metal skeleton lodged in the pockets, and headless nails entered through the marginal wall of the pockets engaging the metal skeleton and driven into the rubber in which the skeleton is embedded with a range for further penetration thereinto sufficient to clear the marginal wall.

3. In a horseshoe, in combination with the body or plate, a toe-guard, 9, having a tang, 9*, and a clenching-lug, 9*, the plate having at the forward side a notch to receive the tang, and a recess in the upper surface to seat the clenching-lug.

4. In a horseshoe, in combination with the metal body or plate, a toe-guard, 9, having a tang, 9*, and shoulders, 9*, limiting the thrust of the tang across the plate, and a clenching-lug, 9*, the plate notched at the forward side to receive the tang, and recessed at the upper surface to receive the clenching-lug.

5. In a horseshoe, in combination with the metal body or plate, a toe-guard, 9, having a tang, 9*, and a clenching-lug, 9*, the plate having at the forward side a notch extending across its entire thickness adapted to receive the tang from below and having a recess in the upper surface to seat the clenching-lug, the lug having a terminal turned inward at right angles and the recess having a pocket at the inner end to receive such inturned terminal when the lug is folded into the recess.

811,620. BOBBIN-HOLDING MEANS FOR LOOM-SHUTTLES. ROBERT L. CUSHOCK, Anderson, S. C. Filed Jan. 3, 1903. Serial No. 137,004.

Claim.—1. In combination, a shuttle having rigid bobbin-holding surfaces and a bobbin having yielding rings for engaging said rigid surfaces, substantially as described.

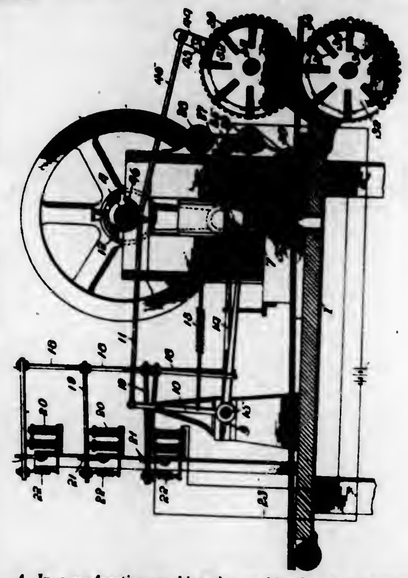
2. In combination, a shuttle having opposing corrugated rigid bobbin-holding surfaces, a bobbin having rings for engaging said corrugated surfaces, and an elastic sleeve between the rings and bobbin, substantially as described.

811,621. AUTOMATIC PAPER-PERFORATING MACHINE. HERBERT L. DAVIS, Washington, D. C. Filed May 9, 1903. Serial No. 156,303.

Claim.—1. In a perforating-machine, the combination of a relatively movable plunger and die-block, a plurality of punches slidably mounted in said plunger, punch-locking devices carried by said plunger and held normally in inoperative position, and electrically-operated means controlled by a pattern-sheet, normally disengaged from said locking devices, to move said devices into position to lock said punches to said plunger in predetermined sequence, substantially as set forth.

2. In a perforating-machine, the combination of a relatively movable die-block and plunger, a plurality of punches slidably mounted in said plunger, a punch-locking dog for each punch normally held in inoperative position, means normally disengaged from said locking-dogs to move the latter into position to lock said punches to the plunger, and means controlled from a pattern to actuate said engaging means, substantially as described.

3. In a perforating-machine, the combination of a relatively movable plunger and die, a plurality of punches slidably mounted in said plunger, a locking-dog for each punch normally held in inoperative position, a reciprocatory catch for each dog normally held out of engagement therewith, means to cause the catches and dogs to engage, and automatic means to control the sequence of said engagements.



4. In a perforating-machine the combination of a relatively movable plunger and die, a plurality of punches slidably mounted in said plunger, an independent locking-dog for each punch having a recess therein normally held in line axially with the punch, means to move each of said dogs into position to lock the corresponding punch to the plunger, said means comprising a reciprocatory member, a series of catches pivoted thereto one for each dog, the ends of said catches passing adjacent to the ends of said dogs but normally held out of engagement therewith, and means to cause said catches to engage the corresponding dogs in predetermined sequence.

5. In a perforating-machine, the combination of a relatively movable plunger and die, a plurality of punches slidably mounted in said plunger, an independent locking-dog for each punch normally held in inoperative position, a reciprocatory member carrying a series of pivoted catches, means to reciprocate said member back and forth once for every up-and-down stroke of the plunger, the ends of said catches being adapted to engage the ends of said locking-dogs but normally held out of engagement therewith, supporting-rods carrying said catches, levers attached to said rods and means to actuate said levers in predetermined sequence to cause said catches to engage said dogs and the latter to be moved into operative position to lock the punches to the plunger.

6. In a perforating-machine, the combination of a relatively movable plunger and die, a plurality of punches slidably mounted in said plunger, independent locking-dogs mounted to slide transversely in said plunger adjacent to the ends of said punches, said dogs having recesses normally maintained in alinement with said punches, and means to move said dogs to lock said punches to said plunger, said means comprising a member carrying a plurality of hooked catches, means to reciprocate said member in a direction substantially transverse to the movement of the plunger, the hooked ends of said catches passing adjacent to the ends of the locking-dogs, means to normally maintain said ends out of engagement with the locking-dogs, and means to place said ends in position to engage said dogs during the reciprocation of said member whereby said dogs will lock the punches to the plunger, said last-mentioned means being automatically controlled by pattern mechanism.

7. In a perforating-machine, the combination of a relatively movable plunger and die, a series of punches axially movable in said plunger, independent locking means for said punches, a vibratory member carrying devices adapted to engage and operate said locking means, means to reciprocate said member, means to normally hold said devices and locking means disengaged, a series of electro-

magnets, and connections from the armatures thereof to said devices, and pattern mechanism arranged to control the circuits of said electromagnets.

8. In a perforating-machine, the combination of a relatively movable plunger and die, a series of punches axially movable in said plunger, locking-dogs for said punches transversely mounted to slide in said plunger, springs to normally maintain said dogs in inoperative position, a sliding member carrying a series of draw-bars adapted to engage and operate said locking-dogs, means to reciprocate said member, a series of electromagnets having pivoted armatures connected to said draw-bars, springs to normally maintain said armatures and draw-bars in inoperative position, means to close and open the circuits of said electromagnets comprising a contact-cylinder and a series of contact-fingers and means to feed a stencil or pattern sheet between said cylinder and fingers.

9. In a perforating-machine, the combination with a reciprocatory plunger carrying a plurality of punches capable of movement relative thereto, and a lock for each punch to hold it against movement, of actuating devices to place the locks in locking position with relation to the punches said devices being normally out of engagement with said locks, and pattern-controlled means to bring the actuating devices into engagement with their respective locks.

10. In a perforating-machine, the combination with a reciprocatory plunger carrying a plurality of punches capable of movement relative thereto and a lock for each punch to hold it against movement, of actuating devices to place the locks in locking position with relation to the punches said devices being normally out of engagement with the locks, and reciprocable toward and away from the latter, means to reciprocate said devices, and pattern-controlled means to place said devices in engagement with the locks during movement toward the same.

11. In a perforating-machine, the combination with a reciprocating plunger carrying a plurality of punches having movement relative thereto, and locks to lock the punches against movement, of actuating devices for the locks normally out of engagement therewith and having movement toward and away from said locks, and electrically-operated means controlled by a pattern-sheet to throw said devices into engagement with the locks during movement of said devices in one direction and to retain the said devices engaged with the locks during the reverse movement of said devices whereby the locks are actuated to lock the punches to the plunger.

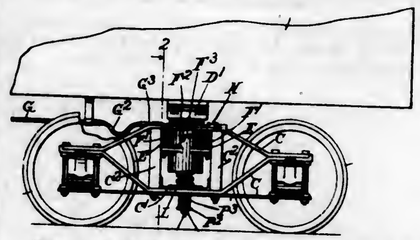
12. In a perforating-machine, the combination with a reciprocating plunger carrying a plurality of punches having movement relative thereto, and locks to lock the punches against movement, of actuating devices for said locks normally disengaged therefrom, electrically-operated means controlled by a pattern-sheet to throw said devices into engagement with the locks to actuate the latter to lock the punches, and means to return the locks to normal position when out of operative relation to the actuating devices.

13. In a perforating-machine, the combination with a reciprocating plunger carrying a plurality of punches having movement relative thereto, and locks to lock the punches against movement, of actuating devices for the locks normally out of engagement therewith and having movement toward and away from said locks, electrically-operated means controlled by a pattern-sheet to throw said devices into engagement with the locks during movement of said devices in one direction and to retain the parts engaged during the reverse movement of said devices whereby the locks are actuated to lock the punches to the plunger, and means to return the locks to normal position when out of operative relation to the actuating devices.

14. In a perforating-machine, the combination with a reciprocating plunger carrying a plurality of punches having movement relative thereto, and locks to lock the punches against movement, of actuating devices for the locks normally out of engagement therewith and having continuous movement toward and away from said locks, and means to throw said devices into engagement with the locks during movement of said devices in one direction and to retain said devices engaged with the locks during the reverse movement of said devices whereby the locks are actuated to lock the punches to the plunger.

15. In a perforating-machine, the combination with a reciprocating plunger carrying a plurality of punches having movement relative thereto, and locks to lock the punches against movement, of actuating devices for the locks normally out of engagement therewith and having movement toward and away from said locks, and pattern-controlled electrically-operated means controlled by a pattern-sheet to throw said devices into engagement with the locks during movement of said devices in one direction and to retain said devices engaged with the locks during the reverse movement of said devices whereby the locks are actuated to lock the punches to the plunger.

811,622. AIR-CUSHION FOR VEHICLES. MURILLO DOWNER, Chicago, Ill. Filed May 7, 1904. Serial No. 206,842.



Claim.—1. In an air-cushioning device for vehicles an air-cushion to normally carry the load and a spring within such cushion adapted to provide an elastic support for the vehicle when the pressure of air is diminished in the cushion.

2. An air-cushion for vehicles comprising a cylinder and a plunger in combination with a spring normally in engagement with but one of the parts of such cushion, and adapted to engage with the other so as to support the vehicle when the air-pressure in the cylinder is diminished.

3. In an air-cushion for vehicles the combination of a cylinder, a plunger therein, a spring upon the plunger normally out of engagement with the end of the cylinder and adapted to be brought into engagement therewith when the pressure of air in the cylinder is diminished

4. An air-cushioning device for vehicles adapted to be interposed between the body of the vehicle and its running-gear, comprising an air-cylinder associated with one of such parts of the vehicle, a plunger in such cylinder such plunger and cylinder adapted to coact to normally carry the load and a flexible connection between the plunger and the other of such parts.

5. In an air-cushion for vehicles the combination of an air-cylinder, a plunger in such cylinder, a spring on each side of such plunger, the one within the air-chamber normally not under tension, the one on the other side of the plunger being adapted to form a connection between the plunger and one of the parts of the vehicle to be cushioned.

6. In an air-cushion for vehicles the combination of a floating bolster, a cylinder on such bolster having a removable cap and adapted to form a support for the vehicle-body, a plunger in the cylinder and a connection between the plunger and the running-gear of the vehicle.

7. In an air-cushion for vehicles the combination of a floating bolster, a cylinder on such bolster having a removable cap and adapted to form a support for the vehicle-body, a plunger in the cylinder, and an elastic support between the plunger and the running-gear of the vehicle.

8. In an air-cushion for vehicles the combination of a floating bolster, a cylinder on such bolster, a bearing-plate on the cylinder adapted to provide a sliding bearing for the vehicle-body, a plunger in such cylinder, and a flexible support interposed between the plunger and the running-gear of the vehicle.

9. In an air-cushion for vehicles the combination of a floating bolster, a cylinder on such bolster, a bearing-plate on the cylinder adapted to provide a sliding bearing for the vehicle-body, a plunger in such cylinder, a flexible support interposed between the plunger and the running-gear of the vehicle, and a device adapted to limit the upward travel of the floating bolster.

10. In an air-cushioning device for vehicles the combination of a floating bolster, an air-cushion interposed between such bolster and the running-gear of the vehicle, and a device for limiting the upward travel of the bolster comprising a bolt and an elastic device thereon adapted to be put under tension when the bolster is raised.

11. In an air-cushioning device for vehicles the combination of a floating bolster with a cylinder at each end, sliding bearings for the vehicle-body on such cylinders, plungers in the cylinders, and flexible connections between the plungers and the running-gear of the vehicle.

12. In an air-cushioning device for vehicles the combination of a floating bolster with a cylinder at each end, sliding bearings for the vehicle-body on such cylinders, plungers in the cylinders, flexible

connections between the plungers and the running-gear of the vehicle, and a support for the vehicle-body centrally of the bolster.

type-channels, of a bar located opposite the discharge end of the

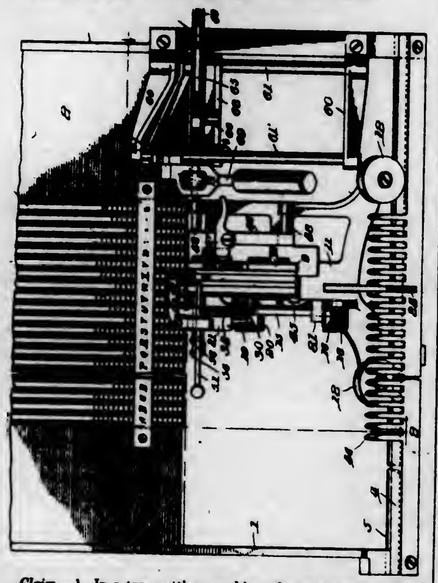
blade on the carriage, and a key-lever connected to the blade and

rings being adapted to carry the type-holder into operative position

connections between the plungers and the running-gear of the vehicle, and a support for the vehicle-body centrally of the bolster.

13. In a cushion device for vehicles, the combination of an air-cushion to normally carry the load, with an auxiliary spring adapted to provide an elastic support when the pressure of air is diminished in the cushion.

811,623. **TYPE-SETTING MACHINE.** JOSEPH S. DUNCAN, Chicago, Ill., assignor to Addressograph Company, Chicago, Ill., a Corporation of Illinois. Filed May 28, 1904. Serial No. 209,266.



Claim.—1. In a type-setting machine, the combination with a series of type-channels, of a carriage adapted to travel adjacent to said channels, a type-holder on the carriage, setting means carried by the carriage for moving type from the channels into the holder, a key-lever for operating said setting means and forming a handle for moving said carriage, and means for locking the key-lever and through the key-lever locking the carriage during the setting operation.

2. In a type-setting machine, the combination with a series of type-channels, of a carriage, a type-holder on the carriage, setting means on the carriage for moving type from the channels into the holder, means for locking the carriage, and a lever adapted to be operated first to move the carriage into operative relation to a type-channel and then to engage the locking means to lock the carriage and operate the setting means.

3. In a type-setting machine, the combination with a series of type-channels, of a carriage, a type-holder on the carriage, setting means for moving type from the channels into the holder, a bar provided with teeth, and a lever for operating the setting means adapted to be engaged with said toothed bar to lock the carriage during the setting operation.

4. In a type-setting machine, the combination with a series of type-channels, of a carriage, a type-holder on the carriage, setting means for moving type from the channels into the holder, a bar provided with teeth forming sockets therebetween corresponding in relation to the type-channels, and a lever for operating the setting means adapted to enter one of said sockets to lock the carriage during the setting operation.

5. In a type-setting machine, the combination with a series of type-channels, of a bar located opposite the discharge end of the channels and having sockets corresponding in relation to the type-channels, a movable carriage arranged to travel between the type-channels and said bar, a type-holder on said carriage, setting means on the carriage for moving type from the channels into the holder, and a lever arranged to enter one of said sockets to lock the carriage during the setting operation.

6. In a type-setting machine, the combination with a series of type-channels, of a bar located opposite the discharge end of the channels and provided with teeth forming sockets in parallelism with the type-channels, a movable carriage arranged to travel between the type-channels and said bar, a type-holder on the carriage, a setter device on the carriage for moving type from the channels into the holder, and a lever connected to said carriage and setter for moving the carriage and then operating the setter and adapted to enter one of said sockets to lock the carriage during the setting operation.

7. In a type-setting machine, the combination with a series of type-channels, of a carriage, a type-holder on the carriage provided with one or more type-grooves, and setting means arranged to first move into one of the type-channels and then move the first type in said channel into a type-groove.

8. In a type-setting machine, the combination with a series of type-channels, of a type-holder, a carriage, a setter-blade on the carriage and means for operating said blade to first enter a channel between the first and second type therein and then move the first type from the channel into the holder.

9. In a type-setting machine, the combination with a series of type-channels, of a type-holder, a setter device moving in a rectangular orbit for moving the type from a channel into the holder, and means for operating said setter.

10. In a type-setting machine, the combination with a series of type-channels, of a carriage, a type-holder on the carriage, a setter device, an arm on the carriage carrying said setter, and means for operating said arm to cause said setter to travel in a rectangular orbit and move the type from a channel into the holder.

11. In a type-setting machine, the combination with a series of type-channels, of a carriage, a holder on the carriage, a setter device, means for moving said setter in an angular orbit to enter and move a type from a channel into the holder, and guiding means for the setter.

12. In a type-setting machine, the combination with a series of type-channels, of a carriage, a type-holder on the carriage, a setter device, an arm on the carriage carrying said setter, means for operating said arm, and guiding means for the arm to cause the setter to travel in a rectangular orbit and move the type from the channel into the holder.

13. In a type-setting machine, the combination with a series of type-channels, of a carriage, a type-holder on the carriage, a setter, an arm on the carriage carrying said setter, a key-lever for operating said setter-arm, a guide-lug on the carriage, and a lug on the setter-arm guided on said guide-lug to guide the setter-arm and setter.

14. In a type-setting machine, the combination with a series of type-channels, of a carriage, a type-holder, a setter device for moving type from the channels into the holder, and means for operating said setter comprising an arm carrying the setter, a key-lever, and a toggle connection between the setter-arm and key-lever.

15. In a type-setting machine, the combination with a series of type-channels, of a carriage, a type-holder on the carriage, a setter device, an arm on the carriage carrying said setter device, a key-lever, and an arm on the key-lever for engaging the setter-arm to cause the setter to move type from the channels into the holder.

16. In a type-setting machine, the combination with a series of type-channels, of a carriage, a type-holder on the carriage, a setter device, an arm on the carriage carrying said setter, a key-lever, a toggle connection between the setter-arm and the key-lever to cause the setter to move into a type-channel, and an arm on the key-lever to move the setter-arm and cause the setter to move the type from the channels into the holder.

17. In a type-setting machine, the combination with a series of type-channels, of a carriage, a type-holder, a setter device for moving type from the channels into the holder, an arm carrying said setter, a key-lever, a socket pivoted on the setter-arm, an arm 28 pivoted on the carriage, a roller on said arm 28 working in said socket-arm, a link connecting the key-lever with the arm 28, and an arm 37 to engage the setter-arm.

18. In a type-setting machine, the combination with a series of type-channels, of a type-holder, a setter device for moving the type from the channels into the holder, means for holding the type in the channels, and means for moving said holding means from the channel in which the setter is operated.

19. In a type-setting machine, the combination with a series of type-channels, of a type-holder, a setter device for moving type from the channels into the holder, an arm carrying said setter, a spring-arm on the machine for closing the discharge end of each channel, and means on the setter-arm for moving said spring-arm away from the channel when the setter moves therein.

20. In a type-setting machine, the combination with a series of type-channels, of a carriage, a type-holder on the carriage, a setter-blade on the carriage, and a key-lever connected to the blade and adapted to be depressed to cause the setter-blade to first enter a type-channel and then move the type into the holder.

21. In a type-setting machine, the combination with a series of type-channels, of a carriage, a type-holder on the carriage provided with one or more type-grooves, a setter device carried by the carriage for moving type from the channels into the holder, and means for adjusting the type-holder relative to said setter device.

22. In a type-setting machine, the combination with a series of type-channels, of a carriage, a type-holder on the carriage, a setter-blade on the carriage, means for adjusting the holder relative to said blade, and means for operating said blade to move type from the channels into the holder.

23. In a type-setting machine, the combination with a series of type-channels, of a carriage, a type-holder, a movable frame on the carriage carrying said type-holder, a setter device for moving type from the channels into the holder, and means for adjusting said frame on the carriage relative to said setter.

24. In a type-setting machine, the combination with a series of type-channels, of a carriage, a movable frame on the carriage, a type-holder carried by said frame, a setter device for moving type from the channels into said holder, and feed-dogs for adjusting said frame and holder on the carriage relative to the setter.

25. In a type-setting machine, the combination with a series of type-channels, of a carriage, a movable frame on the carriage, a type-holder carried by said frame, a setter device for moving type from the channels into said holder, a spring-actuated dog 53, and a lever 51 carrying a feed-dog and adapted to be operated to operate the feed-dog 53 to adjust the holder relative to the setter.

26. In a type-setting machine, the combination of a holder provided with a type-groove open at the top, and slug-setting means comprising a driver operating at a right angle to the groove to set a slug into the groove through its top.

27. In a type-setting machine, the combination of a holder provided with a type-groove open at the top, and slug-setting means comprising a driver arranged to operate above the top of a slug to set the slug into said groove through the top thereof.

28. In a type-setting machine, the combination of a holder provided with a type-groove open at the top, and slug-setting means movable lengthwise of the groove for setting slugs therein at any point along the groove.

29. In a type-setting machine, the combination of a holder provided with a type-groove open at the top, and slug-setting means arranged to operate above the holder and movable lengthwise of the groove for setting slugs into the groove through its top and at any point along the groove.

30. In a type-setting machine, the combination of a holder provided with a type-groove open at the top, a slug having its base wider than the open top of the groove, and means for setting said slug in the groove.

31. In a type-setting machine, the combination of a holder provided with a type-groove open at the top, a slug having its base wider than the open top of the groove, and means for setting said slug in the groove through the top thereof and at any point along the groove.

32. In a type-setting machine, the combination with means for setting type in a holder, of means for setting slugs capable of being compressed, said means comprising a contracted discharge, and a driver for moving the slugs through the discharge into the holder.

33. In a type-setting machine, the combination with means for setting type in a holder, of means for setting compressible slugs in the holder comprising a slug-channel, having a contracted discharge, means for moving said discharge into engagement with the holder, and a driver for moving the first slug in the channel through the discharge into the holder.

34. In a type-setting machine, the combination with means for setting type in a holder, of means for setting slugs in the holder comprising a discharge arranged to engage the holder and enter the type-groove therein, a driver, and means for operating said driver to force a slug through the discharge into the type-groove.

35. In a type-setting machine, the combination with means for setting type in a holder, of slug-setting means comprising a slug-supply, a discharge, means for adjusting the discharge relative to the holder, and means for moving a slug from the supply into the holder.

36. In a type-setting machine, the combination with means for setting type in a holder, of slug-setting means comprising a slug-supply, a discharge, a flexible frame carrying the discharge, means for moving said discharge into engagement with the holder and a driver for moving a slug through the discharge into the holder.

37. In a type-setting machine, the combination with a movable carriage, of a type-holder carried thereby, and a slug-setter, said carriage being adapted to carry the type-holder into operative position with relation to the slug-setter and said slug-setter being movable at right angles to the direction of movement of the carriage.

38. In a type-setting machine, the combination with a type-holder, of a slug-setter comprising a discharge, a driver, a lever connected to said discharge and driver and adapted to move the discharge into engagement with the holder and then operate the driver to move a slug into the holder.

39. In a type-setting machine, the combination with a type-channel, of a type-holder having a type-groove, setting means for moving the first type from the channel into the groove, and means operated by the setting means to bear against the face of the second type to hold the remaining type in place in the channel while the first type is being moved from the channel into the type-groove.

40. In a type-setting machine, the combination with a type-channel, of a type-holder having a type-groove, setting means for moving type from the channel into the groove, a spring-arm, and an arm operated by the setting means for pressing the spring-arm against the face of the second type to hold the remaining type in the channel while the first type is being moved from the channel into the groove.

811,624. **DRAFT-FORCING MECHANISM.** JULES J. DURAGE, Duluth, Minn. Filed Mar. 31, 1904. Serial No. 201,010.

Claim.—1. In draft-forcing mechanism the combination with a locomotive-engine, of a casing positioned in the boiler extension-front thereof; a fan-driving engine mounted in said casing, a housing mounted on the forward end of said casing, a rotary fan mounted in said housing and geared to said engine, air inlet and exhaust ports in said housing, said exhaust-ports communicating exterior to the jacket of the boiler with the ash-pan and fire-box of said locomotive, means for automatically and arbitrarily governing the speed of said fan-driving engine, substantially as described.

2. In draft-forcing mechanism, the combination with a boiler, fire-box and ash-pan, of a fan-housing provided with feed and exhaust ports, a rotary fan mounted in said fan-housing, an engine provided with suitable feed and exhaust ports and connected to said fan for revolving the same, a steam-conducting conduit extending from said boiler into said engine, a valve interposed in said steam-conducting conduit and adapted to govern the admission of steam to said engine and comprising a steam-conduit provided with two valve-gates adapted either simultaneously or singly to govern the passage of steam through said conduit, one of said gates being adapted in closed position to entirely close said conduit and the other of said gates in closed position being adapted only to reduce the capacity of said conduit, means for operating the first said gate arbitrarily, means for operating the second said gate automatically, and air-conducting conduits connecting the exhaust-ports of said fan-housing with said ash-pan, substantially as described.

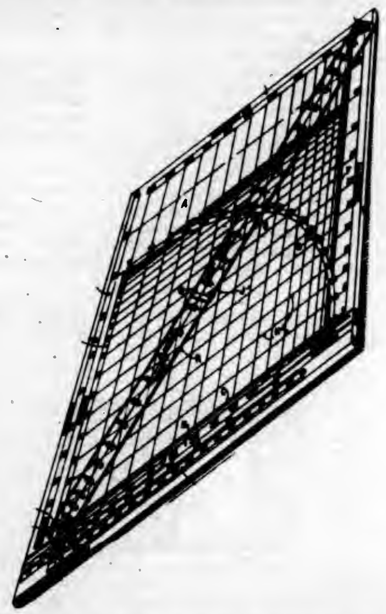
3. In a draft-forcing mechanism, the combination with a locomotive of an engine-housing positioned in the extension-front of the locomotive, an engine positioned in said housing, a steam-conducting conduit extending from the boiler into said engine, a valve interposed in said conduit and provided with two gates adapted either simultaneously or singly to reduce the capacity of said conduit and one of said gates being further adapted to entirely close said conduit, governing means connecting the other one of said gates with the reverse-lever of said locomotive and adapted to be operated by said reverse-lever when said lever is at any position off the center, governing means extending from the first said valve to the cab of said engine and adapted to be arbitrarily operated independently of said reverse-lever, a pressure-reducing valve interposed in said conduit between the boiler and said valve, a fan-housing secured to said engine-housing and provided with an inlet and exhaust ports, a rotary fan mounted in said fan-housing and connected to said engine, and air-conducting conduits communicating with the exhaust-ports of said fan-housing and with the ash-pan chamber of said locomotive, substantially as described.

811,625. **INSTRUMENT FOR GRAPHICALLY SOLVING SPHERICAL TRIANGLES ON A PLANE SURFACE.** HERBERT H.

811,626. **STEAM-BOILER FURNACE.** BYRON B. ELDRED, Bronx-

products of combustion to elongate and inflate the flame, a boiler, | track to be engaged by a passing train, and intermediate connections

811,625. **INSTRUMENT FOR GRAPHICALLY SOLVING SPHERICAL TRIANGLES ON A PLANE SURFACE.** HERBERT H. BENSOME, Longueville, near Sydney, New South Wales, Australia. Filed June 15, 1905. Serial No. 265,579.

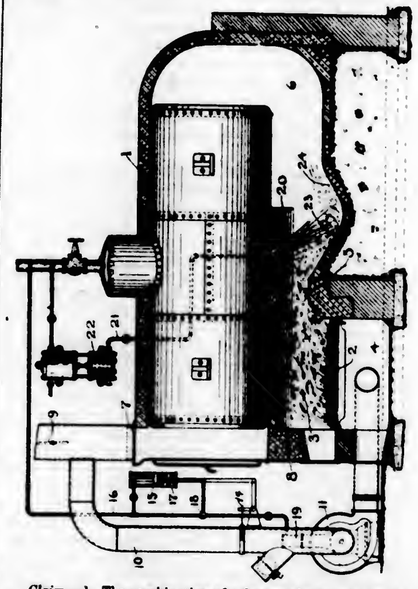


Claim.—1. An improved instrument for graphically solving spherical triangles on a plane surface consisting essentially of a rectangular plane surface on which are inscribed a graduated quadrant and various trigonometric and other scales in relation to said quadrant a slide on the slide-rule principle having thereon a scale of cosines and a scale of tangents in relation to said graduated quadrant and covering up the numbering of a scale of sines also in relation to said graduated quadrant a center-pin on said plane surface at the center of the graduated quadrant and a removable transparent radius bar or bars having centers adapted to take on the center-pin of the plane surface and having thereon scales of sines and cosines in relation to said center and the graduated quadrant of the plane surface substantially as herein described and explained.

2. An improved instrument for graphically solving spherical triangles on a plane surface consisting essentially of a rectangular plane surface on which are inscribed a graduated quadrant and various trigonometric and other scales in relation to said quadrant a slide on the slide-rule principle having thereon a scale of cosines and a scale of tangents in relation to said graduated quadrant and covering up the numbering of a scale of sines also in relation to said graduated quadrant a center-pin on said plane surface at the center of the graduated quadrant and a removable transparent radius-bar having two centers each adapted to take on the center-pin of the graduated quadrant of the plane surface and having scales of sines and cosines in relation to one such center (red) and having a scale of versines in relation to other said center (blue) which latter center is distant from the former the radius length of the graduated quadrant of the plane surface substantially as herein described and explained.

3. An improved instrument for graphically solving spherical triangles on a plane surface consisting essentially of a rectangular plane surface on which are inscribed a graduated quadrant and various trigonometrical and other scales in relation to said quadrant a slide on the slide-rule principle having thereon a scale of cosines and a scale of tangents in relation to said graduated quadrant and covering up the numbering of a scale of sines also in relation to said graduated quadrant a center-pin on said plane surface at the center of the graduated quadrant and removable transparent radius bar or bars having scales as set forth inscribed thereon substantially as herein described and explained.

811,626. **STEAM-BOILER FURNACE.** BYRON E. ELDRED, Brooklyn, N. Y., assignor to Combustion Utilities Company, New York, N. Y., a Corporation of New York. Filed Nov. 18, 1904. Serial No. 233,341.



Claim.—1. The combination of a furnace for burning fuel having a seat of combustion, means to pass through said seat a fixed gaseous diluent which will elongate and inflate the flame and retard its combustion, a steam-boiler within radiative reach of the flame, and means for carrying the elongated flame out of substantial contact with the boiler-surfaces during its incipiency.

2. The combination of a furnace having a refractory roofed combustion-chamber, means to produce a long slow-burning flame therein inflated with waste stack-gases passed through the seat of combustion, and a steam-boiler within radiative reach of the flame.

3. The combination of a furnace having a seat of combustion, a draft-chamber anterior thereto and supplying draft through the seat of combustion, and a waste-gas outlet, a return-conduit connecting said outlet with said draft-chamber and having a mechanical draft-accelerator, means to supply air to said draft-chamber, a steam-boiler located over said seat of combustion and heated by the furnace flame and gases, and a refractory wall roofing the furnace between said seat and the boiler for separating the flame from the boiler.

4. The combination of a furnace having a seat of combustion, means to pass products of combustion through the fuel-seat to elongate the flame, a steam-boiler within reach of the elongated flame, one or more jet-outlets in the roof of the combustion-chamber so directed as to blow the flame away from the boiler-surfaces at a point remote from the fuel-seat, and means to force a gaseous pressure fluid through said jet-outlets.

5. The combination of a furnace having a grate, a combustion-chamber and an ash-pit, means to supply an artificially-accelerated draft-current of air and stack-gases to said ash-pit, a refractory wall roofing said combustion-chamber, a steam-boiler, one or more jet-outlets located in the upper part of the combustion-chamber between the grate and the heating-surfaces of the boiler and so directed as to carry the flame away from the boiler, and means to supply air to said jet-outlets.

6. The combination of a furnace having a seat of combustion, means to supply to said seat a forced-draft current of air and diluent products of combustion to elongate and inflate the flame, a boiler, and a flame-channel included in the furnace and having a refractory surface in heat-radiating relation to the boiler and provisions whereby the flame is carried away from the boiler into contact with said surface.

7. The combination of a furnace having a seat of combustion, means to supply to said seat a forced-draft current of air and diluent products of combustion to elongate and inflate the flame, a boiler, and a flame-channel included in the furnace and having a refractory surface in heat-radiating relation to the boiler and one or more air-jet outlets on the boiler side of said channel directed toward said surface.

8. The combination of a steam-boiler, a furnace having a seat of combustion and a flame-channel roofed with refractory material between said fuel-seat and the heating-surfaces of the boiler, means to supply products of combustion and air through said fuel-seat to produce an elongated slow-burning flame, and means to locally agitate the flame substantially at the beginning of said heating-surfaces.

9. In a steam-boiler furnace the combination of a boiler, a fire-box therefor, means to supply air and a neutral diluent to the fire in such manner as to elongate the flame, means to substantially complete the combustion of the elongated flame at a definite or predetermined point remote from the fire-box and in radiative relation to the boiler, and means to maintain the flame in a surrounding reverberative influence anterior to said point and out of substantial contact with the boiler.

10. In a steam-boiler furnace the combination of a boiler, a fire-box therefor having a seat of combustion, means to supply air and products of combustion through said seat, a refractory roofed chamber between the fire-box and the flues of the boiler, and means to supply an intercepting jet of air to the flame issuing from said chamber.

11. The combination of a boiler, a furnace having a seat of combustion, means to supply air and products of combustion through said fuel-seat, a refractory roofed flame-channel between said seat and the heating-surfaces of the boiler, and refractory surfaces heated by the flame and located beyond said channel in heat-radiating relation to the boiler.

12. In a steam-boiler furnace, a boiler, a seat of combustion, means to produce a long voluminous, slow-burning flame by inflation with waste stack-gases passed through the burning fuel and means to keep the long flame from contact with the relatively cold boiler-surfaces while combustion is incomplete, combined with refractory reverberative surfaces in radiating relation with the vaporizing-chamber of the boiler, heated by the flame and serving to maintain its ignition.

13. The combination of a horizontal return tubular boiler having a gas outlet or flue at its forward end, a fire-box under the forward part of the boiler having a seat of combustion, flame and gas passages extending rearwardly from the fire-box and forwardly through the boiler to the gas-outlet, a refractory wall roofing the fire-box between it and the forward part of the boiler, and means to pass products of combustion and air in predetermined proportion through said seat to elongate the flame.

14. The combination in a boiler-furnace of a support for burning solid fuel, means for supplying and passing through said support a neutral gaseous diluent in such manner as to inflate the flame and cool the fuel-bed, a boiler within heat-radiating reach of the flame, and means to keep the flame from contact with the boiler during its incipiency.

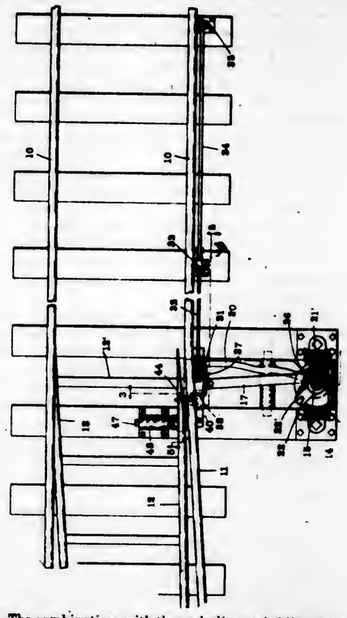
15. In a steam-boiler furnace the combination of a boiler, a fire-box therefor having a seat of combustion, means to pass through said seat a draft-current of air and neutral stack-gases, and means controlled by the steam-pressure for automatically varying the composition of the draft-current.

16. In a steam-boiler furnace the combination with the furnace of means for supplying air and for supplying stack-gases in the draft furnished to the fire, and means controlled by the steam-pressure for concurrently varying the volume and composition of the draft-current.

17. In a steam-boiler furnace, the combination of a boiler, a refractory walled fire-chamber, an inverted reverberatory arch beneath the boiler, means for producing an inflated slow-burning flame in the fire-chamber, air-introducing means for beating said flame down into the arch and completing its combustion, and means for carrying the resultant flame products into heat-radiating relation with the boiler.

811,627. **AUTOMATIC RAILROAD-SWITCH.** ROBERT K. FLOUTER, Lima, Ohio. Filed Apr. 10, 1905. Serial No. 254,651.

Claim.—1. The combination, with the main-line and siding rails; of switch-points adapted to connect one with the other; switch-throwing means consisting of a cranked shaft, connections between the crank thereof and the switch-points, and a separable polygonal connection between the shaft and operating member; a spring for returning the switch-points to normal, a lever arranged adjacent the track to be engaged by a passing train, and intermediate connections between said lever and the shaft for producing axial separation of the polygonal connection between the said shaft and the operating member.



2. The combination, with the main-line and siding rails and the movable switch-points for connecting one with the other, of a switch-stand, a vertical cranked shaft journaled in said switch-stand and axially movable therein, an operating member mounted on the switch-stand, a polygonal axially-separable connection between said operating member and the shaft, a connection between the crank of said shaft and the switch-points, a lever adapted to engage said shaft and shift the same axially, a lever arranged adjacent the track for engagement by a train, and intermediate connections between said lever and the shaft-shifting lever, whereby operation of said last-mentioned lever will shift the switch-stand shaft axially to separate the connection between said shaft and the switch-stand-operating member.

3. The combination, with the main-line and siding rails and the movable switch-points connecting one with the other, of a switch-stand, a vertical cranked shaft journaled in said switch-stand and axially movable therein, an operating member movable on the switch-stand, a polygonal axially-separable connection between said operating member and the shaft, a connection between the crank of said shaft and the switch-points, a lever adapted to engage said shaft and shift the same axially, a lever arranged adjacent the track for engagement by a train, intermediate connections between said lever and the shaft-shifting lever whereby operation of said last-mentioned lever will shift the switch-stand shaft axially to separate the connection between said shaft and the operating member, a catch for normally retaining the spring from action upon the switch-points, and intermediate connections between said catch and the track-lever for automatically withdrawing the catch.

4. The combination, with the main-line and siding rails; of switch-points adapted to connect one with the other; switch-throwing means consisting of a cranked shaft, connections between the crank thereof and the switch-points, and a separable polygonal connection between the shaft and operating member; a spring for returning the switch-points to normal, means for normally preventing the action of said spring upon the automatic operation of the switch-points, a lever arranged adjacent the track to be engaged by a passing train, and intermediate connections between said lever and the shaft for producing axial separation of the polygonal connection between the said shaft and the operating member.

5. The combination, with the main-line and siding rails and the movable switch-points connecting one with the other, of a switch-stand, a vertical cranked shaft journaled in said switch-stand and

axially movable therein, an operating member movable on the switch-stand, a polygonal axially-separable connection between said operating member and the shaft, a connection between the crank of said shaft and the switch-points, a lever adapted to engage said shaft and shift the same axially, a lever arranged adjacent the track for engagement by a train, intermediate connections between said lever and the shaft-shifting lever whereby operation of said last-mentioned lever will shift the switch-stand shaft axially to separate the connection between said shaft and the operating member, a catch for normally retaining the spring from action upon the switch-points, and intermediate separable connections between said catch and the track-lever for automatically withdrawing the catch only when the switch-points are left open.

6. In an automatic switch-throwing apparatus, the combination, with the main-line and siding rails and the movable switch-points connecting one with the other, of an independent spring adapted to urge the switch-points to main-line-closing position, means for normally preventing the action of said spring on said switch-points, and means operated by the passage of a train to withdraw said preventing means only when the switch-points are out of main-line-closing position.

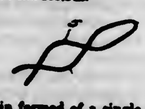
7. In an automatic switch-throwing apparatus, the combination, with the main-line and siding rails and the movable switch-points connecting one with the other, of a switch-stand, means operated by said switch-stand for manually throwing said switch-points from one position to the other, an independent spring for automatically throwing said switch-points to main-line-closing position, a catch arranged to normally prevent said action of said spring, an operating member arranged to withdraw said catch, and means automatically operated by the switch-stand for preventing the action of said operating member on the catch when the switch-points are in main-line position.

8. The combination, with the main-line and siding rails, of switch-points adapted to connect one with the other; switch-throwing means consisting of a cranked shaft, connections between the crank thereof and the switch-points, and a separable polygonal connection between the shaft and operating member; a spring for returning the switch-points to normal, a catch arranged to normally prevent said action of said spring, an operating member arranged to withdraw said catch, and intermediate connections between the switch-stand and said operating member for automatically preventing the action of said operating member on the catch when the switch-points are in main-line position.

9. In an automatic switch-throwing apparatus, the combination, with the main-line and siding rails and the movable switch-points connecting one with the other, of a switch-stand, means operated by said switch-stand for manually throwing said switch-points from one position to the other, a spring for automatically throwing said switch-points to main-line-closing position, a catch arranged to normally prevent said action of said spring, a rock-shaft, intermediate connections between said rock-shaft and said catch, train-operated means for operating said rock-shaft, and switch-stand-operated means for operating said rock-shaft into and out of catch-operating position when the switch-points are thrown out of and into main-line-closing position, respectively.

10. The combination, with the main-line and siding rails, of switch-points adapted to connect one with the other, switch-throwing means consisting of a cranked shaft, connections between the crank thereof and the switch-points, and a separable polygonal connection between the shaft and operating member, a spring for returning the switch-points to normal, a lever arranged adjacent the track to be engaged by a passing train, intermediate connections between said lever and the shaft for producing axial separation of the polygonal connection between the said shaft and the operating member, a catch arranged to normally prevent said action of said spring, a rock-shaft, intermediate connections between said rock-shaft and said catch, and switch-stand-operated means for shifting said rock-shaft into and out of catch-operating position when the switch-points are thrown out of and into main-line-closing position, respectively.

811,628. HAIR-PIN. Charles B. Pomeroy, Warren, Ohio. Filed Aug. 3, 1904. Serial No. 219,262.



Claim.—A hair-pin formed of a single piece of material comprising arms and a connecting bight portion, the arms each being bent to form a helix of slightly more than one convolution, the axes of the helices diverging slightly as they recede from the said bight portion, and the free ends of the arms being extended in opposite directions.

811,629. COMBINED CURTAIN-POLE AND SHADE-ROLLER SUPPORT. Ernest B. Fenner, Helena, Mont. Filed Mar. 6, 1905. Serial No. 248,627.

Claim.—1. The herein-described device comprising a plate having means for attachment to a window and with one end bent laterally for bearing beneath the window-casing and with a curtain-shade-roller bracket extending laterally from the other end and with a vertical socket between the bracket and plate, and a standard supported in said socket and having means at its free end for supporting a curtain-pole.

2. The herein-described device comprising a plate having means for attachment to a window and with one end bent laterally for bearing beneath the window-casing and with a curtain-roller bracket extending laterally from the other end and a vertical socket between the plate and bracket, and a standard supported in said socket and having means at its free end for supporting a curtain-pole.

3. The herein-described device comprising a plate having means for attachment to a window and with one end bent laterally for bearing beneath the window-casing and with a curtain-roller bracket extending laterally from the other end and a vertical socket between the plate and bracket and with one side open, a standard supported in said socket and provided with means at the free end for supporting a curtain-pole, and a tongue extending from said plate transversely of said socket and bearing upon the standard supported therein.

811,630. BEARING. Charles Glover, New Britain, Conn., assignor to Corbin Screw Corporation, New Britain, Conn., a Corporation of Connecticut. Filed Oct. 10, 1905. Serial No. 282,145.

Claim.—1. A bearing having an outer grooved ring, an inner grooved ring, balls therein, and trough-shaped pieces of sheet metal for separating the balls.

2. A bearing having an outer grooved ring, an inner grooved ring, balls therein, and trough-shaped pieces of sheet metal for separating the balls, having recesses 5 and 6.

3. A bearing comprising an outer grooved ring, an inner grooved ring, a series of balls located between said rings, and a series of sheet-metal separators or spacers located between said balls, the sides of the separators being yielding to permit insertion and removal.

811,631. PIPE-COUPLING. Andrew W. Graham, Bradford, Pa., assignor of one-half to Lewis B. Mallery, Bradford, Pa. Filed Mar. 27, 1905. Serial No. 252,393.

Claim.—1. The combination in a pipe-coupling, of a sleeve having a centrally-enlarged portion and provided with end flanges the inner faces of which form tapering packing-seats, an independent packing-ring for each seat, a follower for each ring, and bolts for compressing the packing between the packing-seat and follower.

2. In a pipe-coupling, a sleeve having end flanges provided with tapered recesses in its outer ends, packing-rings bearing against the inner faces of the flanges, pipe gripping or clamping members arranged in said tapered recesses, and a clamping means engaging both the packing-rings and clamping members.

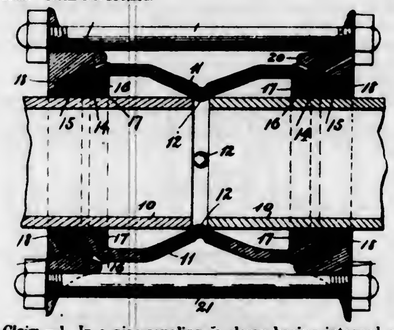
3. In a pipe-coupling, a sleeve having tapered end recesses, pipe-clamping members therein, a packing-ring, a follower therefor, and clamping-bolts extending through the flange and serving to draw the clamping members and follower toward each other.

4. In a pipe-coupling, a sleeve having an end flange provided with a tapered recess, a split ring seated therein and having peripheral notches, a packing-ring seated against the inner wall of the flange, a follower for said packing-ring and bolts connecting the follower and split ring.

5. A coupling having a plurality of staggered centering-tongues for independently engaging the ends of different pipe-sections

---

811,632. PIPE-COUPLING. Andrew W. Graham, Bradford, Pa., assignor of one-half to Lewis B. Mallery, Bradford, Pa. Filed Apr. 18, 1905. Serial No. 256,261.



Claim.—1. In a pipe-coupling, a sleeve having inturned end portions, packing-rings in which the ends of the sleeves are embedded and compression means acting against the outer faces of the rings.

2. The combination in a pipe-coupling, of a coupling-sleeve having inturned end portions, and packing members extending between the inner face of the sleeve and the exterior of the pipe-sections, the packing also extending over the ends of the sleeve, and a compression means acting against the outer portion of the packing.

3. In a pipe-coupling, a sleeve having opposite end portions of reduced diameter, and packing members leading over such end portions, said packing members being adapted to be forced into place by the introduction of a pipe-section within the sleeve.

4. In a pipe-coupling, a coupling-sleeve having reduced end portions, a packing-ring having a central annular groove for the reception of the end portion of the sleeve, the inner portions of the ring being forced within the sleeve by the introduction of the pipe thereinto, and a compression means acting against the outer face of the packing-ring.

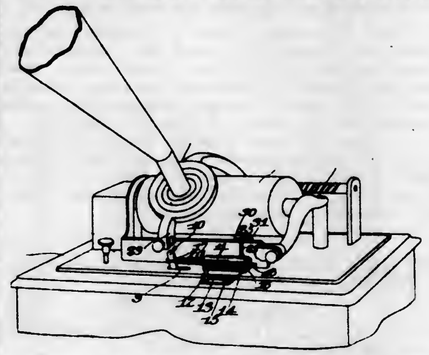
5. In a pipe-coupling, of a sleeve having reduced end portions, a packing-ring provided with an annular groove in which the end portion of the sleeve is seated, the inner face of the packing-ring being subjected to the pressure of the fluid in the pipe, and a packing clamping-ring engaging the outer face of the packing-ring.

6. In a pipe-coupling, a coupling-sleeve having its central portion provided with projections to be introduced between the adjacent ends of the pipe-sections to be coupled, the opposite ends of the sleeve being reduced in diameter, packing-rings grooved for the reception of the ends of the sleeve, and compression members acting against the outer faces of the rings.

7. In a pipe-coupling, a sleeve having inturned end portions, and packing-rings grooved for the reception of said end portions and disposed both inside and outside of said inturned ends.

8. In a pipe-coupling, the combination with pipe-sections, of a sleeve having enlarged portions to permit flexing of the pipe-line, and duplex packing-rings fitting against the pipe-sections and engaging both the inner and outer faces of the ends of the sleeve, whereby movement of the pipe-section at an angle with respect to the sleeve will compress the inner portion of the packing-ring at one side and the outer portion of the same packing-ring at the opposite side of the sleeve.

811,633. ATTACHMENT FOR PHONOGRAPHS. Lemas T. Groves, South New Berlin, N. Y. Filed Jan. 24, 1906. Serial No. 297,543.



Claim.—1. In a phonograph, the combination with a motor-brake, of a feed-shaft, a sound-box carriage mounted for travel on said shaft, a trip-lever actuated by the sound-box carriage for controlling the brake, and an adjustable impact-pin carried by the trip-lever.

2. In a phonograph, the combination with a motor-brake, of a feed-shaft, a sound-box carriage mounted for travel on said shaft, a weighted trip-lever actuated by the sound-box carriage for controlling the brake, and a threaded impact-pin adjustably mounted on one end of the trip-lever.

3. In a phonograph, the combination with a motor-brake, of a feed-shaft, a sound-box carriage mounted for travel on said shaft, a spring-actuated rod connected to the brake and provided with a locking-notch, and a trip-lever adapted to engage the notch in the rod to hold the same in set position, said lever being actuated by the sound-box to release the rod and operate the brake.

4. In a phonograph, the combination with a motor-brake, of a feed-shaft, a sound-box carriage mounted for travel on said shaft, a spring-actuated rod connected to the brake and provided with a locking-notch, and a pivoted bell-crank trip-lever the short arm of which is weighted and adapted to engage said notch for holding the rod in set position, said lever being actuated by the sound-box carriage to release the rod and operate the brake.

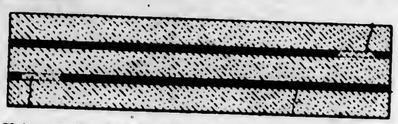
5. In a phonograph, the combination with a motor-brake, of a feed-shaft, a sound-box carriage mounted for travel on said shaft, a spring-actuated rod connected to the brake and provided with a locking-notch, a pivoted bell-crank trip-lever the short arm of which is weighted and adapted to engage said notch for holding the rod in set position, and an adjustable impact-pin carried by the long arm of the lever for engagement with the said box-carriage.

6. In a phonograph, the combination with a motor-brake, of a feed-shaft, a sound-box carriage mounted for travel on said shaft, a casing provided with alined openings, a spring-actuated rod slidably mounted in the openings of the casing and provided at one end thereof with a locking-notch, a bell-crank trip-lever pivoted within the casing and having its short arm weighted and adapted to engage the locking-notch for holding said rod in set position, the long arm of said lever passing through an opening in the top of the casing for engagement with the said box-carriage.

7. In a phonograph, the combination with a motor-brake, of a feed-shaft, a sound-box mounted for travel on said shaft, a casing provided with alined openings, a rod slidably mounted in said openings and provided with a locking-notch, a detachable link engaging the rod and connected to the brake, a plate carried by the rod, a spring interposed between the plate and the casing, a bell-crank trip-lever pivoted within the casing the short arm of which engages the.

notch in the rod for holding the latter in set position, and an adjustable impact-pin carried by the long arm of the lever for engagement with the sound-box carriage.

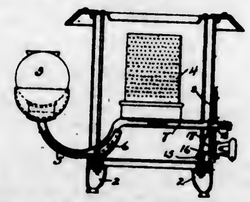
811,634. BUILDING BLOCK OR WALL. MARTIN HAAS, Kalamazoo township, Kalamazoo county, Mich. Filed Mar. 7, 1904. Serial No. 196,966.



Claim.—1. In a building block or wall, the combination of an artificial stone or concrete body portion; and vertically-arranged sheets of corrugated paper having facings thereon, to form a cellular structure thereof, and having perforations therethrough, embedded in said body, the said perforations being arranged in an alternating manner in relation to each other, for the purpose specified.

2. In a building block or wall, the combination of an artificial stone or concrete body portion; and vertically-arranged sheets of paper having perforations therethrough embedded in said body, the said perforations being arranged in an alternating manner in relation to each other, for the purpose specified.

811,635. OIL-STOVE. WILLIAM P. HARRISON, Cincinnati, Ohio. Filed July 6, 1905. Serial No. 268,427.



Claim.—In an oil-stove, an oil-reservoir and a burner rigidly connected together, a slotted front wall, with extension from the burner extending through said slot, a hand-wheel and crank with link connecting the crank to the burner extension inside the front wall and spring-bearing between the outer end of said extension and the front wall on the outside to hold the burner in any desired position, substantially as described.

811,636. TARGET. JOHN HIRSOLD, Detroit, Mich. Filed Apr. 10, 1905. Serial No. 254,879.

Claim.—1. In a target mechanism, a pivoted target, in combination with positive locking means operatively associated with the target for retaining the latter in the position in which it is placed by the projectile.

2. In a target mechanism, the combination with a support, of a target pivoted thereon for rocking movement, and locking means operatively associated with the target for retaining the latter in the position in which it is placed when struck by the projectile.

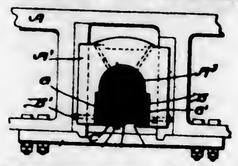
3. In a moving target, the combination with an endless carrier arranged for vertical travel, of a plurality of targets pivoted thereon for rocking movement in parallelism with and in angular relation to the carrier, and an automatic lock for each target for retaining the latter in parallelism with the carrier.

4. In a moving target, the combination with a vertically-traveling carrier, of a plurality of pivoted targets thereon, and a clutch connection between each target and the carrier.

5. In a moving target, the combination with a carrier, of targets supports thereon, shoulders upon said supports, and targets pivoted to the supports, having shoulders adapted to engage the support-shoulders.

6. In a moving target, a carrier comprising links, a pair of uprights on each link having shoulders formed thereon, an image pivoted between each pair of uprights and provided with inclined shoulders, engaging the upright shoulders and a depending finger or arm upon each image adapted to contact with the carrier and limit the movement of the target in one direction.

811,637. OIL-CELLAR FOR JOURNAL-BOXES. JAMES F. HILL, Norwalk, Ohio. Filed Apr. 5, 1904. Serial No. 201,691.



Claim.—1. In combination with an oil-cellar having a longitudinal opening, a plate adapted to cover said opening and transversely slotted, and bolts passing through said slots and adapted to hold the plate in place, the plate being transversely slidable with respect to the oil-cellar.

2. An oil-cellar having a longitudinal opening in the bottom of the same, said opening being arranged at one side of the longitudinal center of the cellar, a plate having transverse slots adjacent the ends and the bolts connecting said plate to the bottom of the cellar, the bottom face of the cellar being recessed to permit the lateral movement of the plate for the purpose of uncovering the longitudinal opening.

3. An oil-cellar having a longitudinal opening in the bottom thereof, said opening being arranged at one side of the longitudinal center, the bosses arranged at the ends of said opening, the side walls of said opening extending upwardly into the cellar and diverging at their upper ends, the plate having transversely-slotted ends and the bolts for connecting said plate to the bottom of the cellar, the bottom face of the cellar being recessed to permit the lateral movement of said plate as set forth.

811,638. SKIRT-SUPPORTER. PAUL W. HOFFMAN, Albany, N. Y. Filed Mar. 5, 1904. Serial No. 196,675.

Claim.—1. A skirt-supporter comprising a frame composed of parallel bars bent to form a narrow opening, an enlarged opening, and a second narrow opening, said three openings communicating, a slide operable on the frame, a plate provided with a shank and a stud, a hinge connection between the plate and the slide, and removable means for preventing the head passing through the enlarged opening.

2. A skirt-supporter comprising a frame formed with a shank-opening and an enlarged shank-head opening, a plate provided with a shank having a head, a slide mounted to operate on the frame, a hinge connection between the slide and the plate, a spring-latch pivoted to the frame adjacent the head-opening, the opposite end of the latch being bent to snap over the frame, to prevent the head passing through the head-opening.

811,639. TURBINE-ENGINE. PIM F. HOLSBERGEN, New York, N. Y. Filed May 26, 1904. Serial No. 209,869.

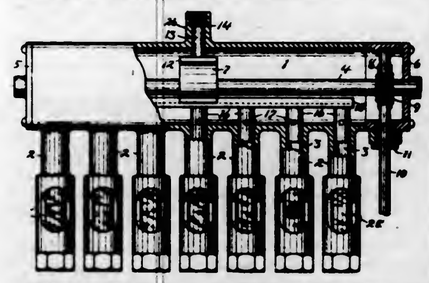
Claim.—1. In a bucket cycle for turbine-engines, the combination of a pair of rings and intermediate buckets, said buckets connected at the ends with the rings respectively, the said connection consisting of a parallel-sided recess of one part and a correspondingly-formed stud of the other part fitting the recess for securing the buckets from shifting relatively to the rings by centrifugal action, said rings and buckets also bolted together.

2. In a bucket cycle for turbine-engines, the combination of a pair of rings and intermediate buckets, said buckets connected at the ends with the rings respectively, the said connection consisting of a parallel-sided recess of one part and a correspondingly-formed integral stud of the other part for securing the buckets from shifting relatively to the rings by centrifugal action, said rings and buckets also bolted together.

3. In a bucket cycle for turbine-engines, the combination of a pair of rings and intermediate buckets, said buckets connected at the ends with the rings respectively, the said connection consisting of a parallel-sided groove in the rings, and parallel integral studs of the buckets fitting therein to secure the buckets from shifting relatively to the rings by centrifugal action, said buckets and rings also bolted together.

4. In a bucket cycle for turbine-engines, the combination of a pair of rings, and intermediate buckets, said buckets connected at the ends with rings respectively, the said connection consisting of a parallel-sided groove in the rings and parallel integral studs of the buckets fitting therein with filling-blocks in the grooves intermediately of the studs, to secure the buckets from shifting relatively to the rings by centrifugal action, said buckets and rings also bolted together.

811,640. OIL-FEEDING DEVICE. THOMAS J. KEHOE, Fort Wayne, Ind. Filed June 9, 1905. Serial No. 264,367.



Claim.—1. In mechanism of the class described, a fountain having a series of independent leads communicating with its lower part; a series of plungers working in the leads respectively and each plunger having means in connection therewith for admission of oil from the fountain into the corresponding lead when the plunger is in uppermost position; outlet-valves arranged one in each of the leads, and located therein beneath the corresponding plungers; and mechanism in connection with the plungers to actuate the same.

2. In mechanism of the class described, a fountain having a series of independent leads communicating with its lower part; a series of plungers working in the leads respectively, and each plunger having means in connection therewith for admission of oil from the fountain into the corresponding lead when the plunger is in uppermost position; outlet-valves arranged one in each of the leads beneath the corresponding plungers, each valve being hollow, open at its top, and closed at its lower end, and having an annular shoulder which rests against a seat in the corresponding lead, and having also a port which affords communication for the downward passage of oil within the lead when the valve is moved below its normal position; compression-springs acting one against each of the valves to hold the latter in normal position; and mechanism in connection with the plungers to actuate the same.

3. In mechanism of the class described, a fountain having one or more leads communicating with its lower part; plungers working in the leads respectively, each being hollow, closed at its top, and open at its lower end, and having a side port which affords communication for the passage of oil from the fountain into the corresponding lead when the plunger is in uppermost position; an outlet-valve in each of the leads at points therein below the corresponding plunger; and mechanism in connection with the plungers to actuate the same.

4. In mechanism of the class described, a fountain having independent leads communicating with its lower part each lead having an outlet-valve; plungers working one in each lead, each plunger having means in connection therewith for admission of oil from the fountain into the corresponding lead when the plunger is in uppermost position; a yoke within the fountain, having connection with each plunger, and having also means in connection therewith to guide its movement; and a shaft extending within the fountain and having an eccentric mounted thereon, the latter engaging the yoke to actuate the same.

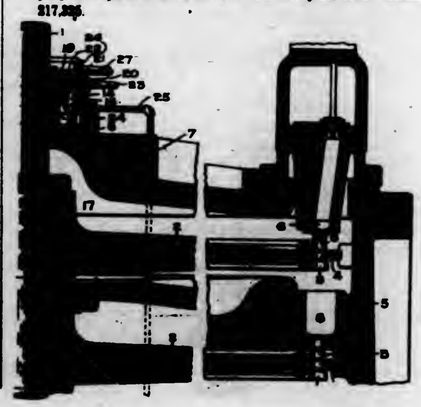
811,641. TRACTION-ENGINE. ALBERT G. KERN, Battlecreek, Mich., assignor to Nichols and Shepard Co., Battlecreek, Mich. Filed July 27, 1905. Serial No. 271,446.

Claim.—1. A combined platform-frame and draw-bar for traction-engines consisting of an open center frame of channel-iron having the side bars thereof connected to the side sheets of the fire-box and bent to form an integral end cross-bar connecting the side bars, and a spring-cushioned draw-bar connected solely to and carried wholly by said end cross-bar.

2. A combined platform-frame and draw-bar support for traction-engines consisting of an open center frame having side bars the end portions of which are deflected downward and connected to the side sheets of the fire-box, and a connecting-bar, and a draw-bar carried by the connecting-bar of the frame.

3. A combined platform-frame and draw-bar support for traction-engines consisting of an open center frame having side bars connected to the side sheets of the fire-box, and a connecting-bar, a draw head or block carried by the connecting-bar and provided with an arcuate spring-seat, a draw-bar passing through the connecting-bar and said head, and a spring interposed between a shoulder on the draw-bar and said seat.

811,642. HYDRAULIC SHAFT-PACKING FOR TURBINES. JAMES P. KEY, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed July 20, 1904. Serial No. 217,395.



Claim.—1. The combination with a rotatable shaft, of a packing therefor comprising two packing-rings, one of which is rotatable, and means for yieldingly supporting one of them.

2. The combination with a rotatable shaft, of a packing therefor comprising two packing-rings, one stationary and the other rotating with the shaft, and means for causing one to bear with a yielding pressure on the other.

3. The combination with a rotatable shaft, of a packing therefor comprising two packing-rings, and means for rendering one of them yieldingly movable lengthwise of the shaft.

4. The combination with a rotatable shaft, of a packing therefor comprising a stationary packing-ring, a packing-ring bearing against the other and rotating with the shaft, and a support for said rotating ring yielding lengthwise of the shaft.

5. The combination with a rotatable shaft, of a packing-ring movable lengthwise thereon, a collar fixed on the shaft, springs between said collar and ring, and a stationary packing-ring bearing against the movable ring.

6. The combination with a rotatable shaft, of a collar fixed thereon, studs in said collar, a packing-ring movable lengthwise on said shaft and having sockets receiving said studs, springs in said sockets abutting on said studs, and a stationary packing-ring bearing on the movable ring.

7. The combination with a rotatable shaft, of a packing therefor comprising two packing-rings, one of which is rotatable, and means for introducing liquid under pressure between said rings.

8. The combination with a rotatable shaft, of a packing therefor comprising a stationary packing-ring, a rotatable packing-ring cooperating therewith, and a pipe conveying water under pressure to the joint between said rings.

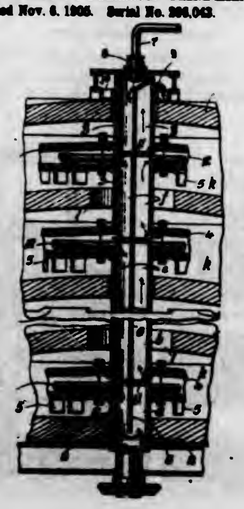
9. The combination with a rotatable shaft, of a packing therefor comprising a stationary packing-ring having a grooved working face, a water-pipe communicating with the groove, and a rotatable packing-ring coöperating with the other.

10. The combination with a rotatable shaft, of a packing therefor comprising a stationary packing-ring having a grooved working face, a water-pipe communicating with the groove, a rotatable packing-ring, and a yielding support therefor on said shaft.

11. The combination with an elastic-fluid turbine, of a casing concentric with the shaft and communicating with the turbine-casing, a packing-ring in said casing having a groove in its working face, a water-pipe communicating with said groove, a rotatable packing-ring on the shaft, and means for draining off the leakage water.

12. The combination with an elastic-fluid turbine, of a casing concentric with the shaft and communicating with the steam-space, a carbon packing-ring in said casing having a groove in its working face, a tubular plug screwed through said casing and into said ring, a yielding packing-ring rotating with the shaft, an internal flange on said casing, and a drain-pipe from said flange.

811,643. ROASTING-FURNACE. FRANK KLEPETKO, New York, N. Y. Filed Nov. 6, 1905. Serial No. 286,043.



Claim.—1. In a rabble apparatus, a hollow shaft having its passage-way divided into longitudinal intercommunicating conduits and means for circulating a cooling medium therethrough in opposite directions, substantially as set forth.

2. In a rabble apparatus, a hollow rotatable shaft having its passage-way divided into longitudinal intercommunicating conduits and means for circulating a cooling medium therethrough in opposite directions, substantially as set forth.

3. In a rabble apparatus, a hollow rotatable shaft having its passage-way divided into longitudinal conduits and means for establishing communication between the conduits at one end of the shaft, substantially as set forth.

4. In a rabble apparatus, a hollow rotatable shaft having its passage-way divided into longitudinal conduits, means for establishing communication between the conduits at one end of the shaft, and means for circulating a cooling medium through the respective conduits in opposite directions, substantially as set forth.

5. In a rabble apparatus, a hollow shaft having its passage-way divided into longitudinal conduits communicating with one another at one end of the shaft, means for circulating a cooling medium through the respective conduits in opposite directions, and inlet means and outlet means for the circulating medium at one end of the shaft, substantially as set forth.

6. In a rabble apparatus, a hollow rabble-shaft having its passage-way divided into longitudinal conduits communicating with one another at the top of the shaft, means for circulating a cooling medium through the respective conduits in opposite directions, and inlet means and outlet means for the circulating medium at the bottom of the shaft, substantially as set forth.

7. In a rabble apparatus, a hollow shaft having its passage-way divided into longitudinal conduits communicating with one another at one end of the shaft, hollow arms leading from said conduits, means for circulating a cooling medium through the respective conduits and arms in opposite directions, and inlet means and outlet means for the circulating medium at one end of the shaft, substantially as set forth.

8. In a furnace having a plurality of hearths, a hollow rabble-shaft passing through the hearths and having its passage-way divided into contiguous intercommunicating conduits, a series of hollow arms leading from said conduits into the several hearths, a series of chambers distributed throughout each conduit and communicating with the hollow arms, and means for feeding a cooling medium into the conduits and circulating the same through the shaft and arms, substantially as set forth.

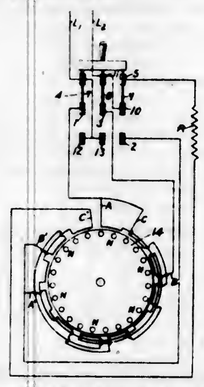
9. In a furnace having a plurality of hearths, a hollow rabble-shaft passing through the hearths and having its passage-way divided into contiguous conduits intercommunicating at one end of the shaft, a series of hollow arms leading from said conduits into the several hearths, a series of chambers distributed throughout each conduit and communicating with the hollow arms, and means for feeding a cooling medium into one of the conduits at the end of the shaft opposite to the intercommunicating passage between the conduits, and causing the same to circulate through the conduits and arms, and means for discharging the cooling medium from the shaft at a point adjacent to the inlet for the circulating medium, substantially as set forth.

10. In a furnace having a plurality of hearths, a hollow rabble-shaft passing through the hearths and having its passage-way divided into contiguous intercommunicating conduits, a series of hollow arms radiating from said conduits and extending into the several hearths, a series of chambers separated by transverse partitions distributed throughout each conduit, distributing-pipes leading from the respective chambers and opening into the adjacent arms, and a feed-pipe adapted to discharge a cooling medium into one of the conduits at a point removed from the point of intercommunication between the conduits, substantially as set forth.

11. In a rabble apparatus, a hollow rabble-shaft having its passage-way divided into longitudinal contiguous conduits having intercommunication at one end of the shaft, means for circulating a cooling medium through the conduits and through the intercommunicating passage, and inlet means and outlet means for the circulating medium at one end of the shaft, substantially as set forth.

12. In a rabble apparatus, a hollow rabble-shaft having its passage-way divided into longitudinal contiguous conduits having intercommunication at one end of the shaft, means for circulating a cooling medium through the conduits and through the intercommunicating passage, and inlet means and outlet means for the circulating medium at the end of the shaft opposite to the point of intercommunication between the conduits, substantially as set forth.

811,644. SINGLE-PHASE ALTERNATING-CURRENT MOTOR. BENJAMIN G. LAMME, Pittsburg, Pa., assignor to Westinghouse Electric & Manufacturing Company, a Corporation of Pennsylvania. Filed Feb. 27, 1904. Serial No. 195,694.



Claim.—1. A single-phase induction-motor having a main primary winding comprising two portions, means for connecting said portions in series for starting and in parallel for running and at the same time changing the number of magnetic poles produced by said winding and an auxiliary winding having a different time constant from that of the main winding.

2. A single-phase induction-motor having a main primary winding comprising two portions, means for connecting said portions in series for starting and in parallel for running and at the same time changing the number of magnetic poles produced by said winding and an auxiliary winding having a different time constant from that of the main winding and adapted to produce the same number of magnetic poles as the main winding under starting conditions.

3. A single-phase induction-motor having a main primary winding comprising two portions, means for connecting said portions in series for starting and in parallel for running and at the same time changing the number of magnetic poles produced by said winding and an auxiliary winding having a different time constant from that of the main winding and connected in parallel therewith for starting and which is adapted to produce the same number of magnetic poles as the main winding under starting conditions.

4. A single-phase induction-motor having a main primary winding comprising two portions, means for connecting said portions in series for starting and in parallel for running, the number of magnetic poles produced by said winding being thereby changed from 2× to X, and an auxiliary winding having a different time constant from that of the main winding and adapted to produce 2× magnetic poles under starting conditions.

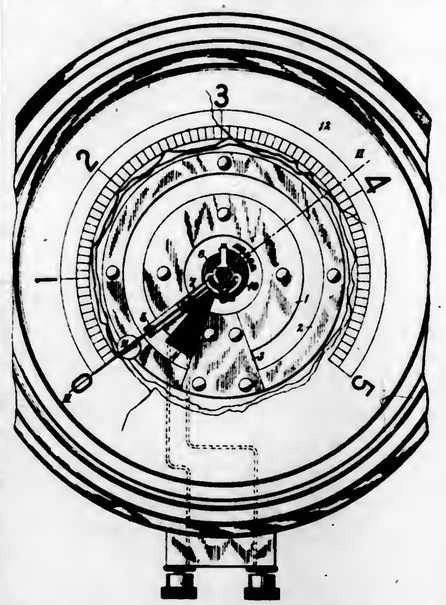
5. A single-phase induction-motor having a main primary winding comprising two portions, means for connecting said portions in series for starting and in parallel for running, the number of magnetic poles produced by said winding being thereby changed from 2× to X, and an auxiliary winding having a different time constant from that of the main winding, in parallel with which it is connected for starting, and adapted to induce 2× magnetic poles.

811,645. ELECTRICAL MEASURING INSTRUMENT. EDWIN B. LEIB, Wilkinsburg, Pa., assignor to Westinghouse Electric & Manufacturing Company, a Corporation of Pennsylvania. Filed Nov. 21, 1903. Serial No. 183,166.

Claim.—1. In an electrical measuring instrument, the combination with an iron core comprising two approximately concentric rings connected together at one side and a stationary winding on a portion of said core, of a movable coil surrounding a portion of said core, means for opposing the movement of said movable coil and means for indicating the degree of said movement.

2. In an electrical measuring instrument, the combination with a laminated iron core comprising two approximately annular portions located the one within the other and an approximately radial portion joining the same, of a stationary winding on one of the annular core portions, a movable coil surrounding said portion, means for opposing the movement of said movable coil and means for indicating the degree of said movement.

3. In an electrical measuring instrument, the combination with a laminated iron core comprising two approximately annular portions located the one within the other and a substantially radial portion joining the same, of a stationary winding on one of the annular portions, a movable coil closed upon itself and comprising one or more turns around said annular portion and adapted for movement about an axis coinciding with the axis of said portion, the plane of the coil being approximately radial to the center of the core, means for opposing the movement of said movable coil and means for indicating the degree of said movement.



4. An electrical measuring instrument having a laminated iron core composed of two approximately annular portions located the one within the other, joined by means of a substantially radial portion and separated by an air-gap that is non-uniform in such manner and degree that the deflections of the instrument are proportional to the measured currents or voltages.

5. In an electrical measuring instrument, a laminated iron core composed of two approximately annular portions the one within the other and joined by means of a substantially radial portion, the inner portion of said core being of an accurate annular shape and the outer portion being of such shape as to produce a non-uniform air-gap between the two portions in order that the deflections of the instrument may be proportional to the measured currents or voltages.

6. In an electrical measuring instrument, actuating means comprising a stationary coil, an iron core comprising two approximately annular, concentric portions and a movable coil that surrounds one of said portions and the magnetic field of which opposes that of the stationary coil.

7. In an electrical measuring instrument, actuating means comprising a stationary coil, a movable coil and an iron core comprising two approximately annular, concentric portions, the movable coil being repelled from the stationary coil by the opposing effects of their magnetic fields.

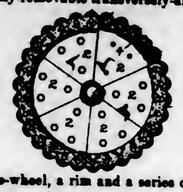
8. An electrical measuring instrument comprising a laminated iron core composed of two approximately annular portions, one within the other and joined by means of a substantially radial portion, a stationary winding on a portion of said core and a movable coil surrounding one of said annular portions.

811,646. VEHICLE-WHEEL TIRE. JOHN H. LOUDEN, Philadelphia, Pa. Filed Apr. 15, 1905. Serial No. 255,663.

Claim.—1. In a vehicle-wheel, a supporting-ring, a pair of flanges, and a series of independent transversely-arranged spiral-spring tread units.

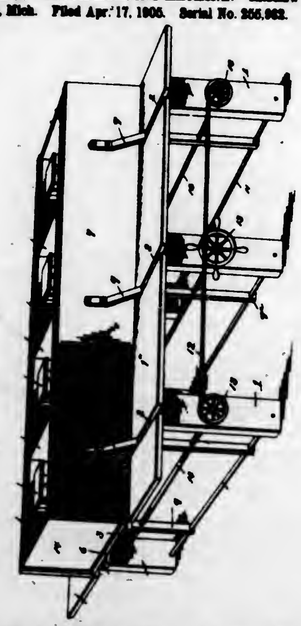
2. A vehicle-wheel comprising a hub, spokes, a rim, and a

2. A vehicle-wheel comprising a hub, spokes, a rim, and a series of independently-removable transversely-arranged spiral-spring tread units.



3. In a vehicle-wheel, a rim and a series of independent alternately-reversed transversely-arranged spiral-spring tread units.

811,647. BLOCK-MOLDING MACHINE. ANDREW J. LOVE, St. Louis, Mich. Filed Apr. 17, 1905. Serial No. 255,962.



Claim.—1. A molding-machine comprising a bed, a bottom board slidable thereon, a pallet supported on the bottom board and slidable therewith, sides slidable laterally to and from the pallet, and end pieces supported between the sides.

2. A molding-machine comprising a bed, a bottom board slidable thereon, a series of pallets supported on the bottom board and slidable therewith, sides slidable to and from the pallets, and removable partitions and end boards held between the side boards.

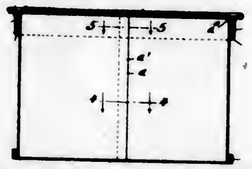
3. A molding-machine comprising a bed having crosswise slots, a bottom board slidable lengthwise on the bed, a row of pallets on the bottom board, opposite sides slidable laterally to and from the pallets and having standards extending down through the slots, right and left threaded screws extending across under the bed and engaging the standards to advance or retract the sides, and partitions and end pieces between the sides.

4. In a multiple-block-molding machine, in combination, a bed, a bottom board supported thereon and extending lengthwise thereof, and slidable lengthwise thereon, and constructed to support the blocks and to withdraw the same from between opposite sides of the molds, side boards adjustable laterally on the bed, and mold-sections between the side boards and upon the bottom board.

5. The combination with a mold-bottom, of a hollow core, and sliding pins secured to the side walls of the core and adapted to be pushed down into said bottom to hold the core in place in the mold.

811,648. SHEET-METAL CAN. HENRY MAGARTHY, New York, N. Y., assignor to American Can Company, New York, N. Y., a Corporation of New Jersey. Filed May 31, 1905. Serial No. 263,976.

Claim.—1. In a large-diameter can for containing heavy materials, the combination with a can-body having a wide integral downwardly-projecting fold or ring, and a wide integral upwardly-projecting fold or ring terminating in a roll at its upper edge, the meeting ends of said folds or rings abutting together and being united by solder, and the meeting edges of the can-body blank overlapping each other and soldered together at the side seam of the can-body, of a slip-cover having an integral wide flange tightly fitting between and engaging said integral folds or rings of the can-body, said outer integral fold or ring of the can-body having a roll at its upper edge to facilitate the entrance of the flange of the cover between the same and said inner downwardly-projecting fold whereby the frictional engagement of the cover with the can-body is increased and the upper end or mouth of the can-body stiffened and strengthened and prevented from becoming distorted when the cover is being removed or replaced, substantially as specified.



2. In a sheet-metal can, the combination with a can-body having a plurality of external wide folds or integral rings at its upper end, said rings being united and abutting together at their meeting ends, and the meeting edges of the can-body blank overlapping each other and soldered together at the side seam of the can-body, of a cover having an externally-projecting shoulder or bead and a wide slip-cover flange fitting between and engaging said integral folds or rings of the can-body, said outer integral fold or ring of the can-body having a roll at its upper edge, substantially as specified.

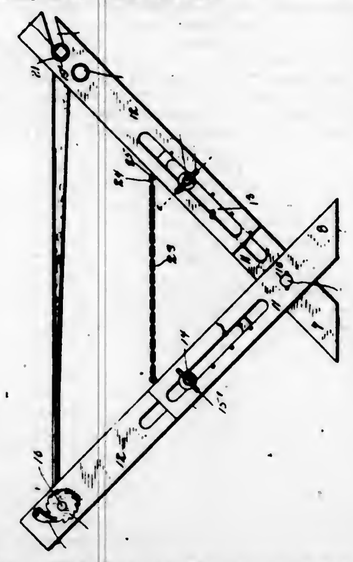
3. In a sheet-metal can, the combination with a can-body having a plurality of external wide folds or integral rings at its upper end, said rings being united and abutting together at their meeting ends, and the meeting edges of the can-body blank overlapping each other and soldered together at the side seam of the can-body, of a cover having a wide slip-cover flange fitting between and engaging said integral folds or rings of the can-body, said outer integral fold or ring of the can-body having a roll at its upper edge, said cover having an externally-projecting shoulder or bead and an annular recess forming with said roll of said outer fold or ring of the can-body, a channel to receive a sealing material, substantially as specified.

811,649. SHEET-METAL CAN. ISAAC J. MARCUSE, Richmond, Va., assignor to American Can Company, New York, N. Y., a Corporation of New Jersey. Filed Aug. 28, 1905. Serial No. 276,267.

Claim.—1. In a can the combination with a top or upper head having a screw-neck furnished with an inturned flange at its upper edge, said inturned flange being provided with an annular recess or countersink to receive the rim of a rotary closing-plate, of a screw-cap having a segmental opening therein and a rotary closing-plate inside the cap and pivoted thereto, and fitting at its outer circular rim portion in the annular recess in said inturned flange of the screw-neck, said rotary closing-plate fitting between the screw-cap and screw-neck of the can and guided and supported thereby, substantially as specified.

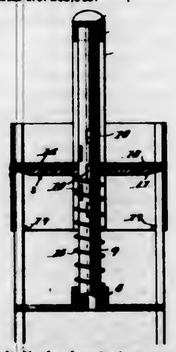
2. In a can the combination with a top or upper head furnished with a screw-neck, provided with an inturned flange at its upper edge, of a screw-cap having a segmental opening therein and a rotary closing-plate fitting inside the cap and between the cap and the inturned flange of the screw-neck, one of said screw parts being furnished with a recess to receive said rotary closing-plate, said rotary closing-plate being supported and guided at its circular rim portion by said screw-cap and screw-neck, substantially as specified.

811,650. QUILTING-FRAME. DORA MASSEY, Dubberville, Tex. Filed Aug. 17, 1904. Serial No. 221,116.



Claim.—A quilting-frame comprising two pairs of members pivotally connected adjacent to their lower ends, each member comprising a lower and an upper portion having alining longitudinal slots which are notched along one edge, a clamping-bolt engaged through each pair of alining slots and having a lip adapted to engage a pair of notches in the sides of the corresponding slots, thumb-nuts engaged with the bolts, said bolts being rotatable with their lips into and out of engagement with the notches, a flexible tie connecting the lower portions of the members at each side of the frame, and fabric-carrying rollers mounted in the upper ends of the members.

811,651. FRUIT-DISPLAY BOX. GEORGE B. MILLER, Riverside, Cal., assignor of one-half to Edward L. Pequegnat, Riverside, Cal. Filed May 31, 1905. Serial No. 263,049.



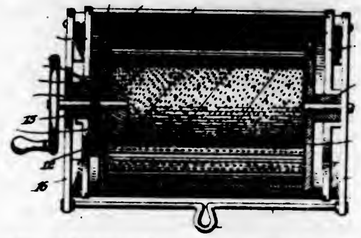
Claim.—1. A fruit-display box including a spring-pressed bottom and a guide-standard therefor constituting a ventilator.

2. A fruit-display box including a spring-pressed bottom, a yielding fruit-supporting surface combined therewith, and means for guiding the bottom and ventilating the fruit contained within the box.

3. A fruit-display box including a tubular standard provided with orifices, a spring surrounding the standard, and a bottom guided by the standard and resting upon the spring.

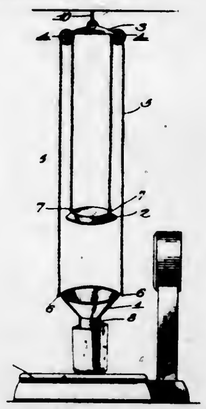
4. A fruit-display box including a spring-pressed bottom, a yielding fruit-supporting surface combined therewith, means for guiding the bottom and ventilating the fruit contained within the box, and means for limiting the downward movement of the bottom.

811,652. POTATO-PARER. HIRAM A. MITCHELL and THOMAS D. SINGLETON, Fall River, Mass. Filed Nov. 19, 1904. Serial No. 233,479.



Claim.—A machine for paring poratoes and the like, comprising a trough, levers hinged near one side thereof, a shaft mounted on said levers and having secured to it a cylinder with roughened surface, an outer concentric cylinder rotatably supported on said shaft, an internal gear on one end of said outer cylinder, a pinion on the shaft, and an idle gear journaled on one of said levers between said pinion and internal gear.

811,653. SACK-FILLER. HERMAN E. MOSELEY, Rockymount, Va. Filed Feb. 9, 1905. Serial No. 244,979.



Claim.—1. A sack-filler embodying a suspended funnel, and a cover constituting a counterbalance.

2. A sack-filler embodying a funnel, a cover constituting a counterbalance, and suspending elements detachably connected with the funnel and the cover.

3. A sack-filler embodying a funnel, a cover therefor, constituting a counterbalance, an overhead support carrying sheaves, and flexible suspending elements engaging the sheaves and having their terminals connected respectively to the funnel and to the cover.

4. A sack-filler comprising a funnel provided with hooks, a cover therefor constituting a counterbalance and provided with hooks, and suspending elements having their terminals in engagement with the hooks.

811,654. ELECTRIC-WAVE DETECTOR. THOMAS J. MURPHY, New York, N. Y. Filed Dec. 17, 1904. Serial No. 237,206.

Claim.—1. In an electric-wave detector, electrodes in a magnetic field and bridged by magnetizable conducting particles, with means of producing motion between the said electrodes.

2. In an electric-wave detector, the combination of magnetizable electrodes in a magnetic field and bridged by magnetic conducting particles, together with means of restoring the "detector"

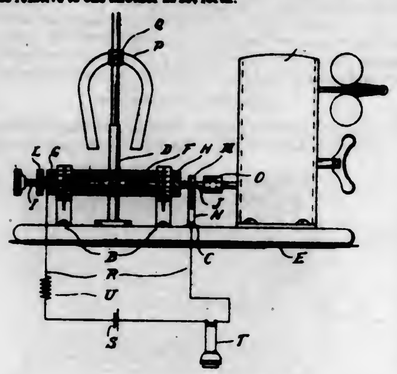
to its normal condition of high resistance, by a movement of the electrodes relative to one another as set forth.

with the roll of material as it is wound, and means for applying an adhesive to the web, substantially as described.

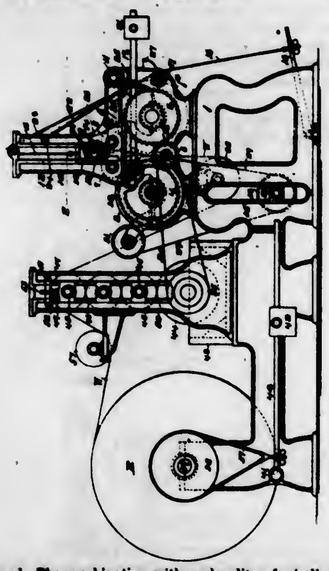
a roll, mechanism for driving the winding-rolls, a weight adapted to move said support to disconnect the winding-rolls from the driving

cuit, means for holding the second-mentioned means in its position assumed when the current is interrupted thereby, and mechanical

to its normal condition of high resistance, by a movement of the electrodes relative to one another as set forth.



811,655. WINDING-MACHINE. ALBERT B. MCCAULEY, Denver, Colo. Filed Sept. 21, 1904. Serial No. 225,227.



Claim.—1. The combination with a plurality of winding-rolls adapted to wind a web of material into a roll, of a laterally-displaceable ironing-roll having a greater surface speed coacting therewith and contacting with the roll of material as it is wound, substantially as described.

2. The combination with a plurality of winding-rolls adapted to wind a web of material into a roll, of a laterally-displaceable ironing-roll having a greater surface speed coacting therewith and contacting with the roll of material as it is wound, mechanism for driving said winding-rolls, and automatically-operating means for disconnecting said winding-rolls and driving mechanism at a predetermined point in the winding operation, substantially as described.

3. The combination with a plurality of winding-rolls adapted to wind a web of material into a roll, of a laterally-displaceable ironing-roll having a greater surface speed coacting therewith and contacting with the roll of material as it is wound, mechanism for driving said winding-rolls, and means controlled by said ironing-roll for disconnecting said winding-rolls and driving mechanism at a predetermined point in the winding operation, substantially as described.

4. The combination with a plurality of winding-rolls adapted to wind a web of material into a roll, of a laterally-displaceable ironing-roll having a greater surface speed coacting therewith and contacting with the roll of material as it is wound, and means for applying an adhesive to the web, substantially as described.

5. The combination with a plurality of winding-rolls adapted to wind a web of material into a roll and mechanism for driving said rolls, of a laterally-displaceable ironing-roll coacting therewith and contacting with the roll of material as it is wound, and connections for driving said ironing-roll independently of said winding-rolls, whereby its rotation may be continued after rotation of said winding-rolls has been arrested, substantially as described.

6. The combination with a plurality of winding-rolls adapted to wind a web of material into a roll and mechanism for driving said rolls, of a laterally-displaceable ironing-roll coacting therewith and contacting with the roll of material as it is wound, connections for driving said ironing-roll independently of said winding-rolls, whereby its rotation may be continued after rotation of said winding-rolls has been arrested, and automatically-operating means for disconnecting said winding-rolls and their driving mechanism at a predetermined point in the winding operation, substantially as described.

7. The combination with a plurality of winding-rolls adapted to wind a web of material into a roll and mechanism for driving said rolls, of a laterally-displaceable ironing-roll coacting therewith and contacting with the roll of material as it is wound, connections for driving said ironing-roll independently of said winding rolls, whereby its rotation may be continued after rotation of said winding-rolls has been arrested, and means controlled by said ironing-roll for disconnecting said winding-rolls and their driving mechanism at a predetermined point in the winding operation, substantially as described.

8. The combination with a movable support, of a plurality of winding-rolls carried thereby adapted to wind a web of material into a roll, mechanism for driving the rolls, and automatically-operating means for moving the support to disconnect the winding-rolls from the driving mechanism at a predetermined point in the winding operation, substantially as described.

9. The combination with a swinging support, of a plurality of winding-rolls carried thereby adapted to wind a web of material into a roll, mechanism for driving the rolls, and automatically-operating means for swinging the support to disconnect the winding-rolls from the driving mechanism at a predetermined point in the winding operation, substantially as described.

10. The combination with a movable support, of a plurality of winding-rolls carried thereby adapted to wind a web of material into a roll, mechanism for driving the roll, automatically-operating means for moving the support to disconnect the winding-rolls from the driving mechanism at a predetermined point in the winding operation, an ironing-roll also mounted in said support and coacting with said winding-rolls and contacting with the roll of material as it is wound, and connections for driving said ironing-roll independently of the winding-rolls whereby the rotation of said ironing-roll may be continued after rotation of said winding-rolls has ceased, substantially as described.

11. The combination with a swinging support, of a plurality of winding-rolls carried thereby adapted to wind a web of material into a roll, mechanism for driving the rolls, automatically-operating means for swinging the support to disconnect the winding-rolls from the driving mechanism at a predetermined point in the winding operation, an ironing-roll also mounted in said support and coacting with said winding-rolls and contacting with the roll of material as it is wound, and connections for driving said ironing-roll independently of the winding-rolls whereby the rotation of said pressing-roll may be continued after rotation of said winding-rolls has ceased, substantially as described.

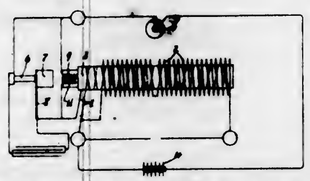
12. The combination with a movable support, of a plurality of winding-rolls carried thereby adapted to wind a web of material into a roll, mechanism for driving the winding-rolls, an ironing-roll coacting with said winding-rolls and contacting with the roll of material as it is wound, and means controlled by said ironing-roll for moving the support to disconnect the winding-rolls from their driving mechanism at a predetermined point in the winding operation, substantially as described.

13. The combination with a swinging support, of a plurality of winding-rolls carried thereby adapted to wind a web of material into a roll, mechanism for driving the winding-rolls, an ironing-roll coacting with said winding-rolls and contacting with the roll of material as it is wound, and means controlled by said ironing-roll for swinging the support to disconnect the winding-rolls from their driving mechanism at a predetermined point in the winding operation, substantially as described.

14. The combination with a movable support, of a plurality of winding-rolls carried thereby adapted to wind a web of material into a roll, mechanism for driving the winding-rolls, a weight adapted to move said support to disconnect the winding-rolls from the driving mechanism at a predetermined point in the winding operation, an ironing-roll coacting with said winding-rolls and contacting with the roll of material as it is wound, a latch mechanism holding said weight out of operative position and means moving with the ironing-roll for releasing the latch mechanism, substantially as described.

15. The combination with a swinging support, of a plurality of winding-rolls carried thereby adapted to wind a web of material into a roll, mechanism for driving the winding-rolls, a weight adapted to swing said support to disconnect the winding-rolls from the driving mechanism at a predetermined point in the winding operation, an ironing-roll coacting with said winding-rolls and contacting with the roll of material as it is wound, a latch mechanism holding said weight out of operative position and means moving with the ironing-roll for releasing the latch mechanism, substantially as described.

811,656. SPARK-COIL. CHARLES P. L. HOXIE, Syracuse, N. Y. Filed Sept. 26, 1904. Serial No. 226,269.



Claim.—1. The combination of a primary circuit, a secondary circuit, means for interrupting the current in the primary circuit, means for holding the first-mentioned means in its position assumed when the current is interrupted thereby, and mechanical means for making and breaking the primary circuit, substantially as and for the purpose described.

2. The combination of a primary circuit, a secondary circuit, means actuated by the current in the primary circuit for interrupting the current in said primary circuit, electromagnetic means for holding the first-mentioned means in its position assumed when the current is interrupted thereby, and mechanical means for making and breaking the primary circuit, substantially as and for the purpose specified.

3. The combination of a primary circuit, a secondary circuit, means for breaking the primary circuit to interrupt the current therein, electromagnetic means for holding the first-mentioned means in its position assumed when the current is interrupted thereby, said electromagnetic means being connected in the primary circuit to bridge the gap formed in the primary circuit by the first-mentioned means to interrupt the current therein, and mechanical means for making and breaking the primary circuit, substantially as and for the purpose set forth.

4. The combination of a primary circuit, a secondary circuit, means actuated by the current in the primary circuit for breaking the primary circuit to interrupt the current therein, electromagnetic means for holding the first-mentioned means in its position assumed when the current is interrupted thereby, said electromagnetic means being connected in the primary circuit to bridge the gap formed in the primary circuit by the first-mentioned means to interrupt the current therein and being of greater resistance than the part of the primary circuit through which no current passes when the first-mentioned means has interrupted the current, and mechanical means for making and breaking the primary circuit, substantially as and for the purpose described.

5. The combination of a primary circuit, a secondary circuit, means for interrupting the current in the primary circuit comprising a terminal in the primary circuit, an armature movable relatively to the terminal for making and breaking the primary circuit at the terminal, electromagnetic means for holding the first-mentioned means in its position assumed when the current is interrupted thereby, and mechanical means for making and breaking the primary circuit, substantially as and for the purpose specified.

6. The combination of a primary circuit, a secondary circuit, electromagnetic means having a core, and conductors connected respectively in said circuits, means for interrupting the current in the primary circuit, the operation of said means for interrupting the current being effected by the magnetic action of the core, means for causing the second-mentioned means to return to its position assumed before the operation thereof to interrupt the current in the primary circuit, electromagnetic means for holding the first-mentioned means in its position assumed when the current is interrupted thereby, said electromagnetic means having a core arranged endwise relatively to the first-mentioned core and forming essentially a continuation thereof, and mechanical means for making and breaking the primary circuit, substantially as and for the purpose specified.

7. The combination of a primary circuit, a secondary circuit, means for interrupting the current in the primary circuit, said means including an armature, and a plurality of means connected in the primary circuit for attracting the armature, one of said means continuing to attract the armature after the other has lost its power to prevent the return of the armature, substantially as and for the purpose described.

8. The combination of a primary circuit, a secondary circuit, electromagnetic means having a core, and conductors connected respectively in said circuits, means for interrupting the current in the primary circuit, the operation of said means for interrupting the current being effected by the magnetic action of the core, means for causing the second-mentioned means to return to its position assumed before the operation thereof to interrupt the current in the primary circuit, electromagnetic means for holding the first-mentioned means in its position assumed when the current is interrupted thereby, said electromagnetic means having a core arranged endwise relatively to the first-mentioned core and forming essentially a continuation thereof, and mechanical means for making and breaking the primary circuit, substantially as and for the purpose specified.

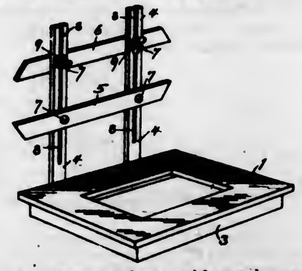
9. The combination with an induction-coil, of means for making and breaking the primary circuit of the induction-coil, and means for breaking and holding open the primary circuit during the time the first-mentioned means is in its position assumed when making the primary circuit.

10. In an induction-coil, a core, a primary conductor, and electromagnetic means having a conductor connected in circuit with the primary conductor, and a core fixed to the first-mentioned core, substantially as and for the purpose set forth.

11. In combination, an armature, the primary conductor of an induction-coil and means for attracting the armature independently of the primary conductor, said means being in electrical connection with the primary conductor when the circuit therethrough is complete, substantially as and for the purpose specified.

12. In an induction-coil, a core, a primary conductor, electromagnetic means arranged end to end relatively to the core and having a conductor connected in circuit with the primary conductor when the circuit through said primary conductor is complete, a core forming essentially a continuation of the first-mentioned core, and a conducting-shield encircling the conductor of the electromagnetic means, substantially as and for the purpose described.

811,657. COUCH-DISPLAY TRUCK. THOMAS B. O'BRIEN, Chicago, Ill. Filed Nov. 27, 1905. Serial No. 289,231.



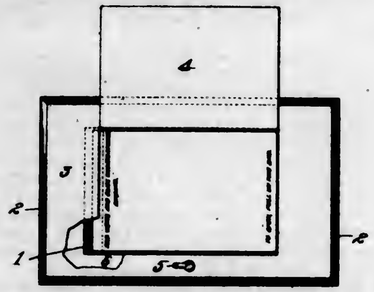
Claim.—1. A display truck or stand for couches, comprising a platform about twenty by thirty inches mounted on wheels and provided with a pair of slotted standards near one edge of the platform and a pair of horizontal bars provided with perforations and screw-bolts working through the perforations and slots and adapted to clamp the legs of the couch, as and for the purpose specified.

2. A display truck or stand for couches comprising a platform mounted on wheels and provided with a pair of slotted standards attached near one edge, with their lower ends extended below the platform to near the level of the bottom of the wheels and located at a distance from the adjacent wheels so as to be adapted to strike the floor and lift the said wheels off of the floor when the truck is slightly tilted toward the standards, as and for the purpose specified.

3. A display truck or stand for couches comprising a platform mounted on wheels and provided with clamping devices for holding a couch in a vertical position on the platform and a pendent part

at one edge of the platform located at a distance from the adjacent wheels so as to be adapted to strike the floor and lift said wheels off of the floor when the platform is slightly tilted from the horizontal, toward said pendent part, as and for the purpose specified.

811,658. FOLDING VIEW-HOLDER. PERRY M. O'CONNOR, St. Louis, Mo. Filed Aug. 31, 1903. Serial No. 171,492.



Claim.—1. In a folding view-holder, the combination with a back piece, a frame-piece, a cover-piece having a flap and having an overhanging portion, and folding views attached at one end to the casing, their opposite ends being designed to fit under an overhanging portion of the cover-piece; substantially as described.

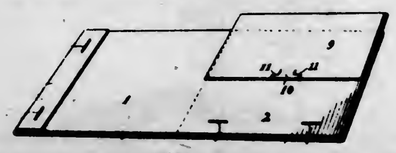
2. In a folding view-holder, the combination with a back piece, of a frame-piece, a cover-piece having an overhanging edge 8 extending inwardly beyond the frame-piece, a bottom piece 6 for securing one edge of the folding views in position, the opposite edges of said folding views being designed to fit under the overhanging portion 8, a flap 4, and means for securing said flap in position; substantially as described.

3. A card provided with a recess on one side, one wall of which recess overhangs, and folding views designed to fit under said overhanging portion; substantially as described.

4. A card provided with a recess opening on one side only of the card, one wall of said recess overhanging, and folding views designed to fit under said overhanging wall; substantially as described.

5. A card provided with a recess having an overhanging wall, a foldable device containing illustrations or the like fitted in said recess and under said overhanging wall, and a movable cover for closing and opening the recess; substantially as described.

811,659. FOLDING BOX. PETER O'RILEY, Grand Rapids, Mich., assignor of one-half to Norman A. Perkins, Grand Rapids, Mich. Filed Jan. 31, 1905. Serial No. 243,573.

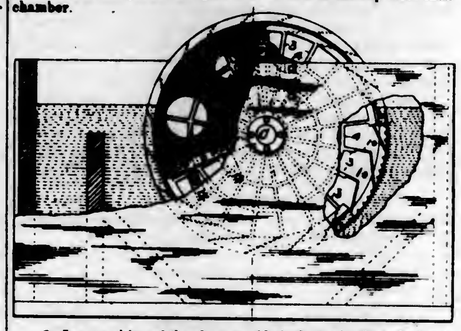


Claim.—A folding box comprising sides hinged to each other and adapted to fold in two parallel planes, one of said sides having a recess in its upper edge, a bottom having at one side a hinged extension secured to one of the said sides, and a hinged extension at the other side of the bottom, and provided with a T-shaped portion adapted to engage the recess and support the bottom.

811,660. PULP-TREATING MACHINE. HOWARD PARKER, Hudson, N. H., assignor to Improved Paper Machinery Company, Canton, Me., and Hudson, N. H., a Corporation of Maine. Filed Jan. 3, 1905. Serial No. 239,269.

Claim.—1. In combination, in a machine of the class specified, the tank, the cylinder revolubly mounted therein, compartments formed in the interior of the cylinder, and the suction-cap located in operative relation to the cylinder, and having independent suction-chambers.

2. In combination, in a machine of the class specified, the tank, the cylinder revolubly mounted therein, compartments formed in the interior of the cylinder, the suction-cap located in operative relation to the cylinder, independent chambers in the cap, inlet-ports through the rear wall of said cap into each chamber, said ports forming communication between the chambers and the compartments in the cylinder, and outlet-ports through the front wall of the cap from each chamber.



3. In a machine of the class specified, the tank, the pulp-forming cylinder revolubly mounted in the tank, compartments arranged in the interior of the cylinder, and means for subjecting each compartment to suction action of varying intensities.

4. In a machine of the class specified, the tank containing the solution, the cylinder revolubly mounted in the tank partly immersed in the solution, compartments arranged in the interior of said cylinder, and means for subjecting each compartment, first, to the action of a suction of considerable volume but slight intensity, and subsequently subjecting each compartment to a suction action of considerable intensity, substantially as described and for the purposes set forth.

5. The cylinder comprising in its construction suitable heads, and rods extending from end to end of the cylinder and having their ends located in the heads, wire wound spirally on said rods, a coating of solder or similar material applied to the wire for a short distance from each end of the cylinder, the sieve or screen applied over the whole surface of the cylinder, and an impervious coating applied on the screen at each end of the cylinder over the solder, substantially as described and for the purposes set forth.

6. The cylinder comprising in its construction suitable heads, and rods extending from end to end of the cylinder and having their ends located in the heads, wire wound spirally on said rods, said wire being wound more closely at the ends of the cylinder than in the center, a coating of solder or similar material applied to each end over the closely-wound wire, the sieve or screen applied over the whole surface of the cylinder, and an impervious coating applied on the screen at each end of the cylinder over the closely-wound wire, substantially as described.

7. In a cylinder in combination the shaft, the heads, partitions supported along their inner edges by the shaft and at their ends by the heads, notches in the upper edges of the partitions, the circumferential rings located in the notches, the lengthwise rods supported on the rings, the upturned stiffening-flange secured to the upper edges of the partitions, notches formed in the rods, and in the stiffening-flanges, wire wound about the cylinder and resting in the notches in the rods and flanges, and a sieve or screen applied over the whole to form the surface of the cylinder.

8. In a cylinder, in combination, the shaft having lengthwise grooves in its surfaces, the heads supported on the shaft and having peripheral rims, spokes, and lateral braces from spoke to spoke, partitions having their inner edges located in the grooves in the shaft and their outer edges slotted to receive the frame-rings and their ends secured by the spokes, said rings and a pervious shell, substantially as described.

9. In a machine of the class specified, the cylinder having a perforated shell, radial partitions extending from the shaft to the shell forming compartments within the cylinder, and U-shaped troughs secured at each side to adjacent partitions, substantially as described.

10. In a machine of the class specified, the cylinder having a perforated shell, radial partitions extending from the shaft to the shell forming compartments within the cylinder, and U-shaped troughs secured at each side to adjacent partitions, said troughs being inclined downwardly toward the ends of the cylinder, substantially as described.

11. A cylinder having heads, a shell, radial partitions extending lengthwise of the cylinder and having upwardly-extending continuous stiffening-flanges along their outer edges.

12. A cylinder having heads, a shell, radial partitions extending lengthwise of the cylinder having their edges slotted for the reception of rings, said rings, and an upstanding continuous flange secured to the outer edges of said partitions.

13. In a cylinder comprising heads, a shell, and radial partitions for supporting said shell, plates secured to the outer edges of said partitions at an angle thereto, and upstanding continuous stiffening-flanges secured to the edges of said plates.

14. A cylinder having heads, a shell, and radial partitions for supporting said shell, plates secured to the outer edges of said partitions at an angle thereto, said plates being slotted, and an upwardly-extending continuous stiffening-flange secured to the edge of said plate, substantially as described and for the purposes set forth.

811,661. DETACHABLE FASTENER AND BUTTON. JULIUS PINCUS, Norfolk, Va. Filed Jan. 26, 1905. Serial No. 242,761.

Claim.—1. A button or fastener comprising a beaded disk having a shank of an approximately elliptic cross-section, a rectangular slot passing through the shank, a flexible imperforate convex shell member, said disk being crimped to the shell member, a separable forked latch member adapted to engage the lower surface of the disk, a fastening-shank on the said latch member, a recessed block attached to and actuated by the convex shell portion for releasing the latch member from the disk, and a set of curved independent springs attached to the recessed block and adapted to bear upon the lower surface of the disk to restore the convex shell and the said block to their normal positions.

2. A fastener for buttons and the like comprising a perforated disk portion having a rounded edge, a perforated shank having an oval shape in cross-section, a flexible imperforate semispherical shell affixed to the said rounded edge of the disk, a detachable latch member having attachment-prongs thereon at one of its ends, a movable recessed block attached to the said imperforate shell, a set of diverging independent springs attached thereto and adapted to bear upon the lower surface of the disk when the shell is depressed for disengaging the latch member.

811,662. SHIRT-SLEEVE. TAYLOR PORTEAR, Jonesboro, Ark. Filed Nov. 15, 1904. Serial No. 232,883.

Claim.—1. A shirt-sleeve provided with a foldable lower portion adapted to be successively and accurately folded or rolled up on definite lines, and consisting of an enlarged bottom portion, a tapered portion, and an upper portion of less width than the lower enlarged portion.

2. A shirt-sleeve having a foldable lower portion having means for enabling it to be successively folded or rolled up to shorten it, and a stiffening-piece of a length less than the width of the sleeve to avoid interfering with the flexible character thereof, said stiffening-piece forming a guide for folding the sleeve.

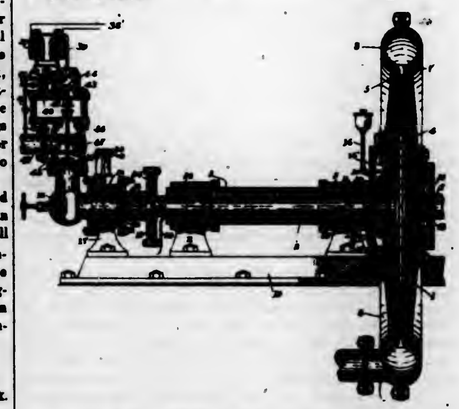
3. A shirt-sleeve having a foldable lower portion enlarged at the bottom, a stiffening-piece of a width less than that of the sleeve secured to the same at the enlarged portion of the same, and means located adjacent to the stiffening-piece for drawing the enlarged portion of the sleeve together.

4. A shirt-sleeve having a foldable lower portion consisting of upper and lower portions of different widths and an intermediate connecting tapered portion, a longitudinal tab secured to the said upper portion and arranged within the area of the foldable portion, and a cuff attachment provided with means for detachably engaging the tab.

5. A shirt-sleeve having a lower foldable portion enlarged at the bottom, a cuff attachment, means for securing the same to the sleeve, and fastening devices secured to the enlarged portion of the sleeve in spaced relation and adapted to engage each other for drawing the enlarged portion of the sleeve together.

6. A shirt-sleeve having a foldable lower portion formed from a blank provided at its bottom with correspondingly-shaped portions adapted to be folded to provide an inner lining, said correspondingly-shaped portions when folded consisting of an enlarged bottom portion having approximately parallel side edges, a tapering intermediate portion having converging side edges, and an upper smaller portion.

811,663. TURBINE. FREDERICK W. REEVES, Allegheny, Pa., assignor of one-half to John R. James, Pittsburg, Pa. Filed Apr. 14, 1904. Serial No. 203,103.



Claim.—1. In a steam-turbine, a primary wheel having internal tangentially-disposed outwardly-diverging nozzles opening into the periphery thereof and driven in a direction opposite the flow of steam by the initial energy of the steam acting in said nozzles, and a secondary wheel having tangentially-disposed peripheral vanes therein and driven in an opposite direction to that of the primary wheel by the velocity of the steam as it issues from the primary wheel nozzles, said secondary wheel entirely inclosing said primary wheel.

2. In a steam-turbine, a primary wheel having internal tangentially-disposed outwardly-diverging nozzles opening into the periphery thereof and driven in a direction opposite the flow of steam by the initial energy of the steam acting in said nozzles, and a secondary wheel having peripheral vanes therein and driven in an opposite direction to that of the primary wheel by the velocity of the steam as it issues from the primary-wheel nozzles, said secondary wheel entirely inclosing said primary wheel.

3. In a steam-turbine, a primary wheel having internal tangentially-disposed outwardly-diverging nozzles opening into the periphery thereof and driven in a direction opposite the flow of steam by the initial energy of the steam acting in said nozzles, and a secondary wheel having peripheral vanes therein and driven in an opposite direction to that of the primary wheel by the velocity of the steam as it issues from the primary-wheel nozzles, said secondary wheel entirely inclosing said primary wheel and provided with liquid sealing members at its axis.

4. In a steam-turbine, a primary wheel having internal tangentially-disposed outwardly-diverging nozzles opening into the periphery thereof adapted to be driven in one direction by the steam acting in said nozzles, and a secondary wheel the periphery of which

is provided with hook-shaped vanes extending over the periphery of said primary wheel and adapted to be driven in an opposite direction to that of said primary wheel, the vanes of said secondary wheel being disposed with their hook-shaped portion inwardly.

5. In a steam-turbine, a primary wheel having internal tangentially-disposed outwardly-diverging nozzles opening into the periphery thereof adapted to be driven in one direction by the steam acting in said nozzles, and a secondary wheel the periphery of which is provided with hook-shaped vanes extending over the periphery of said primary wheel and adapted to be driven in an opposite direction to that of said primary wheel, the vanes of said secondary wheel being disposed with their hooked-shaped portion inwardly and of increased thickness at their middle so as to contract the space therebetween at that point.

6. In a steam-turbine, a primary wheel having internal tangentially-disposed outwardly-diverging nozzles opening into the periphery thereof adapted to be driven in one direction by the steam acting in said nozzles, and a secondary wheel the periphery of which is provided with hook-shaped vanes extending over the periphery of said primary wheel and adapted to be driven in an opposite direction to that of said primary wheel, the vanes of said secondary wheel being disposed with their hook-shaped portion inwardly and their straight portions tangentially in an opposite direction to those of said primary wheel.

7. In a steam-turbine, a primary wheel having internal tangentially-disposed outwardly-diverging nozzles opening into the periphery thereof adapted to be driven in one direction by the steam acting in said nozzles, and a secondary wheel the periphery of which is provided with hooked-shaped vanes extending over the periphery of said primary wheel and adapted to be driven in an opposite direction to that of said primary wheel, the vanes of said secondary wheel being disposed with their hook-shaped portion inwardly and their straight portions tangentially in an opposite direction to those of said primary wheel.

8. In a steam-turbine, a primary wheel having internal tangentially-disposed outwardly-diverging nozzles opening into the periphery thereof adapted to be rotated in one direction by the steam acting in said nozzles, and a secondary wheel entirely inclosing said primary wheel the periphery of which is provided with hook-shaped vanes adapted to be driven in an opposite direction to that of said primary wheel by the action of the steam on said vanes as it issues from the nozzles of said primary wheel.

9. In a steam-turbine, a primary wheel having internal tangentially-disposed outwardly-diverging nozzles opening into the periphery thereof adapted to be rotated in one direction by the steam acting in said nozzles, and a secondary wheel entirely inclosing said primary wheel the periphery of which is provided with hook-shaped vanes disposed tangentially in an opposite direction to the nozzles of said primary wheel and adapted to be driven in an opposite direction to that of said primary wheel by the action of the steam on said vanes as it issues from the nozzles of said primary wheel.

10. In a steam-turbine, a primary wheel having internal tangentially-disposed outwardly-diverging nozzles opening into the periphery thereof adapted to be rotated in one direction by the steam acting in said nozzles, a secondary wheel entirely inclosing said primary wheel the periphery of which is provided with hook-shaped vanes adapted to be driven in an opposite direction to that of said primary wheel by the action of the steam on said vanes as it issues from the nozzles of said primary wheel, and a liquid seal between the shaft of said primary wheel and wall of said secondary wheel.

11. In a steam-turbine, a primary wheel having internal tangentially-disposed outwardly-diverging nozzles opening into the periphery thereof adapted to be rotated in one direction by the steam acting in said nozzles, a secondary wheel entirely inclosing said primary wheel the periphery of which is provided with hook-shaped vanes disposed tangentially in an opposite direction to the nozzles of said primary wheel and adapted to be driven in an opposite direction to that of said primary wheel by the action of the steam on said vanes as it issues from the nozzles of said primary wheel, and a liquid seal between the shaft of said primary wheel and wall of said secondary wheel.

12. In a steam-turbine, a hollow rotatable steam-conducting shaft communicating at one end with a stationary steam-supply member, a liquid sealing device interposed therebetween, a primary wheel carried by the opposite end of said hollow shaft and provided with internal tangentially-disposed outwardly-diverging nozzles opening out into the periphery of said wheel and communicating with said hollow shaft, a secondary wheel mounted upon a shaft and entirely inclosing said primary wheel the periphery of which is provided with hook-shaped vanes tangentially disposed in an opposite direction to those of the primary wheel, and a casing surrounding said secondary wheel and provided with an exhaust-opening.

13. In a steam-turbine, a hollow rotatable steam-conducting shaft communicating at one end with a stationary steam-supply member, a liquid sealing device interposed therebetween, a primary wheel carried by the opposite end of said hollow shaft and provided with internal tangentially-disposed outwardly-diverging nozzles opening out into the periphery of said wheel and communicating with said hollow shaft, a secondary wheel mounted upon a shaft and entirely inclosing said primary wheel the periphery of which is provided with hook-shaped vanes tangentially disposed in an opposite direction to those of the primary wheel, a casing surrounding said secondary wheel and provided with an exhaust-opening, a liquid seal between the wall of the secondary wheel and primary shaft, and a liquid seal between the shaft of said secondary wheel and the casing inclosing said wheel.

14. In a steam-turbine, a hollow rotatable steam-conducting shaft communicating at one end with a stationary steam-supply member, a liquid sealing device interposed therebetween, a primary wheel carried by the opposite end of said hollow shaft and provided with internal tangentially-disposed outwardly-diverging nozzles opening out into the periphery of said wheel and communicating with said hollow shaft, a secondary wheel mounted upon a shaft and entirely inclosing said primary wheel the periphery of which is provided with hook-shaped vanes tangentially disposed in an opposite direction to those of the primary wheel, and a casing surrounding said secondary wheel and provided with an exhaust-opening, in combination with a governor-controlled valve to permit steam to intermittingly pass through said stationary supply member to the primary wheel.

15. In a steam-turbine, a hollow rotatable steam-conducting shaft communicating at one end with a stationary steam-supply member, a liquid sealing device interposed therebetween, a primary wheel carried by the opposite end of said hollow shaft and provided with internal tangentially-disposed outwardly-diverging nozzles opening out into the periphery of said wheel and communicating with said hollow shaft, a secondary wheel mounted upon a shaft and entirely inclosing said primary wheel the periphery of which is provided with hook-shaped vanes tangentially disposed in an opposite direction to those of the primary wheel, a casing surrounding said secondary wheel and provided with an exhaust-opening, a liquid seal between the wall of the secondary wheel and primary shaft, and a liquid seal between the shaft of said secondary wheel and the casing inclosing said wheel, in combination with a governor-controlled valve to permit steam to intermittingly pass through said stationary supply member to the primary wheel.

16. In a steam-turbine, a hollow rotatable steam-conducting shaft communicating at one end with a stationary steam-supply member and carrying at its opposite end a primary wheel having internal outwardly-diverging nozzles opening out into the periphery thereof and communicating with said hollow shaft, a secondary wheel mounted upon the end of a shaft and entirely inclosing the primary wheel the periphery of which is provided with vanes tangentially disposed in an opposite direction to those of said primary wheel, a casing inclosing said secondary wheel and provided with an exhaust-opening, a liquid seal formed between the shaft of said primary wheel and wall of the secondary wheel, like seals between the casing and shafts of the primary and secondary wheels, and a valve-chamber provided with a valve communicating with said stationary steam-supply member, in combination with a governor to operate the valve of said chamber to intermittingly supply steam to the primary wheel.

17. In a steam-turbine, a hollow rotatable steam-conducting shaft communicating at one end with a stationary steam-supply member and carrying at its opposite end a primary wheel having internal outwardly-diverging nozzles opening out into the periphery thereof and communicating with said hollow shaft, a secondary wheel mounted on the end of a shaft and entirely inclosing the primary wheel the periphery of which is provided with vanes tangentially disposed in an opposite direction to those of said primary wheel, a casing inclosing said secondary wheel and provided with an exhaust-opening, a liquid seal formed between the shaft of said primary wheel and wall of the secondary wheel, like seals between the casing and shafts of the primary and secondary wheels, a liquid sealing device interposed between said hollow shaft and stationary steam-supply member, and a valve-chamber provided with a valve communicating with said stationary steam-supply member, in combination with a governor to operate the valve of said chamber to intermittingly supply steam to the primary wheel.

18. In a steam-turbine, a hollow rotatable steam-conducting shaft communicating at one end with a stationary steam-supply member and carrying at its opposite end a primary wheel having internal

outwardly-diverging nozzles opening out into the periphery thereof and communicating with said hollow shaft, a secondary wheel mounted upon the end of a shaft and entirely inclosing the primary wheel the periphery of which is provided with vanes tangentially disposed in an opposite direction to those of said primary wheel, a casing inclosing said secondary wheel and provided with an exhaust-opening, a liquid seal between the shaft of said primary wheel and wall of the secondary wheel, like seals between the casing and shafts of the primary and secondary wheels, a liquid sealing device interposed between said hollow shaft and stationary steam-supply member means to cause water to surround the primary-wheel shaft to cool the same, and a valve-chamber provided with a valve communicating with said stationary steam-supply member, in combination with a governor to operate the valve of said chamber to intermittingly supply steam to the primary wheel.

19. In a steam-turbine, a primary wheel receiving steam through its shaft and discharging the same through openings in its periphery, and a secondary wheel entirely inclosing the primary wheel the periphery of which is provided with vanes between which the steam passes upon issuing from the openings in the primary wheel.

20. In a steam-turbine, a primary wheel receiving steam at its axis and discharging the same from tangentially-disposed openings in its periphery, and a secondary wheel entirely inclosing said primary wheel the periphery of which is provided with vanes tangentially disposed in an opposite direction to the openings of said primary wheel.

21. In a steam-turbine, two power-generating wheels rotating in opposite directions, one receiving steam through a hollow shaft upon which it revolves and is driven by the initial energy of the steam and the other driven by the steam velocity acting upon vanes carried thereby after leaving the first-mentioned wheel, a liquid sealing device interposed between the hollow revoluble shaft of the steam pressure and expansion wheel and the fixed supply-pipe communicating therewith.

22. In a steam-turbine, two power-generating wheels rotating in opposite directions, one receiving steam through a hollow shaft upon which it revolves and is driven by the initial energy of the steam and the other driven by the steam velocity acting upon vanes carried thereby after leaving the first-mentioned wheel, a liquid sealing device interposed between the hollow revoluble shaft-pipe of the steam pressure and expansion wheel and the fixed supply-pipe communicating therewith, and a governor-controlled valve to intermittingly supply steam to said first-mentioned wheel.

23. In a steam-turbine, two power-generating wheels rotating in opposite directions, one receiving steam through a hollow shaft upon which it revolves and is driven by the initial energy of the steam and the other driven by the velocity acting upon vanes carried thereby after leaving the first-mentioned wheel, a liquid sealing device interposed between the hollow revoluble shaft of the steam pressure and expansion wheel and the fixed supply-pipe communicating therewith, and means for forming a vacuum between the said wheels and the casing inclosing the same.

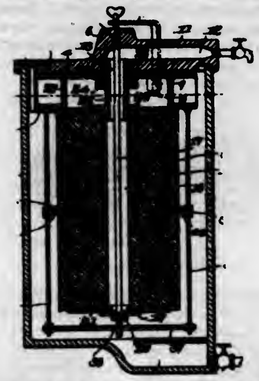
24. In a steam-turbine, two power-generating wheels rotating in opposite directions, one receiving steam through a hollow shaft upon which it revolves and is driven by the initial energy of the steam and the other driven by the steam velocity acting upon vanes carried thereby after leaving the first-mentioned wheel, a liquid sealing device interposed between the hollow revoluble shaft of the steam-expansion wheel and the fixed supply-pipe communicating therewith, and a governor-controlled valve to intermittingly supply steam to said first-mentioned wheel, and means for forming a vacuum between the said wheels and the casing inclosing the same.

25. The combination with the primary wheel, of a hollow shaft, a steam-tube inclosed thereby, and a space between said tube and shaft partly filled with liquid said liquid adapted to cling to the interior wall of the shaft by centrifugal motion and prevent heating thereof.

26. The combination with the primary wheel, of a hollow shaft, a steam-tube inclosed thereby and rotatable therewith, and a space between said tube and shaft partly filled with liquid, said liquid adapted to cling to the interior wall of the shaft by centrifugal motion and prevent heating thereof.

811,664. FILTER. LLOYD V. ROOD, Meriotta, Ohio. Filed May 10, 1905. Serial No. 259,736.

Claim.—1. A filter comprising a body having an inlet near its top, a cover having a draw-off passage communicating with a central passage piercing the bottom of the cover, a tubular filtering element hung from the cover, a tube hung from the cover and communicating between the bore of the filtering element and the central passage of the cover, a water-wheel mounted upon the tube in cooperative relation with the inlet, and cleansing means carried by the water-wheel and working in coöperation with the filtering element.



2. In a filter, the combination of a body, a cover having a draw-off passage centrally piercing the bottom of the cover, a tubular filtering element within the body, a hanger depending from the cover through the draw-off passage and the bore of the filtering element and connected to the latter, a tube depending from the cover with its lower end fitting the bore of the filtering element and its upper end in communication with the draw-off passage, the tube being provided with an external annular flange, a water-wheel having a hub rotatably embracing the tube and supported upon the flange thereof, and cleansing means carried by the water-wheel in coöperative relation with the filtering element.

3. A filter of the class described comprising a filtering element and a cleansing device mounted to rotate concentrically with respect to the filtering element and including a support working around the filtering element, a cleaning member having a crank-arm pivotally mounted upon the support, a centrifugal member pivoted upon the support independently of the arm, and a link carried by the centrifugal member and connected to the arm.

4. A filter of the class described comprising a filtering element and a cleansing device mounted to rotate concentrically with respect to the filtering element and including a support, a cleaning element having a crank-arm pivoted upon the support, a centrifugal member pivotally mounted upon the support independently of the arm, and a link rigidly carried by the centrifugal member and having a slidable connection with the arm.

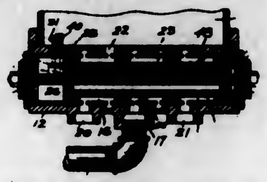
5. In a filter, the combination of a casing, a filtering element therein, a water-wheel for actuation by the incoming water, a pair of substantially parallel rods hung from the wheel, sleeves rotatably mounted upon the rods, a crank-arm carried by one of the sleeves, a cleaning element carried by the crank-arm, a centrifugal member carried by the other sleeve, and a link rigidly carried by said other sleeve and connected to the arm.

6. A filter of the class described comprising a filtering element and a cleansing device mounted to rotate concentrically with respect to the filtering element and including a support working around the filtering element, a cleaning member mounted to swing upon the support, a centrifugal member mounted to swing upon the support independently of the cleaning member, and means connecting the centrifugal member and the cleaning member.

7. In a filter of the class described, the combination of a casing, a filtering element therein, a water-wheel for actuation by the incoming water, a pair of substantially parallel rods hung from the wheel, sleeves rotatably mounted upon the rods, a crank-arm carried by one of the sleeves, a cleaning element pivotally supported intermediate of its ends upon the crank-arm in frictional engagement with the filtering element, a centrifugal member carried by the other sleeve, and a link rigidly carried by said other sleeve and connected to the arm.

811,665. FLUID-PRESSURE MOTOR. FREDERICK SAGE, Redrock, Pa., assignor, by direct and mesne assignments, of forty-five one-hundredths to himself, thirty one-hundredths to Ross B. Sage, Redrock, Pa., and twenty-five one-hundredths to Cyrus H. Sage, Johnstown, Pa. Original application filed Oct. 20, 1904, Serial No. 229,206. Divided and this application filed Dec. 5, 1904. Serial No. 236,551.

Claim.—1. In a pumping-engine, the combination of a power-cylinder, a piston therein, passages leading to the opposite ends of the cylinder, a main valve for controlling said passages, said main valve being adapted to be moved by fluid-pressure, and means for exhausting fluid-pressure alternately from opposite sides of said main valve, said means comprising valves controlling exhaust-passages, actuating means for such valves projecting into the cylinder on opposite sides of the piston, and springs on said actuating means and extending beyond the ends thereof.

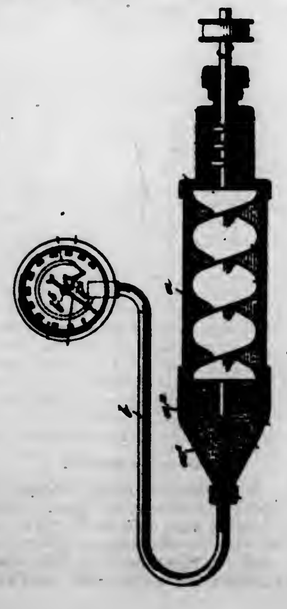


2. In a pumping-engine, the combination of a power-cylinder, a piston therein, passages leading to the opposite ends of the cylinder, a main valve for controlling said passages, said main valve being adapted to be moved by fluid-pressure, and means for exhausting fluid-pressure alternately from opposite sides of said main valve, said means comprising valves controlling exhaust-passages and provided with stems projecting into the cylinder on opposite sides of the piston, and cushioning means carried by said valve-stems.

3. A fluid-controlled valve for engines comprising a casing, a piston-valve slidably mounted therein and provided with an opening extending therethrough to both ends and having a port through its walls connecting the opening therein with a fluid-supply passage, and a guide-rod extending through the opening in the valve but only partially filling the same, whereby motive fluid may pass to the ends of said piston-valve.

4. A fluid-controlled valve for engines comprising a casing, a piston-valve slidably mounted therein and provided with an opening extending axially therethrough to both ends and having a port through its walls connecting the axial opening therein with a fluid-supply passage, a bolt extending through the axial opening of the valve but only partially filling the same, whereby motive fluid can pass to the ends of said piston-valve, and heads for said valve-casing secured in place by means of said bolt.

811,666. **SPEED-INDICATOR.** SAUL SOKULSKOFF, Philadelphia, Pa. Filed Sept. 11, 1905. Serial No. 277,813.



Claim.—1. In a speed-indicator, a cylinder adapted to receive and to confine a liquid, indicating means connected therewith and engaged by the liquid, a shaft arranged in said cylinder and extending therethrough, means arranged within said cylinder and secured to said shaft and adapted when actuated by the same to exert pressure on the liquid and by the liquid to actuate said indicating means, disks secured to said shaft, a sectional block connected with said cylinder and having chambers, the chambers of said block arranged to receive a portion of said shaft and its disks, a sleeve adapted to hold the sections of said block together, and said disks and blocks adapted to hold said pressure-exerting means in position in said cylinder and to prevent exit of the liquid from the same.

2. In a speed-indicator, a cylinder adapted to receive and to confine a liquid, indicating means connected therewith and engaged by the liquid, a shaft arranged in said cylinder and extending therethrough, a spiral screw arranged within said cylinder and secured to said shaft and adapted when actuated by the same to exert pressure on the liquid and by the liquid to actuate said indicating means, disks secured to said shaft, a sectional block connected with said cylinder having chambers arranged to receive a portion of said shaft and said disks, a sleeve having a stuffing-box adapted to hold the sections of said block together and said disks and block adapted to prevent longitudinal movement of said pressure-exerting means in said cylinder and in conjunction with said stuffing-box to prevent exit of the liquid from the same.

811,667. **FUSE FOR PROJECTILES.** HENRY C. SIMSON, West Kensington, England. Filed July 7, 1905. Serial No. 268,694.

Claim.—1. The combination of a fuse-body, a firing-pellet, means for normally preventing the pellet from moving rearward, and a spring engaging with the pellet and with the body and preventing the pellet from moving forward but not impeding its rearward movement.

2. The combination of a fuse-body, a firing-pellet, means for normally preventing the pellet from moving rearward, and a spring carried by the pellet and engaging with the body and preventing the pellet from moving forward but not impeding its rearward movement.

3. The combination of a fuse-body, a firing-pellet, means for normally preventing the pellet from moving rearward, a spring engaging with the pellet and with the body and preventing the pellet from moving forward but not impeding its rearward movement, and a ball partially projecting from a hole in the body and engaging with the pellet.

4. The combination of a fuse-body, a firing-pellet, means for normally preventing the pellet from moving rearward and a spring engaging with the pellet and with the body, the end of which when released tends to move inward but normally prevents the pellet from moving forward.

5. The combination of a fuse-body, a firing-pellet, means for normally preventing the pellet from moving rearward, a spring carried by the pellet and engaging with the body and preventing the pellet from moving forward but not impeding its rearward movement, and a ball partially projecting from a hole in the body and engaging with the pellet.

6. The combination of a fuse-body, a firing-pellet, means for normally preventing the pellet from moving rearward, a spring engaging with the pellet and with the body and preventing the pellet from moving forward but not impeding its rearward movement, a ball partially projecting from a hole in the body and engaging with the pellet, and a spring tending to force the ball radially inward out of the hole.

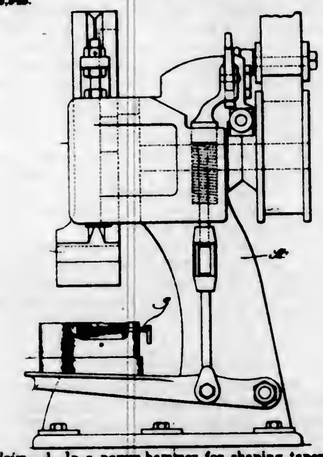
7. The combination of a fuse-body, a firing-pellet, means for normally preventing the pellet from moving rearward, a spring carried by the pellet and engaging with the body and preventing the pellet from moving forward but not impeding its rearward movement, a ball partially projecting from a hole in the body and engaging with the pellet, and a spring tending to force the ball radially inward out of the hole.

811,668. **FUSE FOR PROJECTILES.** HENRY C. SIMSON, West Kensington, England. Filed July 7, 1905. Serial No. 268,695.

Claim.—1. The combination of a firing-pellet, a radial bolt engaging with the pellet and a deformable part normally holding the bolt in position and exposed to the pressure of the gases in the gun.

2. The combination of a firing-pellet, a radial bolt engaging with the pellet, a pressure-plate abutting against the bolt and a compressible cup exposed to the pressure of the gases in the gun bearing on the plate.

811,669. **POWER-HAMMER FOR FORGING TAPERED WORK.** WILLIAM B. SWEENY, Boston, Mass. Filed July 25, 1903. Serial No. 166,943.



Claim.—1. In a power-hammer for shaping tapered work, a hammer and an anvil comprising a block having a recess and a member resting on and in sliding engagement with the bottom of the recess and normally free to rock about a single axis parallel to the face of the hammer, said member having its center of gravity below its axis and thereby being maintained in any adjusted position in the recess.

2. An anvil for power-hammers comprising a block, and a member supported thereby and normally free to rock about an axis parallel to the face of the hammer, said member having a substantially flat work-receiving face, one edge of which is rounded.

3. An anvil for a power-hammer, comprising a block having a parti-cylindrical recess, a rocking-anvil die received in said recess, said die having a work-receiving face and a cylindrical bottom to rest and slide upon the bottom of the recess as the die is rocked about an axis substantially in the plane of the work-receiving face.

4. An anvil for a power-hammer, comprising a block having a cylindrical recess, a substantially semicylindrical rocking-anvil die sustained in said recess, the sides of the recess embracing the sides of the die whereby the die has in any position a firm seat on the bottom of the recess.

5. An anvil for a power-hammer, having a work-receiving face which is free to rock about an axis located substantially in said face.

6. An anvil for a power-hammer, comprising a rocking-anvil die provided with a work-receiving face, one portion of which is flat, and the other portion of which has a rounded edge.

7. In a power-hammer, a reciprocating hammer and a two-part anvil, one of said parts of the anvil having a freely-movable face and the other a fixed face, both of said faces being situated beneath the hammer.

8. In a power-hammer for shaping tapered work, a reciprocating hammer, a fixed anvil-block having a portion constituting a fixed anvil-face, and a freely-rocking auxiliary-anvil die supported by said block, said auxiliary anvil and the fixed face of the anvil-block both being situated beneath the hammer.

9. An anvil-die, a block recessed to sustain said die, said die being normally free to tip under the action of the work, and means to eject scale from said recess by the rocking movement of the die.

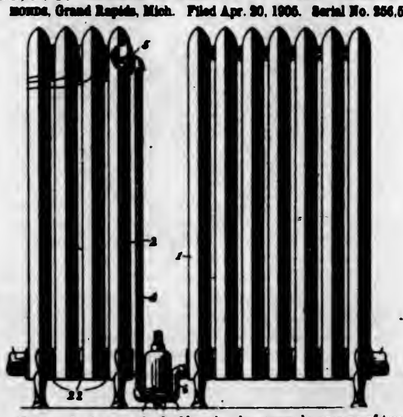
10. An anvil-die having a projection at its convexed under side, and a block recessed to sustain said anvil-die loosely, said block having a pit and passages for the escape of scale.

11. In an anvil for a power-hammer, a block, and an anvil-die supported thereby to rock about an axis parallel to the hammer-face, the center of gravity of said die being below its axis.

12. An anvil for a power-hammer, comprising a block having a parti-cylindrical recess and a parti-cylindrical anvil-die received in said recess and capable of turning therein about an axis situated substantially in the face thereof.

13. In an anvil for a power-hammer, comprising an anvil-die, a block recessed to sustain said die that it may be tipped about an axis substantially in the face thereof.

811,670. **METHOD OF HEATING BY STEAM.** FRANK A. SIMMONDS, Grand Rapids, Mich. Filed Apr. 20, 1905. Serial No. 256,516.



Claim.—1. In a method of heating by steam by means of two or more radiators connected in series and in which different temperatures and pressures are maintained, the improved method of revaporating the water consisting substantially of conducting the condensed water from the bottom of the high-pressure radiator and discharging the same into the lower-pressure radiator at a point above the bottom of the same.

2. In a method of heating by steam, substantially as herein described, the improved method of revaporating the condensed water by taking the same from the bottom of the high-pressure radiator and discharging said water into the top of the low-pressure radiator.

3. In a method of heating by steam by means of radiators connected in series, and in which different pressures and temperatures are maintained, the improved method of revaporating the condensed water consisting in discharging the same into the low-pressure radiator in a spray and above the bottom of the same.

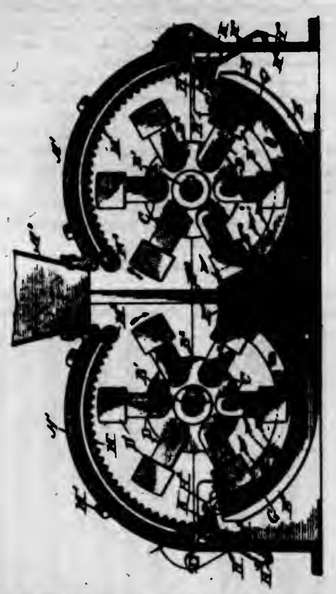
4. The improved method of heating by steam comprising admitting the steam to a radiator under a certain pressure and abstracting heat therefrom until the steam is condensed to water, passing the water to a second radiator in which a materially less pressure is maintained and discharging the water into said radiator near the top thereof and opposite a horizontal passage therein.

811,671. **CRUSHER.** PETER L. SIMPSON, Chicago, Ill., assignor to Herbert S. Simpson, Chicago, Ill. Filed Feb. 20, 1903. Serial No. 94,056.

Claim.—1. In a crusher, the combination with hammers, and means for rotating them about adjacent centers so as to crush material between them, of means for inserting material between said hammers so that it will be crushed, a dividing-block located beneath the points of nearest approach of hammers to each other, and grate-bars extending in curves from said block and underneath the axes of said hammers.

2. In a crusher, the combination with a casing, a pair of parallel shafts rotated in opposite directions, and pivoted hammers carried

by said shafts, of means by which material may be inserted between the hammers on opposite shafts, a block located beneath the point at which material is crushed between said hammers, and grate-bars extending from said block in concaves under said shafts.



3. The combination with a casing provided with two cylindrical chambers communicating with each other, a rotating shaft located at the axis of each chamber, pivoted hammers supported on each shaft and moved thereby toward the hammers on the opposite shaft, and means by which material to be crushed may be inserted between the hammers on opposite shafts, of a dividing-block located at the junction of the two chambers and closely adjacent to said hammers, and grate-bars extending from said block in opposite directions so as to form the lower concave portion of each chamber.

4. In a crusher, the combination with a casing, a pair of parallel shafts rotated in opposite directions, and pivoted hammers carried by said shafts, of a block located beneath the point at which material is crushed between the hammers of opposite shafts, grate-bars extending in opposite directions from said block and forming concave surfaces under said shafts, and corrugated plates forming concave surfaces over said shafts.

5. The combination with a casing, a pair of parallel shafts, and pivoted hammers carried by said shafts, of a dividing-block located between and slightly below said shafts, concave grate-surfaces extending from said dividing-block underneath each shaft, and corrugated concave surfaces extending over said shafts.

6. The combination with a casing, a pair of parallel shafts, and pivoted hammers carried by said shafts, said casing having an opening located between and slightly above said shafts, of a dividing-block located between and slightly below said shafts, concave grate-surfaces extending in opposite directions from said block under said shafts, and concave corrugated surfaces extending in a similar manner from said opening over said shafts.

7. In a crusher, a casing consisting of two parts bolted and providing two cylindrical chambers communicating with each other, rotary hammers supported at the axes of said chambers, and liners adapted to be inserted between the parts of the casing whereby the distance between the axes of said chambers may be adjusted to and from each other.

8. In a crusher having two sets of hammers carried by corresponding shafts, a casing inclosing said hammers and providing bearings for said shafts, said casing being divided into two parts at some point between the two shafts, and means whereby the parts of said casing may be adjusted to and from each other so that the hammers on one shaft may be adjusted with respect to the hammers on the other shaft.

9. A rotating shaft, disks carried by said shaft, eccentrics carried by said disks, hammers pivoted upon said eccentrics, and means for adjusting said eccentrics so as to vary the distance of said hammers from the center of said shaft.

10. A series of cylindrical blocks united by an eccentrically-placed rod, bearings for said blocks, hammers supported on said rod between said blocks, and means for securing said blocks at different positions in their bearings.

11. The combination with an eccentric and a bearing therefor, said eccentric being provided with a hole for the reception of a pin and said bearing being provided with a series of similar holes adjacent to said eccentric, of washers provided with two pins one of which is adapted to be inserted in the hole in said eccentric and the other of which is adapted to be inserted in one of the holes in said bearing.

12. A series of grate-bars, a clamping-block for holding said bars to their seat, and an equalizing-lever adapted to simultaneously press said bars together and to operate said clamping-block.

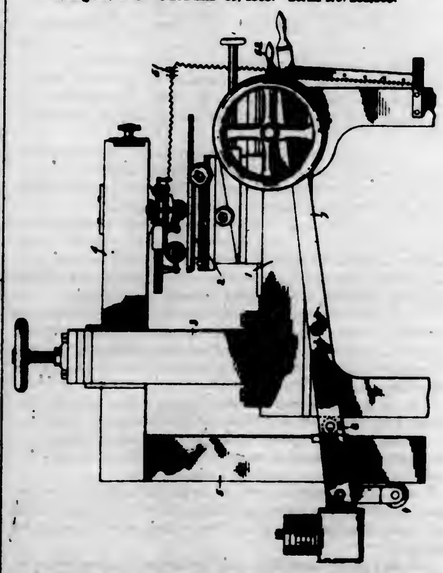
13. In a crusher, a casing, revolving hammers supported within said casing, a series of grate-bars supported beneath said hammers and arranged concentrically therewith, an eccentrically-placed corrugated liner secured to the inside surface of the casing over said hammers, said liner being provided with an interior chamber, and means for admitting steam to said chamber.

14. A frame providing two interior and communicating chambers having axes parallel to each other, a series of bars forming part of the boundary of each chamber and arranged to be at a uniform distance from their respective axes, a corrugated liner forming the boundary of another part of each chamber, said liners being provided with interior steam-chambers and being so located that different parts lie at different distances from their respective axes, and means for admitting steam to the interior of said liners.

15. The combination with a rotating shaft, crushing devices carried thereby, and a grate-surface beneath said devices arranged to permit crushed material to fall therethrough, of a corrugated crushing-surface disposed eccentrically over said crushing devices, means for heating said corrugated surface.

16. The combination with a rotating shaft, crushing devices carried thereby, a grate-surface beneath said devices, and a casing inclosing said devices and grate-surface, of a corrugated plate secured to the inner surface of said casing over said crushing devices and eccentrically disposed with respect thereto, and means for heating said corrugated plate.

811,672. TRANSFER-PRESS AND ATTACHMENTS THEREFOR. BURGESS SMITH, Washington, D. C., assignor to John R. Hill, Washington, D. C. Filed Mar. 13, 1905. Serial No. 249,865.



Claim.—1. In a transfer-press, the combination of a transfer-roll, an index member carried thereby and provided with notches, and a latch carried by the press in operative relation to said notches, substantially as described.

2. In a transfer-press, the combination of a transfer-roll, an index member carried thereby and provided with notches, and an automatically-operated latch carried by the press in operative relation to said notches, substantially as described.

3. In a transfer-press, the combination of a transfer-roll, an index member carried thereby and provided with index characters and notches, and a latch carried by the press in operative relation to said notches, substantially as described.

4. As an article of manufacture, a transfer-roll comprising an arbor, a roll secured thereon and provided with the usual peripheral characters, an index member provided with characters corresponding to those on said roll, and means for securing said index member on the roll-arbor with a predetermined relation between the corresponding characters on said roll and index member, substantially as described.

5. As an article of manufacture, a transfer-roll comprising an arbor, a roll secured thereon and provided with the usual peripheral characters, an index member provided with characters corresponding in kind and relative arrangement to those on the roll, and means for securing said index member on the roll-arbor with a predetermined relation between the several corresponding characters on said roll and index member, substantially as described.

6. In a transfer-press provided with a beam, the combination of a head adjustably supported on said beam, bearers carried by said head, said bearers constructed with operating-faces substantially parallel with the surface of the work and with inclined surfaces leading to said operating-faces, substantially as described.

7. In a transfer-press, the combination of a multiple-roll support, a plurality of transfer-rolls carried thereby, and means for adjusting said support to bring any desired one of said rolls into operative position, substantially as described.

8. In a transfer-press provided with a beam, the combination of a head adjustably supported on said beam, bearers carried by said head, a multiple-roll support adjustably mounted on said head, a plurality of transfer-rolls carried by said support, and means for adjusting said support to position any desired one of the rolls in coöperative relation to said bearers, substantially as described.

9. In a transfer-press, the combination of a multiple-roll support, a plurality of transfer-rolls carried thereby, means for adjusting said support to bring any desired one of said rolls into operative position, and means for locking said support in its several adjusted positions, substantially as described.

10. In a transfer-press provided with a beam, the combination of a head adjustably supported on said beam, bearers carried by said head, a multiple-roll support adjustably mounted on said head, a plurality of transfer-rolls carried by said support, means for adjusting said support to position any desired one of the rolls in coöperative relation to said bearers, and means for locking said support in its several adjusted positions, substantially as described.

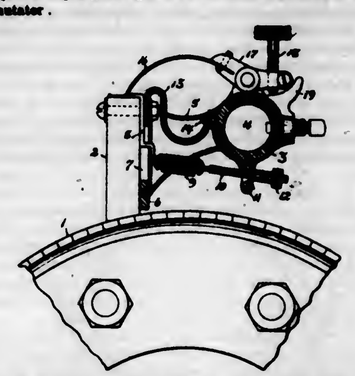
11. In a transfer-press provided with a beam, the combination of a head adjustably supported on said beam, bearers carried by said head, a multiple-roll support adjustably mounted on said head, a plurality of transfer-rolls carried by said support, means for adjusting said support to position any desired one of the rolls in coöperative relation to said bearers, means for locking said support in its several adjusted positions, and means for automatically releasing said locking means upon depression of said roll-support, substantially as described.

12. In a transfer-press provided with a beam, the combination of a head adjustably supported on said beam, bearers carried by said head, a multiple-roll support adjustably mounted on said head, means for adjusting said support to position any desired one of the rolls in coöperative relation to said bearers, and means for locking the roll so positioned with any desired one of its characters in operative position, substantially as described.

811,673. ELECTRICAL BRUSH-HOLDER. MOWAT ST. CLAIR, Fort Wayne, Ind. Filed Mar. 27, 1905. Serial No. 252,155.

Claim.—1. In a commutator-brush holder, a supporting-casting having in connection therewith a rest; a guide-slot in said rest; a contact-plate in connection with a brush, the former ranging in said slot, and the latter seated upon said rest; a retracting-spring having connection with said casting, and also with said contact-plate, and acting to hold the brush against said rest; and an adjustable spring acting against the top of the brush to hold the same in contact with the commutator.

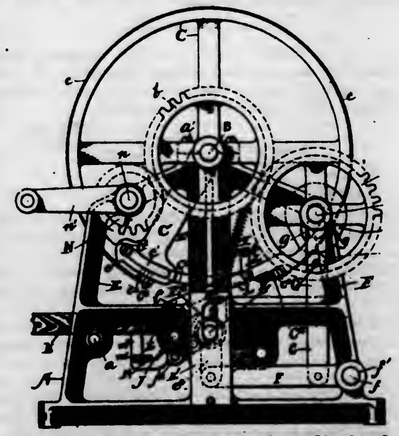
2. In a commutator-brush holder, a supporting-casting having in connection therewith a rest; a commutator-brush; a contact-plate in fixed relation with the brush; tension means in connection with the casting and contact-plate to hold the brush against the rest; and an adjustable spring acting to hold the brush into contact with the commutator.



3. In a commutator-brush holder, a supporting-casting having a rest with a guide-slot therein; a commutator-brush seated against the rest and having means in connection therewith which extends into said slot to guide the brush; and two adjustable springs, one acting to hold the brush on said rest and the other to press the brush into contact with the commutator.

4. In a commutator-brush holder, a supporting-casting having in connection therewith an adjustable commutator-brush; a rocking lever pivoted on said casting, one end of the lever having means in connection with the brush to act against the latter to hold it into contact with the commutator, the opposite end of the lever having an adjusting-screw; and an upwardly-curved lug, in connection with the casting, affording a rest for the end of said adjusting-screw.

811,674. DUPLICATING-MACHINE. CLARENCE B. STEBBINS, Maywood, Ill., assignor to A. B. Dick Company, a Corporation of Illinois. Filed Jan. 19, 1905. Serial No. 241,848.



Claim.—1. In a duplicating-machine, the combination of a stencil-carrying cylinder, means for operating said cylinder, arms pivoted to the cylinder, a feeding cross-bar connecting the ends of the arms, springs connected with the arms for outwardly projecting the feeding cross-bar, and a feeding-table adapted to have sheets of paper moved thereover to be contacted by the feeding cross-bar under tension of the springs and advanced into printing position, substantially as described.

2. In a duplicating-machine, the combination of a stencil-carrying cylinder, means for operating said cylinder, arms pivoted to the cylinder, a feeding cross-bar connecting the ends of the arms,

springs connected with the arms for outwardly projecting the feeding cross-bar, a feeding-table adapted to have sheets of paper moved thereover to be contacted by the feeding cross-bar under tension of the springs and advanced into printing position, and an abutment adapted to be contacted by the feeding mechanism after the paper has been carried into printing position, substantially as described.

3. In a duplicating-machine, the combination of a stencil-carrying cylinder, a feed-table in suitable proximity thereto, a feeding-bar connected with the stencil-carrying cylinder and held in parallel relation thereto, springs for normally outwardly projecting the feeding-bar, stops adapted to be raised above the plane of the feeding-table in one position and to be lowered at a suitable time to allow the feeding-bar to strike a sheet of paper on the feeding-table and carry the same over the stops and into printing position, substantially as described.

4. In a duplicating-machine, the combination of a stencil-carrying cylinder, a roller slidably mounted in suitable proximity thereto, a link connected with the roller, an arm connected with the link, a cam, a connection between the arm and the cam for actuating the arm, a longitudinally-extending shaft, stops mounted thereon, a printing-table in suitable proximity to the stops, and a connection between the shaft and the link for operating the roller and stops simultaneously, substantially as described.

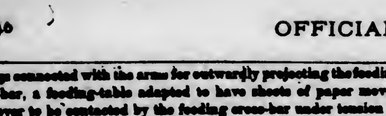
5. In a duplicating-machine, the combination with a stencil-carrying cylinder, and means for operating it, of a stop against which paper is fed by hand, means for removing said stop so that the paper may be advanced from the hand-fed position to a printing position, and an arm carried by said cylinder and arranged to so advance the paper.

6. In a duplicating-machine, the combination with a printing-cylinder, and a stencil carried thereby, of devices furnishing a stopping-point to which paper is fed by hand, automatically-operating devices for moving the paper from the hand-fed position to a second stopping-point, and means for moving the paper from the second stopping-point to engagement with the cylinder.

7. In a machine of the class described, primary and secondary stopping-points to which paper is fed prior to the beginning of the printing operation, means by which the paper may be fed by hand to the primary stopping-point, and mechanically-operating means by which the paper is fed from the primary to the secondary stopping-point.

8. The combination with a printing-cylinder, and means for operating it, of a roller movable to and from said cylinder, and stops actuated by the movement of said roller and arranged to limit the hand-feeding of paper to the cylinder.

811,675. CEMENT-FENCE-POST MOLD. GEORGE H. TRIBY, Ludington, Mich., assignor, by direct and mesne assignments, to The Economy Cement Post Machine Company, Ludington, Mich., a Corporation of Michigan. Filed Mar. 16, 1905. Serial No. 250,263.



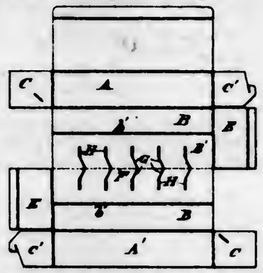
Claim.—1. A cement-fence-post mold, comprising the opposed flaring sides, each of said sides having marginal strengthening-flanges, and a longitudinally-extending strengthening-bead interposed between said flanges and the clamping-yokes adapted to embrace the sides and to bear upon said strengthening-flanges and said bead.

2. A mold for cement fence-posts, comprising the opposed tapering sides arranged to diverge and having strengthening-flanges, the end gates movably located between said divergent sides, a plurality of clamping-yokes of various sizes adapted to embrace said sides between their ends, and to slide into binding relation therewith.

3. A mold for cement fence-posts comprising the converging metallic sides, having strengthening-flanges at their margins, and a longitudinally-extending strengthening-bead interposed between said flanges, movable end gates located between said sides, clamping-yokes adapted to embrace the sides and to bear against the flanges and beads, there being upon said yokes a supporting cross-bar adapted to rest upon the upper flanges of the sides.

811,676. BOX. FREDERICK R. VINSON, Prospect, N. Y. Filed Aug. 28, 1903. Serial No. 171,669.

Claim.—1. A folding box comprising a bottom formed from a portion of the blank lying between the side walls of the box, side walls foldably connected with the bottom, flaps foldably connected with the ends of the side walls and adapted to be interlocked to form the ends of the box, a partition integral with the bottom and formed by a double fold from a part of the blank between the side walls, and division-pieces connected with the partition to form nests or compartments in the box.



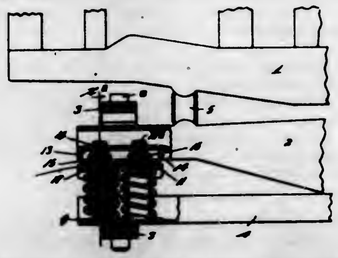
2. A folding box consisting of a bottom having upwardly-foldable parts adapted to form a double partition, division-pieces connected to said upwardly-foldable parts, side walls foldably connected with the bottom, flaps foldably connected with the ends of the side walls and adapted to interlock to constitute the ends of the box, the whole being adapted to lie flat and also adapted upon the act of interlocking the flaps to cause the double partition to assume its position to form the partition for the set-up box, substantially as described.

3. A folding box comprising a bottom having upwardly-foldable parts adapted to form a double partition, division-pieces connected to said double partition, side walls foldably connected with the said bottom, flaps foldably connected with the ends of the side walls and adapted to interlock to constitute the ends of the box, whereby the act of interlocking said flaps causes the bottom to be upwardly folded to form a partition for the set-up box, substantially as described.

4. A folding box having a principal partition integral with the bottom of the box and formed by a double fold taken from that portion of the blank which lies between the part which forms the bottom of the box, and division-pieces connected to said principal partition, all of the parts being adapted to be folded flat and the principal partition being adapted to be placed in position by the operation of setting up the box.

5. A knockdown box formed from a single blank adapted to be set up by folding on predetermined lines, that part of the blank between the part forming the side walls being divided into sections, two of the sections being adapted to be folded together to form the main partition in the box and to be placed in position by the operation of setting up the box, the remaining sections forming the bottom of the box, and division-pieces connected to the main partition.

811,677. LATERAL-MOTION DEVICE FOR CAR-TRUCKS. ROWE C. WASHBURN, Minneapolis, Minn. Filed Mar. 26, 1903. Serial No. 251,946.

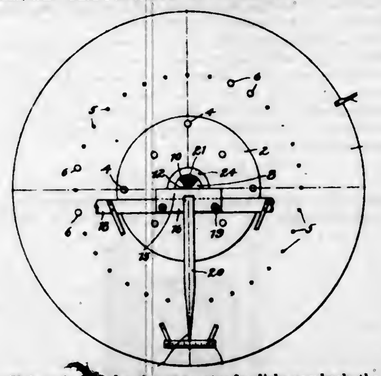


Claim.—1. The combination with a car-truck and a car-bolster, said bolster having flat bearing-surfaces, of bearing members underlying the flat surfaces of said bolster, secured against lateral movements with respect to the truck side frames and provided with flat bearing-surfaces, and flattened elliptical bearing-rollers interposed between said flat bearing-surfaces and having toothed engagement with both thereof, at points inward of the extremities of said rollers, whereby the engagement between said rollers and said flattened bearing-surfaces is continued outward of said toothed engagement, substantially as described.

2. The combination with a car-truck and a truck-bolster, said bolster having flat bearing-surfaces, of springs supported by the frame of said truck, beneath the flat surfaces of said bolster, combined spring-caps and roller-bases resting on said springs and provided with flat bearing-surfaces, and flattened rollers interposed between said flat bearing-surfaces and having toothed engagement with both thereof, substantially as described.

3. In a car-truck, the combination with trussed side frames having bolster-columns, of a spring-supported bearing-plate guided for vertical movements by said bolster-columns and provided with seats 17, a truck-bolster having the flat bearing-surfaces 13, formed with seats 16, and depending flanges 14, and elliptical rollers 15 interposed between said bearing-plate 11 and the bearing-surfaces 13 of said bolster, and provided with teeth 15', engaging said seats 16 and 17, substantially as described.

811,678. BALANCING DEVICE. WILLIAM L. WAYNE, Milwaukee, Wis. Filed Dec. 6, 1904. Serial No. 235,457.



Claim.—1. In balancing apparatus for disks or wheels, the combination of a spindle upon which the disk or wheel to be balanced is mounted, there being V-shaped extensions from said spindle provided with knife-edges, supports for said spindle engaged by said knife-edges, a needle extending from one of said extensions, and an indicating-scale for said needle.

2. In balancing apparatus for balancing wheels or disks, the combination of a spindle upon which the wheel or disk to be balanced is mounted, said spindle being provided at its end with pivoting knife-edges, supports for said spindle engaged by said pivot edges, an indicating-needle extending from said spindle, and an indicating-scale for said needle.

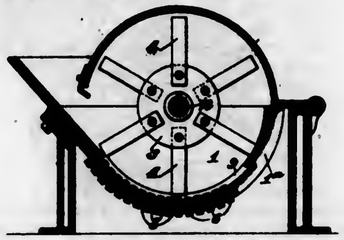
3. In balancing apparatus for balancing wheels or disks, the combination of a spindle upon which the wheel or disk to be balanced is mounted, there being extensions from said spindle provided with knife-edges coincident with the axis of the spindle, supports for said spindle engaged by said knife-edges, an indicating-needle extending from one of said extensions, and a scale for said indicating-needle.

4. In a balancing device for balancing wheels or disks, the combination of a spindle upon which the disk or wheel to be pivoted is mounted, there being extensions from the ends of said spindle having knife-edges coincident with the axis of the spindle, bearings engaged by said knife-edges, balancing-ways upon which said bearings are mounted, an indicating-needle extending from one of said extensions, and an indicating-scale for said needle.

5. In a balancing device for balancing wheels or disks, the combination of a spindle upon which the wheel or disk to be balanced is mounted, there being extensions from the ends of said spindle disposed above the axis thereof, having knife-edges disposed coincident with the axis of the spindle, bearings engaged by said knife-edges, parallel balancing-ways separably engaged by said bearings, an indicating-needle secured to one of said extensions and extending downwardly therefrom with its center line extending perpendicularly through the axis of the spindle, and an indicating-scale for said needle.

6. In a balancing device for balancing wheels or disks, the combination of a spindle upon which the wheel or disk to be balanced is mounted, there being extensions from the ends of said spindle disposed above the axis thereof, said extensions having knife-edges at the lower end thereof disposed coincident with the axis of the spindle, steel bearing-plates engaged by said knife-edges, parallel supporting-ways upon which said bearings are movably mounted, an indicating-needle secured to one of the extensions and extending downwardly therefrom with its center line passing through the axis of the spindle, and an indicating-scale for said needle, the weight of the needle below the axis of the spindle being such as to balance the weight of the extensions above the axis of the spindle.

811,679. CAGE FOR CRUSHERS AND PULVERIZERS. MILTON F. WILLIAMS, St. Louis, Mo., assignor to Williams Patent Crusher & Pulverizer Company, St. Louis, Mo., a Corporation of Missouri. Filed Jan. 14, 1905. Serial No. 241,101.



Claim.—1. The combination with a support having a curved groove, of cage-bars having reduced ends projecting into said groove whereby shoulders are provided on the cage-bars adjacent said grooves, a ring-mount coöperating with said shoulders, and means independent of said ring-mount for holding the cage-bars spaced apart; substantially as described.

2. The combination with a support having a curved groove, of cage-bars having reduced ends projecting into said groove whereby shoulders are provided on the cage-bars adjacent said grooves, an inner-ring mount coöperating with said shoulders, and means independent of said ring-mount for holding the cage-bars spaced apart; substantially as described.

3. The combination with a support having a curved groove, of cage-bars having reduced ends projecting into said groove whereby shoulders are provided on the cage-bars adjacent said grooves, an outer-ring mount coöperating with said shoulders, and means independent of said ring-mount for holding the cage-bars spaced apart; substantially as described.

4. The combination with a support having a curved groove, of cage-bars having reduced ends projecting into said groove whereby shoulders are provided on the cage-bars adjacent said grooves, inner and outer ring mounts coöperating with said shoulders, and means independent of said rings for holding the bars spaced apart; substantially as described.

5. The combination with a support having a curved groove, of cage-bars which extend into said groove, a ring-mount coöperating with said cage-bars, and fastening devices projecting through the ends of said cage-bars to secure a plurality of them together so as to form cage units; substantially as described.

6. The combination with a support having a curved groove, of cage-bars which extend into said groove, and means separate from the cage-bars and adapted to be inserted in said groove for changing the radial distances of said cage-bars from the center of the support; substantially as described.

811,680. CONTROLLER FOR SPARKING DEVICES OF GAS-ENGINES. DANIEL B. WILLEY, Alexandria Bay, N. Y., assignor of one-half to George W. Willey, Alexandria Bay, N. Y. Filed Apr. 24, 1905. Serial No. 257,268.

Claim.—1. In a gas-engine or the like, means for controlling the current to the igniters, comprising a set of contact-terminals for each igniter, each set consisting of a contact-terminal connected in a primary circuit of an induction-coil, and contact-terminals connected in the secondary circuit of the coil and to the igniter, all of said contacts being arranged in a single row, and means operating with the main shaft of the engine to close said contacts.

2. In a gas-engine or the like, means for controlling the current to an igniter, comprising a source of electricity, and an induction-coil in primary circuit therewith, the circuit having contacts, a secondary

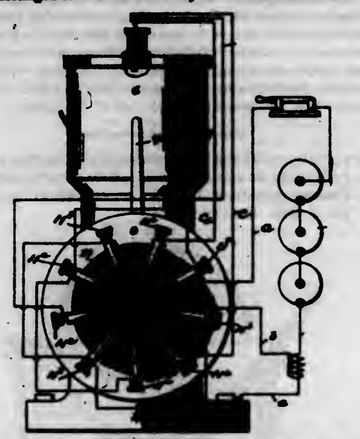
circuit connected to the igniter and having contacts, and means actuated by the engine to close said contacts, comprising a series of brushes arranged to brush successively over all of said contacts.

4. A dado-cutter comprising a hub made in telescopic sections which are internally and externally threaded, whereby to screw together, three wheels mounted on the sections, one of the wheels held

Claim.—1. In a dredge, the combination with a swinging frame carrying an endless excavator, of a counterbalancing-weight, a

811,684.

circuit connected to the igniter and having contacts, and means actuated by the engine to close said contacts, comprising a series of brushes arranged to brush successively over all of said contacts.



3. In a gas-engine or the like, means for controlling the current to a plurality of igniters, comprising a source of electricity, an induction-coil in primary circuit therewith, the circuit having contacts, a secondary circuit having contacts corresponding in number to the igniters and separate connections therefrom to the igniters respectively, all of said contacts being arranged in a single row, and means actuated by the engine to successively close said contacts.

4. In a gas-engine or the like, means for controlling the current to the igniters, comprising, in combination, a plurality of sets of brushes arranged in a single row around a shaft of the engine, the sets corresponding in number to the igniters, each set having a brush in the primary circuit of an induction-coil and a pair of brushes in the secondary circuit, and contacts carried by the shaft and revolving under said brushes and adapted to close the respective circuits.

5. In a gas-engine or the like, means for controlling the current to the igniters, comprising, in combination, a single shiftable ring extending around a shaft of the engine; a series of sets of brushes arranged in a single row—one set for each igniter—carried by the ring, each set having a brush in the primary circuit of an induction-coil, and a pair of brushes in a secondary circuit of the coil connected to an igniter; and contacts carried by the shaft and revolving therewith across the brushes, one of said contacts being a terminal in the primary circuit and the other being a connector to connect said pair of brushes.

811,681. DADO-CUTTER. RUEL WEIMAR, Los Angeles, Cal. Filed Aug. 16, 1904. Serial No. 220,575.

Claim.—1. A dado-cutter comprising a hub made in telescopic sections, wheels mounted on the sections, and means for adjusting the wheels with respect to each other on the sections.

2. A dado-cutter comprising a hub made in telescopic sections, and three wheels mounted on the sections, one of the wheels held by and between the sections.

3. A dado-cutter comprising a hub made in telescopic sections, three wheels mounted on the sections, one of the wheels held by and between the sections, and the other two wheels adjustable with respect to each other on the sections.

4. A dado-cutter comprising a hub made in telescopic sections which are internally and externally threaded, whereby to screw together, three wheels mounted on the sections, one of the wheels held by and between the sections.

5. A dado-cutter comprising a hub made in telescopic sections which are internally and externally threaded, whereby to screw together, three wheels mounted on the sections, one of the wheels held by and between the sections, and means for adjusting the other two wheels with respect to each other on the sections.

6. A dado-cutter comprising a hub composed of two sections adapted to partly telescope one another, a cutting-wheel adapted to be held between the two sections, cutting-wheels mounted on the sections, and cutting-teeth formed on the peripheries of the cutting-wheels, said cutting-wheel disposed between the cutting-wheels and being revoluble on the cutter-carrying hub.

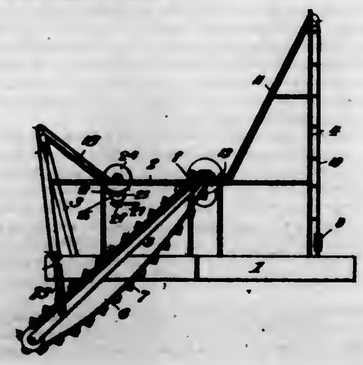
7. The herein-described dado-cutter comprising the hub A composed of the members A′ and A″ adapted to partly telescope one over the other and hold a cutting-wheel therebetween, the cutting-wheels D and E screw-threaded on their interior having on their periphery cutting-teeth D′ and E′ respectively and the cutter-carrying wheel B disposed between the cutting-wheels D and E and being revoluble on the cutter-carrying hub, and the saw-teeth cutter F removably secured on the outer side of the cutter-teeth D′.

8. In a dado-cutter of the character herein described a cutting-wheel-carrying hub A composed of the members A′ and A″ the member A′ having on one end thereof a threaded offset adapted for screw-threaded engagement in the screw-threaded socket in the member A″, the member A′ of a central cutting-wheel having also a shoulder for the reception of the central cutting-wheel substantially as herein shown and described.

811,682. CUTTER-HEAD FOR WOOD-SHAPERS. RUEL WEIMAR, Los Angeles, Cal. Filed Dec. 19, 1904. Serial No. 237,574.

Claim.—A cutter-head for wood-shapers comprising a cylinder counterbored through the center and having a slot on each side of the bore parallel therewith and extending entirely through the head, cutters inserted in said slots, the cylinder recessed on opposite sides leaving diagonally-disposed faces and integral screw-threaded lugs, adjustable cutter-knife clamps recessed on their inner sides and wedge-shaped exteriorly and provided with elongated slots 14, and screws extending through said slots into the screw-threaded holes in the lugs for forcing the clamps against the cutter-knives.

811,688. DREDGE. FRANK YEOMAN, Oroville, Cal. Filed Aug. 17, 1905. Serial No. 274,570.



Claim.—1. In a dredge, the combination with a swinging frame carrying an endless excavator, of a counterbalancing-weight, a drum, flexible connections between said weight, said frame and said drum, and a variable-speed driving means for said drum.

2. In a dredge, the combination with a swinging frame carrying a chain of excavating-buckets, of vertical guides, counterbalanced weights slidable in said guides, a winding-drum, cables attached to the free end of said frame and wound upon said drum, and cables attached to said weights and wound upon said drum in a direction opposite to that of the first-mentioned cables, substantially as described.

3. In a dredge, the combination with a swinging frame carrying an endless excavator, of a counterbalancing-weight, a drum, flexible connections between said weight, said frame and said drum, a power-shaft, driving connections between the latter and said drum, and variable-speed friction-drive gearing between said power-shaft and said driving connections, substantially as described.

4. In a dredge, the combination with a swinging frame carrying an endless excavator, of a counterbalancing-weight, a drum, flexible connections between said weight, said frame and said drum, a power-shaft, gearing between said power-shaft and the shaft of said drum, said gearing comprising a longitudinal shaft, a counter-shaft geared to said power-shaft, a friction-disk upon said longitudinal shaft, a shaft extending radially with respect to said longitudinal shaft, a friction-wheel slidable upon but free to rotate with the last-mentioned shaft and adapted to engage said friction-disk, and a driving connection between said counter-shaft and said radially-disposed shaft, substantially as described.

5. In a dredge, the combination with a swinging frame carrying an endless excavator, of a drum, a cable wound upon said drum and attached to said frame, a power-shaft, drive-gearing between said power-shaft and the shaft of said drum and comprising a longitudinal shaft, a counter-shaft geared to said power-shaft, a friction-disk upon said longitudinal shaft, a shaft disposed radially with respect to said longitudinal shaft, a friction-wheel mounted to slide upon but keyed to rotate with said radially-disposed shaft, and a driving connection between the latter and said counter-shaft, substantially as described.

6. In a dredge, the combination with a floating body carrying a vertically-swinging endless excavator, of guide devices adjacent to the corners of said body, a series of winding-drums, and a series of cables or the like engaged with said guide and each having one of its ends wound upon one of said drums and its other end adapted for attachment to a stationary object whereby said floating body may be moved laterally.

7. In a dredge, the combination with a floating body carrying a vertically-swinging endless excavator, of guide devices adjacent to the corners of said body, winding-drums, cables wound upon said drums and engaged with said guide devices, the free ends of said cables being adapted to be secured to stationary objects, a driving mechanism for said drums, a driving mechanism for said excavator, and a variable-speed driving mechanism between the driving mechanism of said excavator and the driving mechanism of said drum, substantially as described.

8. In a dredge, the combination of a float, a vertically-swinging frame mounted therein, and an endless excavator mounted upon said frame, a series of side line drums, a driving-shaft for said drums, a power-shaft, longitudinal shafts geared to said drive and power shafts, a counter-shaft, frictional gearing between the ends of said counter-shaf tand said longitudinal shaft, and means for driving said counter-shaft, substantially as described.

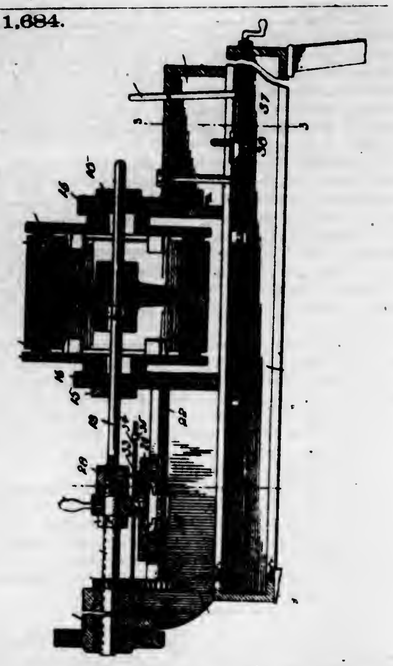
9. In a dredge, the combination of a float, a vertically-swinging frame mounted therein, and an endless excavator mounted upon said frame, a series of side line drums, a driving-shaft for said drums, a power-shaft, longitudinal shafts geared to said driving and power shafts, a counter-shaft, frictional gearing between the ends of said counter-shaft and said longitudinal shaft, means for driving said counter-shaft, a main power-shaft, a counter-shaft geared to the latter and variable-speed driving connections between the latter-mentioned counter-shaft and the first-mentioned counter-shaft substantially as described

---

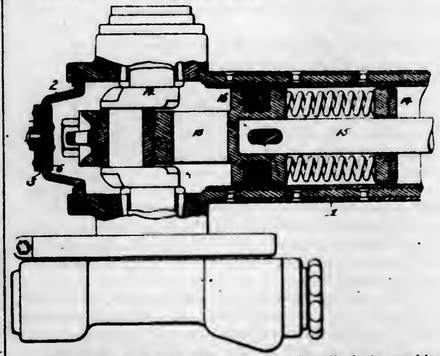
811,684. BORING-MACHINE. PHINEAS H. ADAMS and ORRINGAR T. X. ADAMS, Chicago, Ill. Filed Mar. 11, 1905. Serial No. 249,812.

Claim.—In a boring-machine, in combination, head and tail stocks having standards thereon with centered openings, bushings in said openings, a boring-bar which extends through said bushings and is guided and supported thereby on both sides of the work, and centering chuck members for the work, mounted upon the respective standards.

811,684.



811,685. ROCK-DRILL. THOMAS E. ADAMS, Cleveland, Ohio. Filed May 27, 1905. Serial No. 262,619.



Claim.—1. In a device of the character described, the combination with means for inducing an air-current, of valve mechanism for controlling the direction of said air-current to control the direction of feed of lubricant in the device.

2. In a device of the character described, the combination with means for causing an air-current to pass through the device, of valve mechanism constructed to control the direction and volume of the air-current and the direction and volume of lubricant fed through the device.

3. In a device of the character described, the combination of movable parts causing an air-current to pass through the device causing the feed of lubricant therethrough, and valve mechanism at the rear end of the device for regulating the direction of the flow and the quantity thereof.

4. In a drill, the combination of movable parts causing an air-current to pass through the drill-barrel causing the feed of lubricant therethrough to lubricate the part regardless of the inclination of the barrel, and valve mechanism in the rear end of the drill and means for adjusting said valve mechanism to regulate the direction of flow of the air-current according to the position of the drill-barrel.

5. In a drill, the combination with a barrel, and movable parts therein causing an air-current to pass therethrough, of a rotary mem-

7. In a hose-rack, the combination of a pair of side arms, a series of hose-carrying cross-pins extending between said arms, a

derailment of the train, said pipe having portions thereof disposed at

pair of driven shafts and a sprocket-wheel on each of said shafts, of

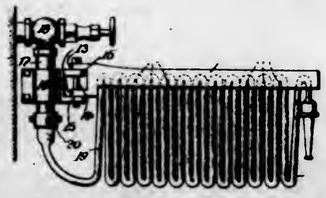
5. In a drill, the combination with a barrel, and movable parts therein causing an air-current to pass therethrough, of a rotary member on the rear end of the drill-barrel, valves carried by the rotary member, one located inside the barrel and the other outside, and said member constructed to be moved into operative position in front of air-ports in the barrel end to regulate the direction of the flow of air through the barrel to compel the feed of lubricant regardless of the inclination of the barrel.

6. In a drill, the combination with a barrel, and movable parts therein causing an air-current therethrough, of a removable back door for the drill-barrel having air-ports therein, a metal disk mounted to turn on the back door, leather disks located on opposite sides of the door, having valves located opposite to each other, and both of said disks secured to turn with the metal disk, said leather disks having cut-out portions opposite to their valves and means on the metal disk to permit the same to be turned to move either of said valves into operative position over the air-ports and govern the flow of air therethrough.

7. In a drill, the combination with a drill-barrel and movable parts therein causing an air-current therethrough, of a removable back door at the rear end of the drill-barrel having air-ports therein, a rotary disk on the back door and check-valves carried by the rotary members at opposite sides of the air-ports and said rotary members constructed to move either of said valves into operative position against the air-ports to control the direction of flow of the air-current and feed of lubricant in the barrel.

8. In a drill, the combination with a drill-barrel and movable parts therein causing an air-current therethrough to distribute lubricant throughout the same, of a removable back door at the rear end of the drill-barrel having air-ports therein, and a rotary reversible valve mechanism on said door adapted to regulate the direction of flow of the air through the air-ports, and also govern the quantity of air passing therethrough.

811,686. **HOSE-RACK.** William D. Allen and Charles F. Bowen, Chicago, Ill., assignors to W. D. Allen Manufacturing Company, Chicago, Ill., a Corporation. Filed Feb. 8, 1905. Serial No. 244,749.



Claim.—1. In a hose-rack, the combination of a series of hose-carrying cross-supports, side supports between which said cross-supports extend, one of said side supports being shiftable to release the cross-supports and drop the hose from the rack and a releasable latch for holding said shiftable side support in normal position, substantially as described.

2. The combination with a hose-rack, of a series of hose-carrying cross-supports and a supporting device common to all of said cross-supports and shiftable to simultaneously release the same to drop the hose bodily from the rack, substantially as described.

3. In a hose-rack, the combination of a series of hose-carrying cross-supports, side supports between which said cross-supports extend, one of said side supports being pivoted to swing downwardly and release the cross-supports and releasable means for normally upholding said pivoted side support, substantially as described.

4. In a hose-rack, the combination of a series of hose-carrying cross-supports, side supports between which said cross-supports extend, one of said side supports being pivoted to swing downwardly and a latch at the outer end of the rack for normally upholding said swinging side support, said latch being releasable in the act of removing the hose from the rack, substantially as described.

5. In a hose-rack, the combination of a pair of side arms, of a series of hose-carrying cross-supports extending between said side arms and releasable means on one of said side arms for sustaining the pins in position, substantially as described.

6. In a hose-rack, the combination of a pair of side arms, a series of hose-carrying cross-pins extending between said arms and a shiftable support common to all of said pins on one of said side arms for releasably sustaining the same in position, substantially as described.

7. In a hose-rack, the combination of a pair of side arms, a series of hose-carrying cross-pins extending between said arms, a swinging supporting-ledge on one of said side arms for releasably sustaining the pins and a latch for normally upholding said ledge, substantially as described.

8. In a hose-rack, the combination with a pair of side arms, of a series of hose-carrying cross-pins pivotally connected at one end to one of said arms to swing downwardly therefrom, and shiftable supporting means on the other of said arms for releasably sustaining the free ends of said pins, substantially as described.

9. In a hose-rack, the combination with a pair of side arms, of a series of hose-carrying cross-pins pivotally connected at one end to one of said arms to swing downwardly therefrom, a supporting-ledge pivotally mounted on the other of said arms for releasably sustaining the free ends of said pins and a latch for upholding said supporting-ledge, substantially as described.

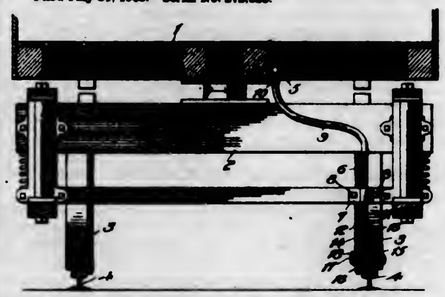
10. In a hose-rack, the combination with a pair of side arms, of a series of hose-carrying cross-pins pivotally and slidably connected at one end to one of said arms, and a support on the other of said arms with which the free ends of said pins slidably engage, said support being shiftable to release the ends of the pins and drop the hose from the rack, substantially as described.

11. In a hose-rack, the combination of a pair of side arms, one of said arms having a slot or guideway, a series of hose-carrying cross-supports having heads at one end loosely engaging said guideway to connect said pins to said arm and shiftable supporting means on the other of said arms for releasably sustaining the free ends of said cross-supports, substantially as described.

12. In a hose-rack, the combination of a pair of side arms, one of said arms having a slot or guideway, a series of hose-carrying cross-pins having heads at one end loosely engaging said slot to pivotally and slidably connect said pins to said arm, a swinging support on the other of said arms for upholding the free ends of the pins and a releasable latch for upholding said support, substantially as described.

13. In a hose-rack, the combination of a pair of side arms, one of said arms having a slot or guideway, a series of hose-carrying cross-pins having ball-heads at one end loosely engaging said slot or guideway, a supporting-ledge pivoted to the other of said arms to swing downwardly therefrom, and a latch arranged to be released in the act of removing the hose from the rack for normally holding said ledge in position to sustain the free ends of the pins, substantially as described.

811,687. **AUTOMATIC EMERGENCY AIR-BRAKE-OPERATING DEVICE FOR RAILWAYS.** John P. Birmingham, Lexington, Va., assignor to Robert Catlett and Robert Athelstan Marr, Lexington, Va.; William George Mathews, Clifton Forge, Va., and James Bailey Edmunds, Don Peters Halsey, and James William Gerow, Lynchburg, Va. Filed July 31, 1905. Serial No. 272,626.



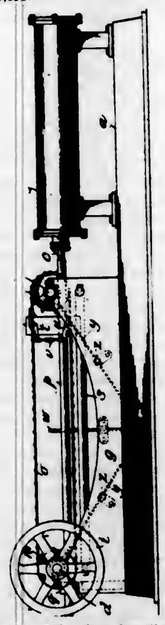
Claim.—1. In an automatic fluid-pressure brake system, the combination with the train-pipe, of a frangible pipe connected thereto and having a laterally-deflected portion terminating close to and at one side of the railway-rail, and a shoe portion extending across and close to the rail and terminating in a free end at the other side of the rail.

2. In an automatic fluid-pressure brake system, the combination of the train-pipe, a frangible pipe adapted to be broken by contact with the road-bed or track upon the derailment of the train, said pipe having portions thereof angularly disposed and presenting free angles, and a flexible pipe connecting said train and frangible pipes.

3. In an automatic fluid-pressure brake system, the combination with the train-pipe and a frangible pipe connected thereto and adapted to be broken by contact with the road-bed or track upon the derailment of the train, said pipe having portions thereof disposed at an angle to each other, one of said portions extending transversely of the track-rail and another extending longitudinally thereof, said pipe being weakened at the angles.

4. In an automatic fluid-pressure brake system, the combination of the train-pipe, and a frangible pipe connected thereto and adapted to be broken by contact with the road-bed or track upon the derailment of the train, said pipe having portions thereof disposed at angles to each other, said portions being arranged in different planes, the angles between the different angular portions of the pipe being free angles, for the purpose set forth.

811,688. **CENTERLESS ENGINE.** William H. Blodgett, Los Angeles, Cal., and William H. Miller, Boise, Idaho. Filed May 6, 1905. Serial No. 259,133.



Claim.—1. In a device of the class described, the combination with the pair of driven shafts, and a sprocket-wheel on each of said shafts, of the chain connecting said wheels, the cross-head reciprocating adjacent the chain, the pawls adapted to engage the two runs of the chain for the purpose described, and the adjustable link connecting the pawls and adapted to regulate their engagement with the chain.

2. In a device of the class described, the combination with the pair of driven shafts, and a sprocket-wheel on each of said shafts, of the chain connecting said wheels, the cross-head reciprocating adjacent the chain, the pawls adapted to engage the two runs of the chain for the purpose described, and a link engaging the head of one pawl and the tail of the other.

3. In a device of the class described, the combination with a pair of driven shafts, and a sprocket-wheel on each of said shafts, of the chain having horizontal runs connecting said wheels, the cross-head reciprocating adjacent the chain, the hook-shaped pawls having cam-surfaces on the hooks and adapted to alternately engage the two runs of the chain, and a link connecting the pawls.

4. In a device of the class described, the combination with a pair of driven shafts and a sprocket-wheel on each of said shafts, of the chain having horizontal runs connecting said wheels, the cross-head reciprocating adjacent the chain, a pawl carried by said cross-head and adapted to engage the outer side of the upper run of the chain, another pawl carried by the cross-head and adapted to engage the inner side of the other run of the chain, and a link connecting said pawls.

5. In a device of the class described, the combination with a pair of driven shafts and a sprocket-wheel on each of said shafts, of the chain connecting said wheels, the cross-head reciprocating adjacent the chain, a pawl carried by said cross-head and adapted to engage the outer side of the upper run of the chain, another pawl carried by the cross-head and adapted to engage the inner side of the other run of the chain, and a link connecting the tail of the upper pawl with the head of the lower pawl.

6. In a device of the class described, the combination with a pair of driven shafts and a sprocket-wheel on each of said shafts, of the chain connecting said wheels, the cross-head reciprocating adjacent the chain, the hook-shaped pawls adapted to alternately engage the two runs of the chain, and having the cam-surfaces formed on the hooks, and an adjustable link connecting the pawls and adapted to regulate their engagement with the chain.

7. In a device of the class described, the combination with a pair of driven shafts and a sprocket-wheel on each of said shafts, of the chain connecting said wheels, the cross-head reciprocating adjacent the chain, the hook-shaped pawl *t* having the cam-surface formed on the hook and adapted to engage the outer side of the upper run of the chain, the hook-shaped pawl *u* having the cam-surface on the hook and adapted to engage with the inner side of the other run of the chain, both of said pawls being carried by the cross-head, and an adjustable link *v* connecting the tail of the pawl *t* with the head of the pawl *u*.

8. In a device of the class described, the combination with a pair of driven shafts and a pair of sprocket-wheels on each of said shafts, of the pair of sprocket-chains connecting said wheels, the cross-head reciprocating adjacent the chains, mechanism carried by said cross-head adapted to engage the upper or lower run of one or the other of said chains, and means for determining which of said chains shall be engaged and thereby the direction of rotation of the shafts controlled.

9. In a device of the class described, the combination with a pair of driven shafts and a pair of sprocket-wheels on each of said shafts, of the pair of sprocket-chains connecting said wheels, the cross-head reciprocating adjacent the chains, mechanism carried by said cross-head adapted to engage the upper or lower run of one or the other of said chains, and means for causing relative lateral movement of the chains and cross-head to determine which of said chains shall be engaged and thereby the direction of rotation of the shafts controlled.

10. In a device of the class described, the combination with a pair of driven shafts and a pair of sprocket-wheels on each of said shafts, of the pair of sprocket-chains connecting said wheels, the cross-head reciprocating adjacent the chains, mechanism carried by said cross-head adapted to engage the upper or lower run of one or the other of said chains, and means for moving the chains laterally to determine which of them shall be engaged by the mechanism on the cross-head and thereby the direction of rotation of the shafts controlled.

11. In a device of the class described, the combination with a pair of driven shafts and a pair of sprocket-wheels on each of said shafts, of a pair of sprocket-chains connecting said wheels, the cross-head reciprocating adjacent the chains, mechanism carried by said cross-head adapted to engage the upper or lower run of one or the other of said chains, and means for moving the sprocket-wheels and chains laterally to determine which of them shall be engaged by the mechanism on the cross-head and thereby the direction of rotation of the shafts controlled.

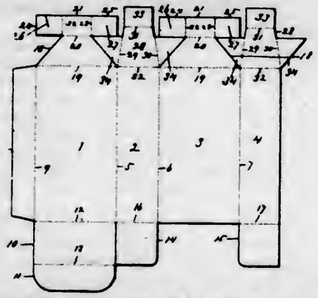
12. In a device of the class described, the combination with a pair of driven shafts each carrying a sleeve splined thereon, of a pair of sprocket-wheels secured on each of said sleeves, a pair of sprocket-chains connecting said wheels, the cross-head reciprocating adjacent the chains, mechanism carried by said cross-head adapted to engage the upper or lower run of one or the other of said chains, and means for moving the sleeves longitudinally of their shafts to determine which of said chains shall be engaged by the mechanism and thereby the direction of rotation of the shafts controlled.

13. In a device of the class described, the combination with a pair of driven shafts, each carrying a sleeve splined thereon and having the channel therein, of the pair of sprocket-wheels carried by each of said sleeves, the pair of sprocket-chains connecting said wheels, the cross-head reciprocating adjacent the chains, mechanism carried by said cross-head adapted to engage the upper or lower run of one or the other of said chains, the yoke-shaped levers engaging the usual channels in the sleeves, and means for moving said yoke-shaped levers.

14. In a device of the class described, the combination with a pair of driven shafts, each carrying a sleeve splined thereon and hav-

ing the channel therein, of the pair of sprocket-wheels carried by each of said sleeves, the pair of sprocket-chains connecting said wheels, the cross-head reciprocating adjacent the chains, mechanism carried by said cross-head adapted to engage the upper or lower run of one or the other of said chains, the yoke-shaped levers engaging the usual channels in the sleeves, and means for moving said yoke-shaped levers, consisting of the common lever connecting the upper ends of said yoke-shaped levers.

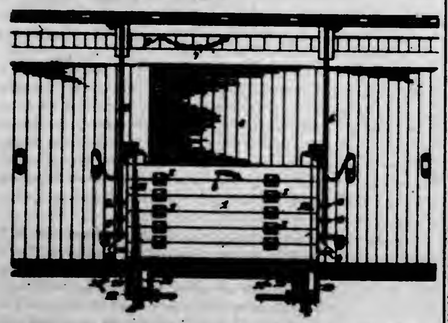
811,689. **BOTTLE-WRAPPER.** FRED W. R. BRADFORD, Malvern, Mass. Filed June 29, 1905. Serial No. 267,543.



Claim.—1. In a bottle-wrapper for application to a bottle whose body portion is substantially rectangular in cross-section, the combination with the body-sections, of four flat extensions projecting upward therefrom and converging without meeting at their upper ends whereby an opening is provided for the upper end of the neck of the bottle, and means for locking said extensions together at their side edges whereby the four extensions completely surround the neck of the bottle but allow it to project through the upper end of the wrapper.

2. In a bottle-wrapper of the character described, the combination with the body-sections, of extensions projecting upward from the side body-sections, extensions projecting upward from the end body-sections, wings extending from the opposite side edges of the extensions from the end body-sections, neck portions extending upward from the extensions from the body-sections, and tongues extending from opposite side edges of alternate neck portions and provided with slits extending downward and upward respectively from the upper and lower edges thereof, whereby the tongues extending from said alternate neck portions are adapted to extend toward each other around the neck and interlock by means of adjacent slits, for the purpose set forth.

811,690. **PNEUMATIC LIFTING MEANS FOR GRAIN-DOORS.** TELEMAN B. BRANDON, Bellefontaine, Kans., assignor of one-third to Harry Hatfield and one-third to W. S. Foster, Bellefontaine, Kans. Filed Mar. 28, 1905. Serial No. 251,668.



Claim.—1. The combination with a car having a grain-door, of a cylinder having a grain-door-lifting piston, said grain-door being movable independently of the piston, and means for actuating the piston to raise the door.

2. The combination with a car having a grain-door, of a vertical cylinder located beneath the door and having a piston for partially opening the same, said door being movable independently of the piston to enable it to be completely opened, means for actuating the piston in its door-opening movement, and means for permitting the said piston to return to its initial position after the door has been partially opened.

3. The combination with a car having a vertically-movable grain-door, of a grain-door carrier arranged to detachably receive the door and slidable on the car, and permitting the door to have an independent opening and closing movement and pneumatic lifting mechanism embodying a cylinder having a piston or plunger arranged to move the carrier upward.

4. The combination with a car having opposite grain-doors, of a storage tank or reservoir, vertical cylinders mounted beneath the car and having pistons or plungers arranged to raise the grain-doors to partially open the same, pipes connecting the cylinders with the storage tank or reservoir, and means for controlling the admission of fluid-pressure to the cylinders for permitting an independent operation of the doors.

5. The combination with a car having a grain-door, of lifting mechanism embodying a storage tank or reservoir, cylinders located beneath the car and having pistons for lifting the door, pipes connecting the cylinders with the storage tank or reservoir, and a valve located between the inner ends of the pipes for controlling the discharge of the fluid-pressure from the storage tank or reservoir and the admission of the same into the cylinders.

6. The combination with a car having a grain-door, of lifting mechanism embodying a fluid-pressure storage tank or reservoir, vertical cylinders located beneath the door and having pistons for lifting the same, branch pipes connecting the storage tank or reservoir with the lower ends of the cylinders, a valve located at the storage tank or reservoir for controlling the discharge of the fluid-pressure, and independent valves mounted on the cylinders for controlling the admission of the fluid-pressure to the cylinders.

7. The combination with a car having opposite grain-doors, of a fluid-pressure storage tank or reservoir, cylinders arranged in pairs for lifting the grain-doors, branch pipes also disposed in pairs and extending from the storage tank or reservoir to the cylinders, and independent valves for controlling the discharge of fluid-pressure from the tank or reservoir and the admission of the same into the cylinders.

8. The combination with a car having a grain-door, of a fluid-pressure storage tank or reservoir, cylinders having pistons for raising the grain-door, branch pipes extending from the storage tank or reservoir to the cylinders, a valve mounted on the tank or reservoir, and having lateral passages communicating with the said branch pipes, said valve-casing being provided between the passages and the storage tank or reservoir with a valve-seat, and a valve-plug arranged to engage the seat for controlling the discharge of the fluid-pressure.

9. The combination with a door, of hoisting mechanism arranged normally in position for engaging the door to partially open the same, said hoisting mechanism having a detachable connection with the door to permit the latter to have a continued independent movement after the hoisting mechanism has raised the door and dropped back to its normal position.

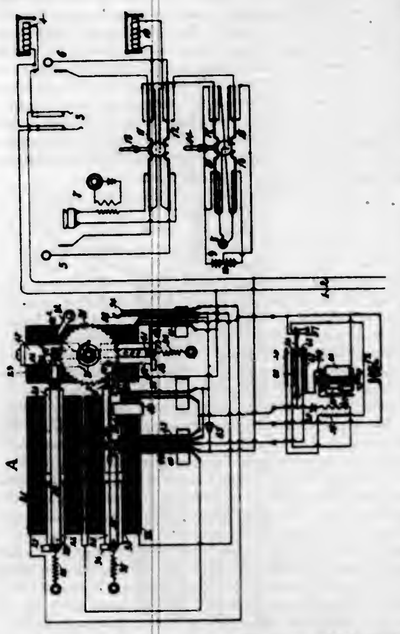
811,691. **PARTY TELEPHONE-LINE.** EDWARD A. BUELL, DeKalb, Ill. Filed Mar. 17, 1905. Serial No. 250,681.

Claim.—1. A telephone-line having a plurality of subscribers' stations associated therewith to constitute the same a party telephone-line, each of said subscribers' stations including selecting switching mechanism having a magnet in circuit relation with the line, a ratchet-wheel, a pawl operated by the magnet to escape the teeth of the ratchet-wheel, a spring operating upon the pawl to cause the same to move the ratchet-wheel, and a second magnet governing the circuit of the aforesaid magnet.

2. A telephone-line having a plurality of subscribers' stations associated therewith to constitute the same a party telephone-line, each of said subscribers' stations including selecting switching mechanism having a magnet in circuit relation with the line, a ratchet-wheel, a pawl operated by the magnet to escape the teeth of the ratchet-wheel, a spring operating upon the pawl to cause the same to move the ratchet-wheel, and a second magnet in circuit relation with the party-line governing the circuit of the aforesaid magnet.

3. A telephone-line having a plurality of subscribers' stations associated therewith to constitute the same a party telephone-line, each of said subscribers' stations including selecting switching mechanism having a magnet in circuit relation with the line, a ratchet-wheel, a pawl operated by the magnet to escape the teeth of the

ratchet-wheel, a spring operating upon the pawl to cause the same to move the ratchet-wheel, a dog preventing premature restoration of said wheel, and a releasing-magnet for moving said pawl and dog out of mechanical relation with the ratchet-wheel to permit its restoration.



4. A telephone-line having a plurality of subscribers' stations associated therewith to constitute the same a party telephone-line, each of said subscribers' stations including selecting switching mechanism having a magnet in circuit relation with the line, a ratchet-wheel, a pawl operated by the magnet to escape the teeth of the ratchet-wheel, a spring operating upon the pawl to cause the same to move the ratchet-wheel, a second magnet governing the circuit of the aforesaid magnet, a dog preventing premature restoration of said wheel, and a releasing-magnet for moving said pawl and dog out of mechanical relation with the ratchet-wheel to permit its restoration.

5. A telephone-line having a plurality of subscribers' stations associated therewith to constitute the same a party telephone-line, each of said subscribers' stations including selecting switching mechanism having a magnet in circuit relation with the line, a ratchet-wheel, a pawl operated by the magnet to escape the teeth of the ratchet-wheel, a spring operating upon the pawl to cause the same to move the ratchet-wheel, a second magnet in circuit relation with the party-line governing the circuit of the aforesaid magnet, a dog preventing premature restoration of said wheel, and a releasing-magnet for moving said pawl and dog out of mechanical relation with the ratchet-wheel to permit its restoration.

6. A telephone-line having a plurality of subscribers' stations associated therewith to constitute the same a party telephone-line, each of said subscribers' stations including selecting switching mechanism having a magnet in circuit relation with the line, a ratchet-wheel, a pawl operated by the magnet to escape the teeth of the ratchet-wheel, a spring operating upon the pawl to cause the same to move the ratchet-wheel, a second magnet governing the circuit of the aforesaid magnet, a dog preventing premature restoration of said wheel, and a releasing-magnet in circuit relation with the line for moving said pawl and dog out of mechanical relation with the ratchet-wheel to permit its restoration.

7. A telephone-line having a plurality of subscribers' stations associated therewith to constitute the same a party telephone-line, each of said subscribers' stations including selecting switching mechanism having a magnet in circuit relation with the line, a ratchet-wheel, a pawl operated by the magnet to escape the teeth of the ratchet-wheel, a spring operating upon the pawl to cause the same to move the ratchet-wheel, a second magnet governing the circuit of the aforesaid magnet, a dog preventing premature restoration of said wheel, and a releasing-magnet in circuit relation with the line for moving said pawl and dog out of mechanical relation with the ratchet-wheel to permit its restoration.

8. A party-line subscriber's station having selecting switching mechanism including a magnet, step-by-step mechanism operated through the agency of said magnet, which thus constitutes a selecting-magnet, a governing-magnet, switching mechanism operated by the governing-magnet and controlling the circuit of the selecting-magnet, detent mechanism for holding the latter switching mechanism in the position to which it is operated by the governing-magnet, and a releasing-magnet and mechanism operated thereby for releasing the detent mechanism to permit of restoration of the latter switching mechanism.

9. A party-line subscriber's station having selecting switching mechanism including a magnet, step-by-step mechanism operated through the agency of said magnet, which thus constitutes a selecting-magnet, a governing-magnet, switching mechanism controlling the circuits of the selecting-magnet and signal-receiver, detent mechanism for holding the latter switching mechanism in the position to which it is operated by the governing-magnet, and a releasing-magnet and mechanism operated thereby for releasing the detent mechanism to permit of restoration of the latter switching mechanism.

10. A party-line subscriber's station having selecting switching mechanism including a magnet, step-by-step mechanism operated through the agency of said magnet, which thus constitutes a selecting-magnet, a governing-magnet, switching mechanism governing the circuits of the selecting-magnet and telephone, detent mechanism for holding the latter switching mechanism in the position to which it is operated by the governing-magnet, and a releasing-magnet and mechanism operated thereby for releasing the detent mechanism to permit of restoration of the latter switching mechanism.

11. A party-line subscriber's station having selecting switching mechanism including a magnet, step-by-step mechanism operated through the agency of said magnet, which thus constitutes a selecting-magnet, a governing-magnet, switching mechanism governing the telephone, signal-receiver and selecting-magnet circuits, detent mechanism for holding the latter switching mechanism in the position to which it is operated by the governing-magnet, and a releasing-magnet and mechanism operated thereby for releasing the detent mechanism to permit of restoration of the latter switching mechanism.

12. A party-line subscriber's station having selecting switching mechanism including a releasing-magnet for restoring the selecting mechanism to its normal condition, and a switching device operated by the releasing-magnet for opening the signal-receiving circuit.

13. A telephone-line having a plurality of subscribers' stations associated therewith, to constitute the same a party telephone-line, each of said subscribers' stations including selecting switching mechanism having a magnet in circuit relation with the line, a ratchet-wheel, a pawl operated by the magnet, to escape the teeth of the ratchet-wheel, a spring operating upon the pawl, to cause the same to move the ratchet-wheel in one direction, a spring for effecting the movement of the ratchet-wheel in a reverse direction, and a second magnet governing the circuit of the aforesaid magnet.

14. A telephone-line having a plurality of subscribers' stations associated therewith, to constitute the same a party telephone-line, each of said subscribers' stations including selecting switching mechanism having a magnet in circuit relation with the line, a ratchet-wheel, a pawl operated by the magnet, to escape the teeth of the ratchet-wheel, a spring operating upon the pawl, to cause the same to move the ratchet-wheel in one direction, a spring for effecting the movement of the ratchet-wheel in a reverse direction, and a second magnet in circuit relation with the party-line governing the circuit of the aforesaid magnet.

15. A telephone-line having a plurality of subscribers' stations associated therewith, to constitute the same a party telephone-line, each of said subscribers' stations including selecting switching mechanism having a magnet in circuit relation with the line, a ratchet-wheel, a pawl operated by the magnet, to escape the teeth of the ratchet-wheel, a spring operating upon the pawl, to cause the same to move the ratchet-wheel in one direction, a spring for effecting the movement of the ratchet-wheel in a reverse direction, a second magnet governing the circuit of the aforesaid magnet, a dog preventing premature restoration of said wheel, and a releasing-magnet for moving said pawl and dog out of mechanical relation with the ratchet-wheel, to permit its restoration.

16. A telephone-line having a plurality of subscribers' stations associated therewith, to constitute the same a party telephone-line, each of said subscribers' stations including selecting switching

mechanism having a magnet in circuit relation with the line, a ratchet-wheel, a pawl operated by the magnet, to escape the teeth of the ratchet-wheel, a spring operating upon the pawl, to cause the same to move the ratchet-wheel in one direction, a spring for effecting the movement of the ratchet-wheel in a reverse direction, a second magnet in circuit relation with the party-line governing the circuit of the aforesaid magnet, a dog preventing premature restoration of said wheel, and a releasing-magnet for moving said pawl and dog out of mechanical relation with the ratchet-wheel, to permit its restoration.

17. A telephone-line having a plurality of subscribers' stations associated therewith, to constitute the same a party telephone-line, each of said subscribers' stations including selecting switching mechanism having a magnet in circuit relation with the line, a ratchet-wheel, a pawl operated by the magnet, to escape the teeth of the ratchet-wheel, a spring operating upon the pawl to cause the same to move the ratchet-wheel in one direction, means for effecting the movement of the ratchet-wheel in a reverse direction, and a second magnet governing the circuit of the aforesaid magnet.

18. A telephone-line having a plurality of subscribers' stations associated therewith, to constitute the same a party telephone-line, each of said subscribers' stations including selecting switching mechanism having a magnet in circuit relation with the line, a ratchet-wheel, a pawl operated by the magnet, to escape the teeth of the ratchet-wheel, a spring operating upon the pawl, to cause the same to move the ratchet-wheel in one direction, means for effecting the movement of the ratchet-wheel in a reverse direction, and a second magnet in circuit relation with the party-line governing the circuit of the aforesaid magnet.

19. A telephone-line having a plurality of subscribers' stations associated therewith, to constitute the same a party telephone-line, each of said subscribers' stations including selecting switching mechanism having a magnet in circuit relation with the line, a ratchet-wheel, a pawl operated by the magnet, to escape the teeth of the ratchet-wheel, a spring operating upon the pawl, to cause the same to move the ratchet-wheel in one direction, means for effecting the movement of the ratchet-wheel in a reverse direction, a second magnet governing the circuit of the aforesaid magnet, a dog preventing premature restoration of said wheel, and a releasing magnet for moving said pawl and dog out of mechanical relation with the ratchet-wheel, to permit its restoration.

20. A telephone-line having a plurality of subscribers' stations associated therewith, to constitute the same a party telephone-line, each of said subscribers' stations including selecting switching mechanism having a magnet in circuit relation with the line, a ratchet-wheel, a pawl operated by the magnet, to escape the teeth of the ratchet-wheel, a spring operating upon the pawl, to cause the same to move the ratchet-wheel in one drection, means for effecting the movement of the ratchet-wheel in a reverse direction, a second magnet in circuit relation with the party-line governing the circuit of the aforesaid magnet, a dog preventing premature restoration of said wheel, and a releasing-magnet for moving said pawl and dog out of mechanical relation with the ratchet-wheel, to permit its restoration.

21. A party telephone-line extending from a plurality of subscribers' stations to an exchange, each subscriber's station having thereat a signaling-generator, a signal receiver or bell, switching mechanism serving, when unset, to permit of operative association between the signaling-generator and the line and between the telephone and the line, and, when actuated, to dissociate the generator and telephone from the line, additional switching mechanism for establishing operative association between the telephone and the line at a selected station, a detent engaging an actuated portion of the additional switching mechanism to hold the same in the position to to which it is set, electromagnetic apparatus governing the aforesaid switching mechanisms and also operating to break the engagement of the detent at a selected station, and apparatus at the exchange for governing the operation of the electromagnetic mechanisms at the different stations.

22. A party telephone-line extending from a plurality of subscribers' stations to an exchange, each subscriber's station having thereat a signaling-generator, a signal receiver or bell, switching mechanism serving, when unset, to permit of operative association between the signaling-generator and the line, and, when actuated, to dissociate the generator from the line, additional switching mechanism for establishing operative association between the telephone and the line at a selected station, a detent engaging an actuated portion of the additional switching mechanism to hold the same in the position to which it is set, electromagnetic apparatus governing the aforesaid switching mechanisms and also operating to break the engagement of the detent at a selected station, and apparatus at the exchange for governing the operation of the electromagnetic mechanisms at the different stations.

23. A party telephone-line extending from a plurality of subscribers' stations to an exchange, each substriber's station having thereat a signaling-generator, a signal receiver or bell, switching mechanism serving, when unset, to permit of operative association between the signaling-generator and the line, and, when actuated, to dissociate the generator from the line, additional switching mechanism for establishing operative association between the signal-receiver and the line at a selected station, a detent engaging an actuated portion of the additional switching mechanism to hold the same in the position to which it is set, electromagnetic apparatus governing the aforesaid switching mechanisms and also operating to break the engagement of the detent at a selected station, and apparatus at the exchange for governing the operation of the electromagnetic mechanisms at the different stations.

24. A party telephone-line extending from a plurality of subscribers' stations to an exchange, each subscriber's station having thereat a telephone, switching mechanism serving, when unset, to permit of operative association between the telephone and the line, and, when actuated, to dissociate the telephone from the line, additional switching mechanism for testablishing operative association between the telephone and the line at a selected station, a detent engaging an actuated portion of the additional switching mechanism to hold the same in the position to which it is set, electromagnetic apparatus governing the aforesaid switching mechanisms and also operating to break the engagement of the detent at a selected station, and apparatus at the exchange for governing the operation of the electromagnetic mechanisms at the different stations.

25. A party telephone-line extending from a plurality of subscribers' stations to an exchange, switching mechanism for establishing operative association between the telephone and the line at a selected station, a detent engaging an actuated portion of said switching mechanism to hold the same in the position to which it is set, electromagnetic apparatus governing the aforesaid switching mechanism and also operating to break the engagement of the detent at a selected station, and apparatus at the exchange for governing the operation of the electromagnetic mechanisms at the different stations.

26. A party telephone-line extending from a plurality of subscribers' stations to an exchange, switching mechanism for establishing operative association between the telephone and the line at a selected station, a detent engaging an actuated portion of said switching mechanism to hold the same in the position to which it is set, electromagnetic apparatus governing the aforesaid switching mechanism and also operating to break the engagement of the detent at a selected station, and apparatus for governing the operation of the electromagnetic mechanisms at the different stations.

27. Substation apparatus for party telephone-lines, including switching mechanism serving to control the association of the telephone with the line, a detent for holding the switching mechanism in the position to which is has been actuated, and electromagnetic mechanism for operating the said switching mechanism, to permit the detent to engage the same, and for breaking the engagement of the detent from connection with the switching mechanism.

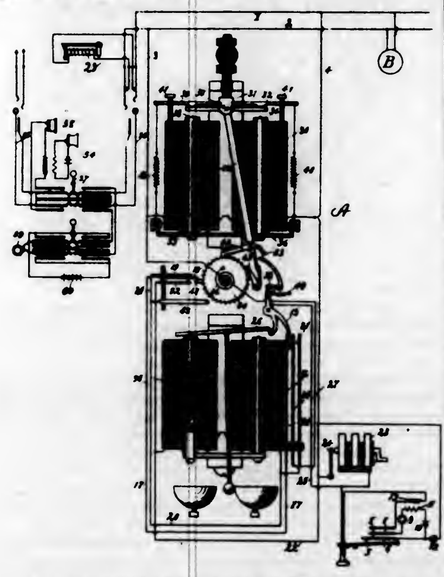
28. Substation apparatus for party telephone-lines, including switching mechanism serving to control the association of the telephone with the line, a detent for holding the switching mechanism in the position to which it has been actuated, and electromagnetic mechanism for operating the said switching mechanism, to permit the detent to engage the same, and for breaking the engagement of the detent from connection with the switching mechanism, in combination with switching apparatus at an exchange for effecting the operation of said electromagnetic mechanism.

29. A party telephone-line extending from a plurality of substations to an exchange, signaling-generators at the substations, switching mechanism for establishing operative association between the signaling-generators and the line at the different stations, electromagnetic apparatus governing the aforesaid switching mechanism, and apparatus at the exchange for governing the operation of the electromagnetic mechanisms at the different stations.

30. A telephone-line extending from a substation to an exchange, a signaling-generator at the substation, switching mechanism for establishing operative association between the generator and the line, electromagnetic mechanism governing the operation of the switching mechanism, and apparatus at the exchange for governing the operation of the electromagnetic mechanism.

811,692. PARTY TELEPHONE-LINE. EDWARD A. BUELL, DeKalb, Ill. Filed May 1, 1905. Serial No. 258,276.

Claim.—1. A telephone-exchange system, including a party-line extending from a plurality of subscribers' stations to an exchange, each of said subscribers' stations having a signal bell or receiver, a signaling-generator, switching apparatus for controlling the association of the signaling-generator and signal-receiver with the line, selective mechanism governing the said switching apparatus and serving, when in an unselected condition, to effect dissociation between the signal-receiver and signaling-generator and the line, and, when in a selected position, to bring about the association of said signal-receiver and signaling-generator with the line, and apparatus at the exchange for operating the selective mechanism at the different stations, whereby the switching apparatus at the different stations may be operated to place the signal-receivers and signaling-generators thereat in connection with the line.



2. A telephone-exchange system, including a party-line extending from a plurality of subscribers' stations to an exchange, each of said subscribers' stations having a signal bell or receiver, a signaling-generator, switching apparatus for controlling the association of the signaling-generator, signal-receiver and telephone with the line, selective mechanism governing the said switching apparatus and serving, when in an unselected condition, to effect dissociation between the signal-receiver, the signaling-generator, the telephone, and the line, and, when in a selected position, to bring about the association of said signal-receiver, signaling-generator and telephone with the line, and apparatus at the exchange for operating the selective mechanism at the different stations, whereby the switching apparatus at the different stations may be operated to place the signal-receivers, signaling-generators and telephones thereat in connection with the line.

3. A telephone-exchange system, including a party-line extending from a plurality of subscribers' stations to an exchange, each of said subscribers' stations having a signaling-generator, a signal bell or receiver, switching apparatus for controlling the association of the signaling-generator and telephone with the line, selective mechanism governing the said switching apparatus and serving, when in an unselected condition, to effect dissociation between the signaling-generator, the telephone, and the line, and, when in a selected position, to bring about the association of said signaling-generator and telephone with the line, and apparatus at the exchange for operating the selective mechanism at the different stations, whereby the switching apparatus at the different stations may be operated to place the signaling-generators and telephones thereat in connection with the line.

4. A telephone-line, having a plurality of subscribers' stations thereon to constitute the same a party-line, each subscriber's station including a signal-receiver, a signaling-generator normally in operative relation therewith, and switching apparatus governing the association of the signal-receiver and telephone thereat with the line and operated by the signal-receiver.

5. A telephone-line, having a plurality of subscribers' stations thereon to constitute the same a party-line, each subscriber's station including a signal-receiver, a signaling-generator normally in operative relation therewith, and switching apparatus governing the association of the signal-receiver thereat with the line and operated by the signal-receiver.

6. A telephone-line, having a plurality of subscribers' stations thereon to constitute the same a party-line, selective mechanism at each station, a signal bell or receiver and switching apparatus at each station governing the association of the signal-receiver thereat with the line and governed by the signal-receiver, and apparatus at the exchange for operating the selective mechanisms at the different stations.

7. A telephone-line, having a plurality of subscribers' stations thereon to constitute the same a party-line, selective mechanism at each station, a signal bell or receiver and switching apparatus at each station governing the association of the signal-receiver and telephone thereat with the line and governed by the signal-receiver, and apparatus at the exchange for operating the selective mechanisms at the different stations.

8. A subscriber's station equipment, including a signal-receiver, a signaling-generator normally in operative relation with the signal-receiver, and switching mechanism operated by the signal-receiver and serving to control the association of the telephone and signaling-generator with the line.

9. A subscriber's station equipment, including a signal-receiver, a signaling-generator normally in operative relation with the signal-receiver, and switching mechanism operated by the signal-receiver and serving to control the association of the signal-receiver with the line.

10. A subscriber's station equipment, including a signal-receiver, a signaling-generator normally in operative relation with the signal-receiver, and switching mechanism operated by the signal-receiver and serving to control the association of the telephone, signal-receiver and generator with the line.

11. A subscriber's station equipment, including a signal-receiver, a signaling-generator normally in operative relation with the signal-receiver, and switching mechanism operated by the signal-receiver and serving to control the association of the telephone and signal-receiver with the line.

12. A subscriber's station equipment, including a signal-receiver, a signaling-generator normally in operative relation with the signal-receiver, and switching mechanism operated by the signal-receiver and serving to control the association of the signal-receiver and generator with the line.

13. A subscriber's station equipment, including a signal-receiver, a signaling-generator, and switching mechanism operated by the signaling-generator and serving to control the association of the telephone and signaling-generator with the line.

14. A subscriber's station equipment, including a signal-receiver, a signaling-generator, and switching mechanism operated by the signaling-generator and serving to control the association of the signal-receiver with the line.

15. A subscriber's station equipment, including a signal-receiver, a signaling-generator, and switching mechanism operated by the signaling-generator and serving to control the association of the telephone with the line.

16. A subscriber's station equipment, including a signal-receiver, a signaling-generator, and switching mechanism operated by the signaling-generator and serving to control the association of the telephone, signal-receiver and generator with the line.

17. A subscriber's station equipment, including a signal-receiver, a signaling-generator, and switching mechanism operated by the signaling-generator and serving to control the association of the telephone and signal-receiver with the line.

18. A subscriber's station equipment, including a signal-receiver, a signaling-generator, and switching mechanism operated by the signaling-generator and serving to control the association of the signal-receiver and generator with the line.

19. Substation apparatus for party telephone-lines including switching mechanism, a detent for holding the switching mechanism in the position to which it has been actuated, and electromagnetic mechanism including a signal-receiver for the substation, and serving to operate the said switching mechanism, to permit the detent to engage the same and for releasing the detent from connection with the said switching mechanism.

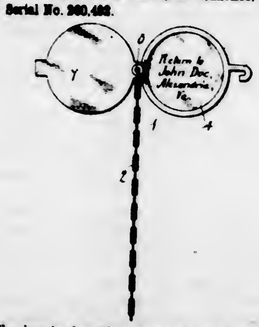
20. Substation apparatus for party telephone-lines, switching

mechanism, a detent for holding the switching mechanism in the

mechanism, a detent for holding the switching mechanism in the position to which it has been actuated, and electromagnetic mechanism for releasing the detent from connection with the switching mechanism, including a signal-receiver, which receiver serves to operate the switching mechanism, to permit the detent to engage the same.

21. A telephone-exchange system, including a party-line extending from a plurality of subscribers' stations to an exchange, each of said subscribers' stations having a signal bell or receiver, a signaling-generator, switching apparatus for controlling the association of the signaling-generator and signal-receiver with the line, selective mechanism governing the said switching apparatus and serving, when in an unselected condition, to effect dissociation between the signaling-generator and the line, and, when in a selected position, to bring about the association of said signaling-generator with the line, and apparatus at the exchange for operating the selective mechanism at the different stations, whereby the switching apparatus at the different stations may be operated to place the signaling-generators thereat in connection with the line.

811,693. KEY-RING. JOSÉ CALVO, San Francisco, Cal. Filed May 15, 1905. Serial No. 260,462.



Claim.—The herein-described key-ring and tag comprising a depressed plate having an integral hook on one side thereof and a perforated lug on the other side opposite the hook, a cover for said plate having a perforated lug on one side thereof, and a projection to close the hook on the opposite side thereof, said perforated lugs being connected by an eyelet, a chain connected to said eyelet, said lug on the cover being adapted to be swung upon the eyelet as a pivot to close the hook on the depressed plate, substantially as described.

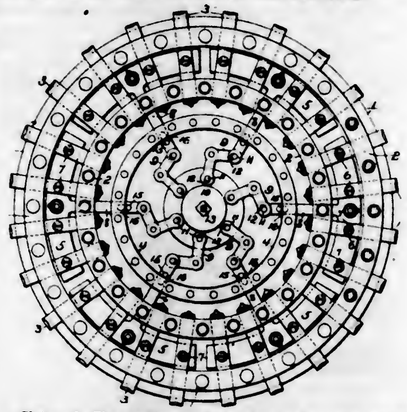
811,694. SEED-HARVESTER. THOMAS J. CAMPBELL, Lathrop, Mo. Filed June 20, 1904. Serial No. 213,259.

Claim.—1. In a machine of the class described, the combination of a frame, a stripping-bar at the front of the frame, said bar being angular in cross-section, an upwardly and rearwardly inclined support for the material, the forward end of the support being contiguous to said bar, a stripping-cylinder carrying fingers and arranged in operative relation to said bar and the forward end of said support, and a vibratory shouldered and apertured seed-separator in lapped relation to said support.

2. In a machine of the class described, the combination of a frame, a stripping-bar at the front of the frame, said bar being angular in cross-section, an upwardly and rearwardly inclined support for the material, the forward end of the support being contiguous to said bar, a stripping-cylinder carrying fingers and arranged in operative relation to said bar and the forward end of said support, a vibratory shouldered and apertured seed-separator in lapped relation to said support, and an elevator for the separated seed, consisting of an endless apron having a horizontal traverse and an upwardly-inclined traverse, and a second inclined apron contacting during a portion of its traverse with the first-named apron.

3. In a machine of the class described, a stripping-cylinder having a series of segments removably secured in place, stripping-fingers extending from said segments, a metal strip having holes for the fingers, and removably-secured cross-plates for securing the strip.

811,695. BOLTWORK FOR CIRCULAR DOORS. JOSEPH B. CAMBELL, New York, N. Y., assignor to Remington and Sherman Company, Philadelphia, Pa. Filed Apr. 8, 1905. Serial No. 254,545.



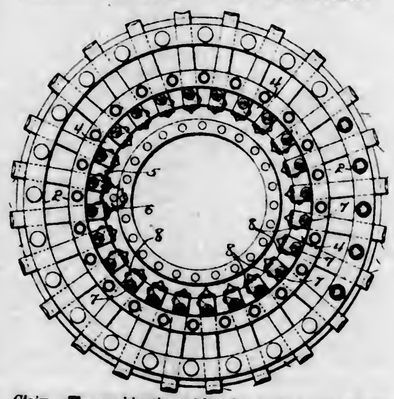
Claim.—1. The combination with a circular door, and a series of radially-disposed bolts thereon, of a series of segments each being movably connected with a plurality of bolts, and means for simultaneously moving all the segments.

2. The combination with a circular door, and a series of radially-disposed bolts thereon, of a series of segments, each being movably connected with a plurality of bolts, and means at the center of the door for simultaneously moving said segments.

3. The combination with a circular door, of parallel rings thereon having alined openings, radially-disposed bolts in said openings, a series of segments around the door each segment movably connected with a plurality of bolts, arms on the segments, and means at the center of the door for simultaneously moving said arms.

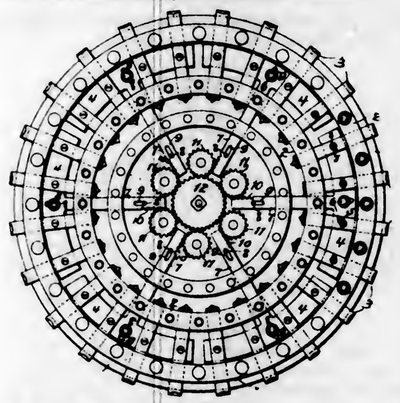
4. The combination with a circular door, and a series of radially-disposed bolts around the same, of a series of segments around the door and each segment movably connected with a plurality of bolts, arms on the segments, a rotary device at the center of the door, and bell-crank levers connecting the arms with said rotary device.

811,696. BOLTWORK FOR CIRCULAR DOORS. JOSEPH B. CAMBELL, New York, N. Y., assignor to Remington and Sherman Company, Philadelphia, Pa. Filed Apr. 10, 1905. Serial No. 254,696.



Claim.—The combination with a door and a series of radially-disposed bolts thereon, of a movable ring having a cam-slot for each and every bolt, pins carried by the bolts and located in the slots, gear-teeth on said ring and an operating-pinion meshing therewith.

811,697. BOLTWORK FOR CIRCULAR DOORS. JOSEPH B. CAMBELL, New York, N. Y., assignor to Remington and Sherman Company, Philadelphia, Pa. Filed Apr. 11, 1905. Serial No. 254,961.

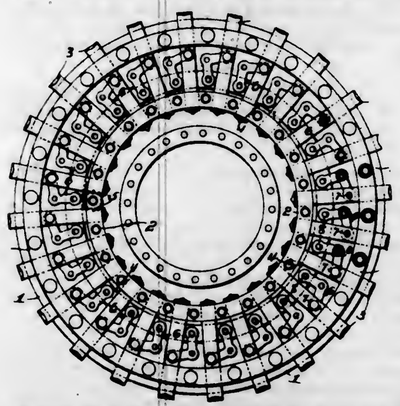


Claim.—1. The combination with a door and a series of radially-disposed bolts thereon, of a series of bars or segments each movably connected with a plurality of bolts, pinions for moving the segments and a pinion controlling all of the first-mentioned pinions.

2. The combination with a door and a series of radially-disposed bolts thereon, of a series of bars or segments each movably connected with a plurality of bolts and provided with an arm having rack-teeth, pinions engaging said racks, and means for simultaneously turning said pinions.

3. The combination with a door, and radially-disposed bolts thereon, of segments, each segment movably connected with a number of bolts, inwardly-projecting arms on the segments having gear-teeth thereon forming racks, pinions engaging said racks, and a central pinion in mesh with all of said first-mentioned pinions.

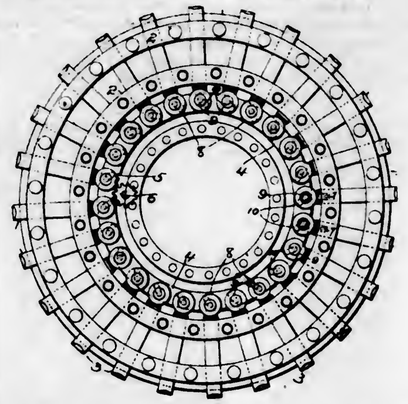
811,698. BOLTWORK FOR CIRCULAR DOORS. JOSEPH B. CAMBELL, New York, N. Y., assignor to Remington and Sherman Company, Philadelphia, Pa. Filed Apr. 11, 1905. Serial No. 254,963.



Claim.—1. The combination with a door, fixed rings thereon, and radially-disposed bolts mounted in said fixed rings, of bell-crank levers fulcrumed to the door and one located adjacent to each bolt and connected at one end thereto, and a ring movable about one of the fixed rings and connected with all of the levers.

2. The combination with a door and radially-disposed bolts thereon, of a bell-crank lever pivoted to the door beside each bolt, pins on the bolts projecting into slots in one end of the levers, a movable ring, pins thereon projecting into slots in the other ends of the levers, gear-teeth on said movable ring forming a rack, and an operating-pinion engaging said rack.

811,699. BOLTWORK FOR CIRCULAR DOORS. JOSEPH B. CAMBELL, New York, N. Y., assignor to Remington and Sherman Company, Philadelphia, Pa. Filed Apr. 12, 1905. Serial No. 255,116.

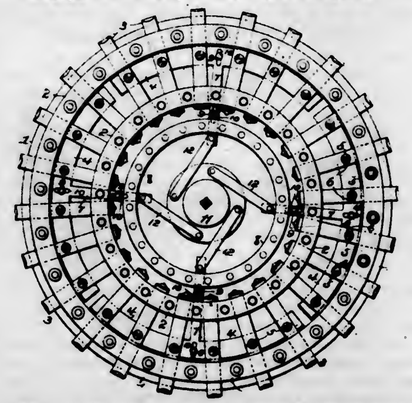


Claim.—1. The combination with a circular door, and a series of radially-disposed bolts thereon, of a movable ring on the door, removable heads secured to the inner ends of the bolts, and means connecting said heads and movable ring and operating to compel the movement of the bolts when the ring is moved.

2. The combination with a circular door, and a series of radially-disposed bolts thereon, of a movable ring on the door having cam-slots therein, heads removably secured to the inner ends of the bolts, and pins carried by said heads and projecting into the cam-slots of the movable ring.

3. The combination with a circular door, parallel fixed rings thereon, and radially-disposed bolts mounted in said rings, of a movable ring located inside the inner fixed ring and having cam-slots therein, removable heads on the inner ends of the bolts, pins carried by said heads and projecting into the cam-slots of the movable ring, gear-teeth on said movable ring, and an operating-pinion engaging said gear-teeth.

811,700. BOLTWORK FOR CIRCULAR DOORS. JOSEPH B. CAMBELL, New York, N. Y., assignor to Remington and Sherman Company, Philadelphia, Pa. Filed Apr. 13, 1905. Serial No. 255,300.



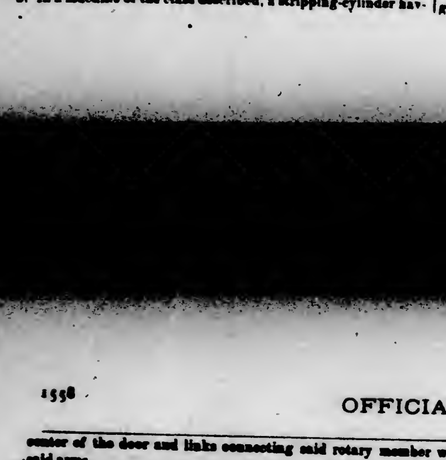
Claim.—1. The combination with a door and a series of radially-disposed bolts arranged in circular form on the door, of a series of segments each being movably connected with a plurality of bolts, a rotary member at the center of the door, and links connecting said rotary member with the segments.

2. The combination with a circular door and a series of radially-disposed bolts arranged in circular form on the door, of a series of segments each being movably connected with a plurality of bolts, an inwardly-projecting arm on each segment, a rotary member at the

center of the door and links connecting said rotary member with said arms.

3. The combination with a circular door, parallel fixed rings thereon, and radially-disposed bolts mounted in said rings, of a movable ring located inside the inner fixed ring and having cam-slots therein, removable heads on the inner ends of the bolts, pins carried by said heads and projecting into the cam-slots of the movable ring, gear-teeth on said movable ring, and an operating-pinion engaging said gear-teeth, and a spring-pressed latch engaging said gear-teeth.

811,701. DISPLAY DEVICE. JOSEPH BARNETT, Chicago, Ill. Filed Aug. 28, 1905. Serial No. 276,102.



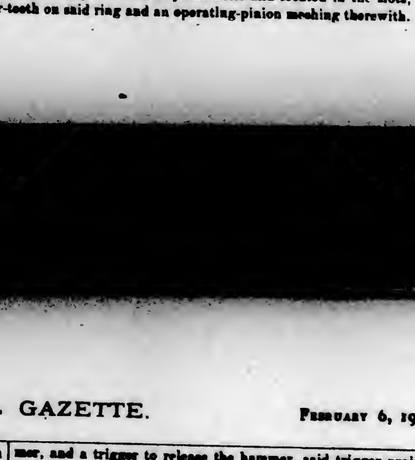
Claim.—1. In a display device, the combination with a revoluble display element, of a hammer, and a trigger to release the hammer, said trigger projecting into the path of the revoluble display element for operation thereby.

2. In a display device, the combination with a revoluble display element, of a hammer, a trigger to release the hammer, said trigger projecting into the path of the revoluble display element for operation thereby, and a spring for returning the trigger to its normal position.

3. In a display device, the combination with a revoluble display element, of a hammer, a trigger to release the hammer, said trigger projecting into the path of the revoluble display element for operation thereby, and a spring for returning the trigger to its normal position, said spring being adjustable.

4. In a display device, the combination with a revoluble display element, of a hammer, a trigger to release the hammer, said trigger projecting into the path of the revoluble display element for operation thereby, and a spring for returning the trigger to its normal position, said spring being adjustable, and a stop for limiting the movement of the trigger.

811,702. ELECTRIC CIRCUIT-CONTROLLER. JOSEPH BARNETT, Chicago, Ill. Filed Aug. 28, 1905. Serial No. 276,103.

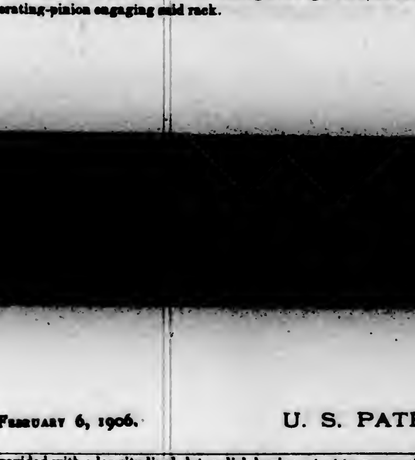


Claim.—1. In an electric circuit-controller, the combination with a revoluble display element, of a hammer, a trigger to release the hammer, said trigger projecting into the path of the revoluble display element for operation thereby, and a spring for returning the trigger to its normal position.

2. In an electric circuit-controller, the combination with a revoluble display element, of a hammer, a trigger to release the hammer, said trigger projecting into the path of the revoluble display element for operation thereby, a spring for returning the trigger to its normal position, said spring being adjustable.

3. In an electric circuit-controller, the combination with a revoluble display element, of a hammer, a trigger to release the hammer, said trigger projecting into the path of the revoluble display element for operation thereby, a spring for returning the trigger to its normal position, said spring being adjustable, and a stop for limiting the movement of the trigger.

811,703. ELECTRIC CIRCUIT-CONTROLLER. JOSEPH BARNETT, Chicago, Ill. Filed Aug. 28, 1905. Serial No. 276,104.

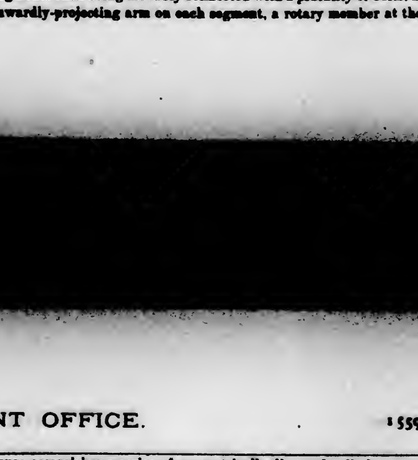


Claim.—1. In an electric circuit-controller, the combination with a revoluble display element, of a hammer, a trigger to release the hammer, said trigger projecting into the path of the revoluble display element for operation thereby, and a spring for returning the trigger to its normal position.

2. In an electric circuit-controller, the combination with a revoluble display element, of a hammer, a trigger to release the hammer, said trigger projecting into the path of the revoluble display element for operation thereby, a spring for returning the trigger to its normal position, said spring being adjustable.

3. In an electric circuit-controller, the combination with a revoluble display element, of a hammer, a trigger to release the hammer, said trigger projecting into the path of the revoluble display element for operation thereby, a spring for returning the trigger to its normal position, said spring being adjustable, and a stop for limiting the movement of the trigger.

811,704. ELECTRIC CIRCUIT-CONTROLLER. JOSEPH BARNETT, Chicago, Ill. Filed Aug. 28, 1905. Serial No. 276,105.



Claim.—1. In an electric circuit-controller, the combination with a revoluble display element, of a hammer, a trigger to release the hammer, said trigger projecting into the path of the revoluble display element for operation thereby, and a spring for returning the trigger to its normal position.

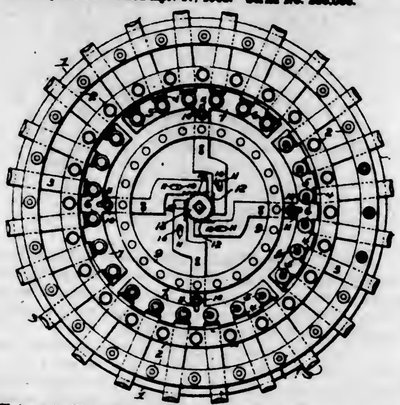
2. In an electric circuit-controller, the combination with a revoluble display element, of a hammer, a trigger to release the hammer, said trigger projecting into the path of the revoluble display element for operation thereby, a spring for returning the trigger to its normal position, said spring being adjustable.

3. In an electric circuit-controller, the combination with a revoluble display element, of a hammer, a trigger to release the hammer, said trigger projecting into the path of the revoluble display element for operation thereby, a spring for returning the trigger to its normal position, said spring being adjustable, and a stop for limiting the movement of the trigger.

center of the door and links connecting said rotary member with said arms.

3. The combination with a circular door, parallel fixed rings thereon, and a series of radially-disposed bolts mounted in said fixed rings, of a series of segments located between the rings and between the bolts and door, pins on the bolts engaging in openings in the segments, inwardly-projecting arms on the segments, a rotary disk at the center of the door, and links connecting said disk with the arms.

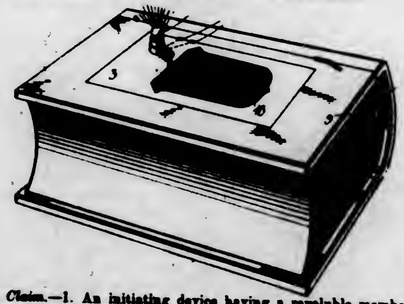
811,701. **BOLTWORK FOR CIRCULAR DOORS.** JOSEPH B. CAMBELL, New York, N. Y., assignor to Remington and Sherman Company, Philadelphia, Pa. Filed Apr. 17, 1905. Serial No. 256,006.



Claim.—1. The combination with a circular door and a series of radially-disposed bolts thereon, of a series of radially-movable segments, each segment movably connected with a number of bolts, arms on the segments provided with racks, and a single pinion meshing with the racks of all the arms to move them radially.

2. The combination with a circular door, parallel fixed rings thereon, and a series of radially-disposed bolts movable in said fixed rings, a series of segments inside the inner ring, removable heads on the inner ends of the bolts movably connected with the segments, arms on the segments provided with racks, and an operating-pinion engaging all the racks.

811,702. **INITIATING APPARATUS.** LEWIS D. COOK, Mount Holly Springs, Pa. Filed Apr. 10, 1905. Serial No. 254,891.

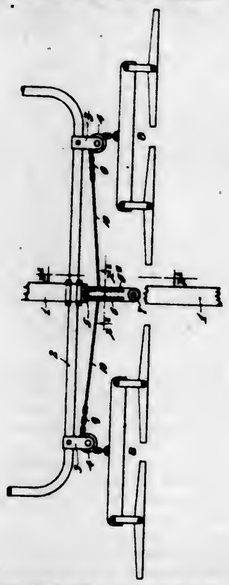


Claim.—1. An initiating device having a revoluble member, means to revolve the same, means to lock and predetermine the extent of the revolution thereof, electric lamps on opposite sides of said revoluble member, successively displayed by the rotation thereof, a source of energy, and connections including the same and the said lamps.

2. An initiating device having a revoluble member, means to lock and predetermine the extent of the revolution thereof, electric lamps on opposite sides of said revoluble member, a source of energy and connections to successively include the respective lamps in circuit with the source of energy as the revoluble member rotates.

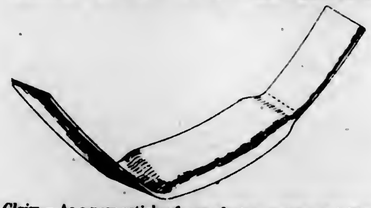
3. In apparatus of the class described, the combination of a revoluble display element, and a firing mechanism including a hammer, and a trigger to release the hammer, said trigger projecting into the path of the revoluble display element for operation thereby.

811,703. **DRAFT-EQUALIZER.** SYDNEY B. DAVIS, Minneapolis, Minn. Filed Feb. 7, 1905. Serial No. 244,534.



Claim.—In a machine of the character described, the combination with a pole and a frame having a transversely-extended front bar 2 rigidly secured to said pole, of an equalizing-lever 6 pivoted to said pole with its free end turned rearward and terminating slightly forward of said bar 2, said lever having two parallel rows of perforations, the sheave-bearings 3 secured to said frame-bar 2 on opposite sides of the pole, the sheaves 4 mounted on said sheave-bearings 3, the rods 10 adjustably engaged with the perforations of said equalizing-lever 6, and the chains 9 attached to the outer ends with devices to which horses may be hitched, substantially as described.

811,704. **CATAMENIAL BANDAGE.** EDWARD S. DIX, New York, N. Y., assignor to The Borated Spontaky Company, Brooklyn, N. Y., a Corporation of New York. Filed Oct. 16, 1903. Serial No. 177,230.



Claim.—As a new article of manufacture a catamenial bandage comprising a knitted tube, absorbent material therein, a non-elastic woven strip, substantially of the width of the said tube when flattened, embedded in said cotton, transverse stitching attaching said strip at its ends to said tube, the ends of said tube extending beyond said woven strip and forming means for attachment.

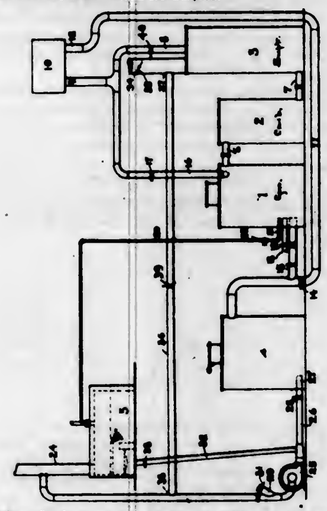
811,705. **WATCH-PENDANT ATTACHMENT.** CARP D. HATCH, Allen, Mich. Filed Apr. 21, 1905. Serial No. 256,760.

Claim.—1. The combination with a pendant, of a crown, a disk mounted for longitudinal movement therein and held against rotation relatively thereto, and a cone-shaped coiled spring housed within the crown and bearing against the disk.

2. The combination with a pendant, of a crown having a stud provided with a longitudinal slot, a disk having a tent to engage the slot, and a spring housed within the crown and bearing against the disk.

3. The combination with a pendant, of a crown having a stud provided with a longitudinal slot, a disk having a tent to engage the slot, and a cone-shaped coiled spring housed within the crown and bearing against the disk.

811,706. **APPARATUS FOR GENERATING GAS.** BYRON E. BLOOD and CARLETON ELLIS, New York, N. Y., assignors to Combustion Utilities Company, New York, N. Y., a Corporation of New York. Filed Feb. 21, 1905. Serial No. 246,788.



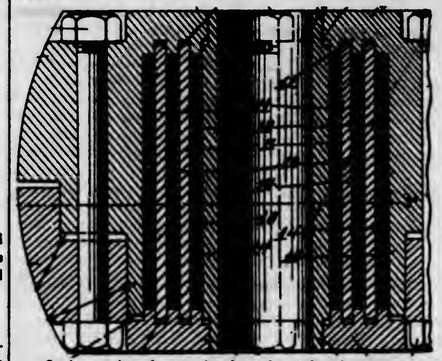
Claim.—1. Apparatus for generating illuminating-gas consisting of a water-gas generator and carburetor, a gas-producer, means for supplying carbon dioxid and air to said gas-producer, means for regulating the relative amounts of the carbon dioxid and air, and means for mixing the water-gas and producer-gas in predetermined amount.

2. Apparatus for generating illuminating-gas consisting of a water-gas generator and carburetor, a gas-producer, a steam-boiler furnace, means for supplying carbon dioxid from said steam-boiler, and air to said gas-producer, means for regulating the relative amounts of the carbon dioxid and air, and means for mixing the water-gas and producer-gas in predetermined amount.

3. Apparatus for generating illuminating-gas consisting of a water-gas generator and carburetor, a gas-producer, means for supplying the products of combustion to the air-blow and air to said gas-producer, means for regulating the relative amounts of the carbon dioxid and air, and means for mixing the water-gas and producer-gas in predetermined amount.

811,707. **CYLINDER FOR TREATING HEATED METAL.** JOHN P. BLAIR, Torrington, Conn., assignor to The Coe Brass Manufacturing Company, a Corporation of Connecticut. Filed May 6, 1905. Serial No. 259,247.

Claim.—1. A container for treating heated metal under pressure comprising a series of concentrically-disposed cylinders, and a filling of non-heat-conducting material interposed between the cylinders, the outer cylinder of said series being formed of telescoping sections.



2. A container for treating heated metal under pressure comprising a series of concentrically-disposed cylinders, and a filling of non-heat-conducting material interposed between the cylinders, the outer cylinder of said series being formed of adjustable telescoping sections shaped to engage and compress said filling.

3. A container for treating heated metal under pressure comprising a series of concentrically-disposed cylinders, and a filling of non-heat-conducting material interposed between the cylinders, the outer cylinder of said series being formed of telescoping sections recessed to serve as an inclosing jacket for the other cylinders.

4. A container for treating heated metal under pressure comprising a cylinder, a covering therefor consisting of alternate layers of pressure and heat resisting material, and a sectional inclosing jacket for the covering having inwardly-extending flanges encircling the cylinder, the sections of said jacket being movable relatively to each other to exert pressure upon the layers of heat-resisting material.

5. A container for treating heated metal under pressure comprising a cylinder, a covering therefor consisting of alternate layers of pressure and heat resisting material, a sectional inclosing jacket for the covering having flanges encircling the cylinder at its ends, and means for giving said sections movement relatively to each other.

6. A container for treating heated metal under pressure comprising a cylinder, a sectional jacket therefor, the sections of the jacket being movable relatively to each other and having flanges arranged to close the ends of an annular chamber formed between the cylinder and its jacket, and a suitable filling for the chamber.

7. A container for treating heated metal under pressure comprising a series of pressure-resisting cylinders concentrically arranged, a suitable filling interposed between the cylinders, and a two-part inclosing jacket, the members of said jacket being movable relatively to each other and having integral portions shaped to encircle the cylinder at its ends and exert pressure in opposite directions upon the filling.

8. A container for treating heated metal under pressure comprising a series of cylinders arranged one within the other, and an inclosing jacket formed in sections and each section provided with an integral flange shaped to interlock with the inner cylinder of said series and having annular recesses therein to receive the ends of the outer cylinders.

9. A cylinder for treating heated metal under pressure comprising a series of concentrically-disposed cylinders varying in length and thickness, and a filling of non-heat-conducting material interposed between the cylinders, the outer cylinder of said series being formed of telescoping sections bolted together and each section provided with a head recessed to receive the ends of the other cylinders.

10. A container for treating heated metal under pressure comprising a series of pressure and heat resisting cylinders concentrically arranged in alternating relation, and a sectional inclosing jacket therefor, the sections of said jacket being provided with flanges having annular ribs extending between the pressure-resisting cylinders and exerting pressure upon the heat-resisting cylinders interposed between the same.

11. A container for treating heated metal under pressure comprising a cylinder, a covering for the cylinder consisting of a series of cylinders arranged concentrically with said first-named cylinder, non-conducting material interposed between said concentric cylin-

ders, a two-part telescoping jacket inclosing the covering

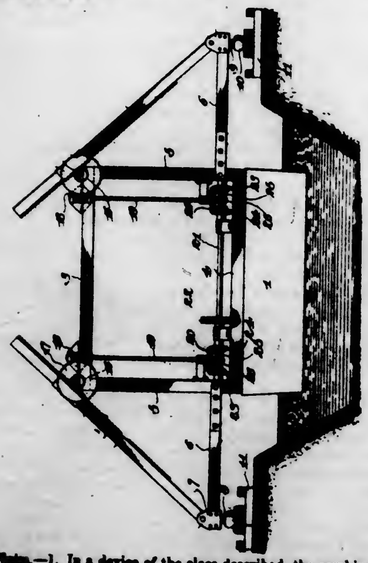
ders, a two-part telescoping jacket inclosing the covering, and means for moving the parts of the inclosing jacket relatively to each other.

811,708. BALL-BEARING. SAMUEL S. BYERLEY, Philadelphia, Pa. Filed Sept. 21, 1905. Serial No. 279,405.

Claim.—1. A bearing comprising the combination of concentric rings whereof one is grooved on its inner and whereof the other is grooved on its outer face, balls interposed between said rings and arranged in said grooves, and a cage comprising a crown-toothed ring having between its teeth countersinks and having the ends of its teeth enlarged and provided with concave faces to permit of the insertion of balls and having the shanks of the teeth inclined to form with said countersinks and the enlarged heads ball-sockets, substantially as described.

2. A bearing comprising the combination of concentric rings whereof one is grooved on its inner and whereof the other is grooved on its outer face, balls interposed between said rings and arranged in said grooves, and a cage comprising a crown-toothed ring having between its teeth ball-seats and having the ends of its teeth enlarged and provided with passages to permit of the insertion of balls and having the shanks of the teeth arranged to form with said ball-seats and the enlarged heads ball-sockets, substantially as described.

811,709. JACK FOR STRAM-DREDGES, &c. JAMES G. FAIRBANKS and GEORGE L. SAUER, Marion, Ohio. Filed Nov. 19, 1903. Serial No. 181,575.



Claim.—1. In a device of the class described, the combination with a body, of a supporting element pivotally connected with and projecting from said body, a bearing member carried by the element, an operating member connected with said element and provided with a rack, and means for actuating said operating member, said means comprising a rotary pinion in mesh with the rack, a drive-shaft, means for operating the latter, and operative connections between the drive-shaft and pinion for actuating the latter.

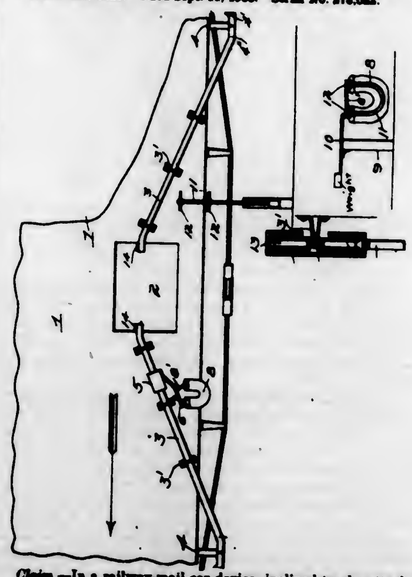
2. In a device of the class described, the combination with a body, of a supporting element pivotally connected with and projecting from said body, a bearing member carried by the element, an operating member connected with said element and provided with a rack, and means for actuating said operating member, said means comprising a counter-shaft, a pinion thereon in mesh with the rack, a drive-shaft, means for operating the same, and mechanism actuated by the drive-shaft for driving the counter-shaft.

3. In a device of the class described, the combination with a body, of a supporting element pivotally connected with and projecting from said body, a bearing member carried by the element, an operating member connected with said element and provided with a rack, and means for actuating said operating member, said means comprising a counter-shaft, a pinion fixed thereon in mesh with the rack, a worm-wheel fixed on the counter-shaft, a drive-shaft, means for operating the same, and a worm-shaft operated by the drive-shaft and provided with a worm engaging the worm-wheel for driving the counter-shaft.

4. In a device of the class described, the combination with a body, of a supporting element pivotally connected with and projecting from said body, a bearing member carried by the element, an operating member connected with said element and provided with a rack, and means for actuating said operating member, said means comprising a counter-shaft, a pinion fixed thereon and in mesh with the rack, a worm-wheel fixed on the counter-shaft, a worm-shaft having a worm engaging the latter wheel for operating the counter-shaft, a gear fixed on the worm-shaft, a drive-shaft, means for operating the same, a pair of idle pinions on the drive-shaft in mesh with said gear, and a clutch member capable of engaging either pinion to reversely rotate the worm-shaft or for releasing both pinions to lock the latter shaft.

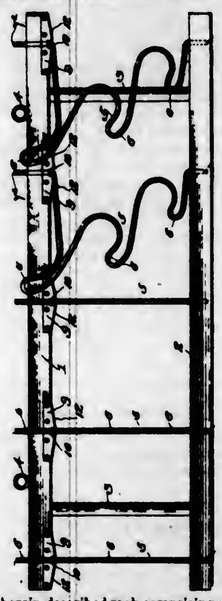
5. The combination with a body, of a tension-bar pivotally connected to the body, an obliquely-disposed spud pivotally connected to the outer end of the tension-bar, a guiding means for said spud, and means for positively feeding said spud longitudinally through said guide.

811,710. RAILWAY-MAIL-BAG DEVICE. CHESTER A. GARBER, Brookville, Ohio. Filed Sept. 11, 1905. Serial No. 278,022.



Claim.—In a railway-mail-car device, inclined tracks attached to a side of the car and projecting into the car, the lower ends of said tracks terminating horizontally, means for supporting said tracks away from the side of the car, a carrier movable on each of said tracks, said carrier having an arm with a hook thereon, in combination with a crane upon which the mail-bags are supported in a position to be engaged by said arm and removed from the crane, said crane having reversible pins upon which the mail-bags are suspended, substantially as shown and described.

811,711. HAT AND COAT RACK. ALVAH W. GOSS, Zanesville, Ohio. Filed May 9, 1905. Serial No. 259,893.



Claim.—The herein-described rack comprising a pair of horizontally-disposed, parallel supporting-bars spaced apart by cross-bars 3, resilient hooks 5 pivotally mounted at their ends between said supporting-bars, said hooks being constructed and mounted to swing from a position at right angles to said supporting-bars to an inoperative position flat against the same, holding-plates 9 secured to the upper supporting-bar, the lower edge of said plates being inclined downwardly from their ends to the center and provided with a notch with which said hooks are adapted to spring into engagement, thereby locking the same in operative position, and finger-pieces 7 formed on the upper pivoted ends of said hooks, said finger-pieces passing through the upper supporting-bar to enable said hooks to be swung to an inoperative position, substantially as described.

811,712. ADJUSTABLE STAND FOR FLOWER-POTS. ADOLPH GRAEFE, Brooklyn, N. Y. Filed July 25, 1905. Serial No. 271,186.

Claim.—1. An adjustable support of the class described, comprising a base, a standard projecting from the base and having a cylindrical bore, a cylindrical stem adjustable within said bore and having a series of circumferential shoulders or projections, means carried by the standard for engaging said shoulders, and a table or platform carried by the stem.

2. An adjustable support of the class described, comprising a base, a standard projecting therefrom and having a cylindrical bore, a cylindrical stem adjustable within said bore and having a series of circumferential shoulders or projections and a circumferential tapered or beveled surface intermediate between said shoulders and leading thereto, a pawl mechanism carried by the standard and projecting into operative engagement with said shoulders and tapered surface, and a table or platform carried by the stem.

3. An adjustable support of the class described, comprising a base, a tubular standard having a separable detachable connection with the base, a stem adjustable within said detachable standard and separable therefrom, means carried by the standard for engaging the stem, and a table or platform separably and detachably connected to the stem.

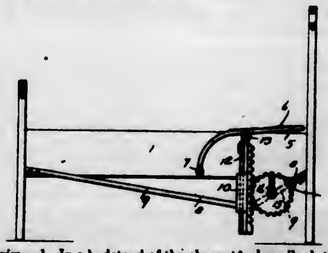
4. An adjustable support of the class described, comprising a base, a tubular cylindrical standard detachably connected with the base, a cylindrical stem adjustable in the cylindrical bore of the tubular standard and separable from the latter, said stem having a circumferential series of projecting shoulders, means carried by the standard for engaging said shoulders, and a table or platform detachably carried by the stem.

5. An adjustable support of the class described, comprising a base, a tubular cylindrical standard detachably connected with said base, a cylindrical stem adjustable in the corresponding bore of the tubular standard and separable from the latter, said stem having a series of circumferential shoulders and a circumferential tapered or beveled surface intermediate between the shoulders and leading thereto, a pawl mechanism carried by the standard and operatively engaging said shoulders and tapered surface, and a table or platform detachably carried by the stem.

6. An adjustable support of the class described, comprising a supporting-base, a standard projecting from the base and having a cylindrical bore, a revolving stem adjustable within said bore and having a vertical series of shoulders or projections circumferentially extending around said stem, means carried by the standard for engaging said cylindrical shoulders or projections at any point of the revolving movement of the stem, and a table or platform carried by the stem.

7. An adjustable support of the class described, comprising a supporting-base, a standard having a cylindrical bore and a separable detachable connection with said base, a revolving stem adjustable within said bore and separable from the standard and having a vertical series of shoulders or projections circumferentially extending aroud said stem, means carried by the standard for engaging said cylindrical shoulders or projections at any point of the revolving movement of the stem, and a table or platform separably and detachably connected to the stem.

811,713. INVALID-BEDSTEAD. LOUIS J. GROSJEAN, Chicago, Ill. Filed July 10, 1905. Serial No. 269,084.



Claim.—1. In a bedstead of the character described, the combination with a supporting-frame, of a back-prop frame hingedly connected to said supporting-frame, a gear-frame arranged below said supporting-frame, vertically-disposed guide-bars arranged on said supporting and gear frames, rack-bars slidably mounted in said guide-frames, guide-rollers mounted on the upper end of said rack-bars, and means whereby said rack-bars are operated to raise and support said rack-frames, and said back-prop frame, substantially as described.

2. In a bedstead of the character described, the combination with a supporting-frame, of a back-prop frame hingedly connected to said supporting-frame, a gear-frame arranged below said supporting-frame, vertically-disposed channeled guide-bars arranged on said supporting and gear frames, rack-bars slidably mounted in said channeled guide-bars, means formed on said rack-bars to retain

the same in engagement with said rack-bar frames, grooved guide-rollers mounted on said rack-bars to engage the side bars of said back-stop frame, a transversely-disposed shaft journaled in said gear-frame, gear-wheels fixed on said shaft to engage said racks, a pawl to engage said gear-wheels and to hold the same against retrograde movement, and a crank-handle arranged on said shaft, substantially as described.

811,714. **FASTENING FOR HORSE-COLLARS.** PIERRE GUINDOLLET, St. Amand, France. Filed June 17, 1904. Serial No. 213,063.

Claim.—1. A fastener for horse-collars composed of two metal plates, one of which called male part having a tongue-piece, the said male part being provided with a recess for the lever and with an opening for the lower beak or catch of the lever the female part being provided with a cavity for the tongue-piece and having a lever terminating in a projection device, a spiral spring mounted on a fixed rod, and a lower beak or catch of the lever.

2. A fastening for horse-collars composed of two metal plates one of which called male part having a tongue-piece which penetrates in a corresponding recess of the female part and raises the lever of this part, the said male part being provided with a corresponding recess for the lever, and with an opening corresponding to the lower beak or catch of the lever, the other called female part being provided with a cavity corresponding to the tongue-piece of the male part and having a lever entering the recesses of the male part, a spiral spring operating the lever and a lower beak or catch adapted to engage in the corresponding opening of the tongue-piece of the male part, substantially as herein described and set forth.

811,715. **GUN-SHIELD.** ROBERT A. HADFIELD and ALEXANDER G. M. JACK, Sheffield, England. Filed Apr. 19, 1905. Serial No. 256,282.

Claim.—1. A cast-steel gun-shield comprising an inclined and transversely-convex central front portion and curved or sloping extensions at the sides and top thereof and integral therewith forming the sides and roof, respectively, of the shield and presenting a smooth external surface, the front portion having an upright, elongated gun-aperture formed therein.

2. A cast-steel gun-shield having its front portion, roof and sides integral and externally convexed, the front portion having a gun-aperture formed therein and reinforced around its edges.

3. A cast-steel gun-shield comprising a rearwardly-inclined and transversely-convex central front portion of maximum thickness and provided with a gun-aperture, and curved sides and a roof integral with said front portion and gradually decreasing in thickness therefrom.

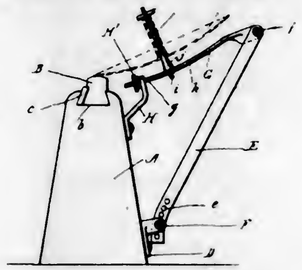
4. A partly-spherical cast-steel gun-shield comprising an apertured central front portion and integral extensions thereof forming the roof and sides of the shield, and an integral reinforce along the rear edge of the shield.

5. A one-piece cast-steel gun-shield of partly-spherical or dished shape, with roof and sides integral with and curved or sloping from the central front portion, and presenting a smooth external surface, a slot or window-like aperture for a gun being formed in said front portion.

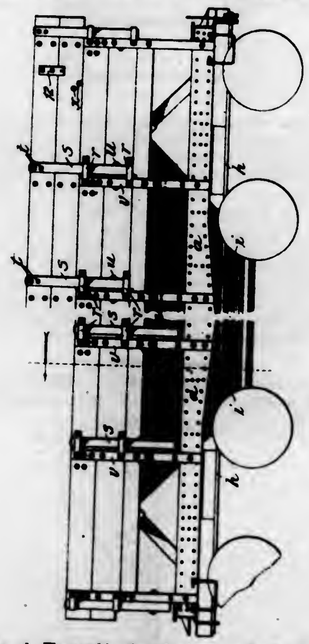
6. A one-piece cast-steel gun-shield of partly-spherical or dished shape, having an apertured, inclined central front portion of maximum thickness from the base upward and curved or sloping extensions integral therewith constituting the roof and sides and gradually decreasing in thickness toward the open rear end of the shield.

811,716. **MACHINE FOR SHARPENING DISKS.** WILLIAM F. HARVEY, Dunlin, Kans. Filed Feb. 2, 1905. Serial No. 243,570.

Claim.—The combination, with an anvil, and upper and lower brackets H and D secured thereto; of a main arm having its lower end pivoted to the lower bracket D and having its upper end arranged above the level of the top of the anvil, a brace-arm pivoted at one end to the upper end of the said main arm and having its other end slidable in the upper bracket H and provided with a nut, and a pin projecting from the middle part of the said brace-arm and adapted to support the disks with their concave sides uppermost.



811,717. **DUMP-CAR.** HARRY S. HART and WINFIELD YOST, Chicago, Ill., assignors to Rodger Ballast Car Company, Chicago, Ill., a Corporation of Illinois. Filed Feb. 13, 1905. Serial No. 245,461.



Claim.—1. The combination of a dump-car having the usual inclined sides and ends and vertically-arranged sides above the inclined sides having folding upper sections, and extension ends in the same plane as the inclined ends having a swinging and a removable section.

2. In a car of the class described, the combination of a supporting-frame portion, a V-shaped hopper-bottom secured thereto and extending longitudinally thereof, vertical side portions attached to the supporting-framework of the car and extending upwardly therefrom and formed of lower stationary and upper foldable sections, stakes for holding said side portions in their extended position, and inclined end portions arranged at each end of the car between the stationary and foldable side boards and formed of a plurality of sections, one of which is pivotally and the other removably secured in position so that they may be extended or collapsed, and means for operatively holding the parts in extended and collapsed positions, substantially as described.

3. In a car of the class described, the combination of a supporting-frame portion, a V-shaped hopper portion secured thereto extending longitudinally thereof and depending therefrom, vertically-arranged side boards secured to the framework of the car and extending upwardly therefrom above the V-shaped portion of the hopper and formed of a lower stationary portion and an upper inwardly-foldable portion, stakes exteriorly arranged for holding the parts in extended position, inclined end boards arranged between the stationary and foldable portions of the side boards and provided with a lower swinging section and an upper removable section arranged to be extended or collapsed, and means for operatively holding the parts in their extended or collapsed position, substantially as described.

4. In a car of the class described, the combination of a supporting-frame portion, a V-shaped hopper portion secured thereto extending longitudinally thereof and depending therefrom, vertically-arranged side boards secured to the supporting-frame and extending above the V-shaped hopper-bottom comprising lower fixed and upper swinging sections arranged to swing inwardly and downwardly in parallel engagement with the fixed sections, inclined end boards arranged at each end of the car and formed of lower outwardly and downwardly swinging sections and upper sections removably secured in position so as to be arranged between the swinging side-board portions when in their extended and folded conditions, and means for securing the parts in their extended and folded positions, substantially as described.

5. In a car of the class described, the combination of a supporting-frame portion, a V-shaped hopper portion secured thereto extending longitudinally thereof and depending therefrom, vertically-arranged side boards secured to the supporting-frame and extending above the V-shaped hopper-bottom comprising lower fixed and upper swinging sections arranged to swing inwardly and downwardly in parallel engagement with the fixed sections, inclined end boards arranged at each end of the car and formed of lower outwardly and downwardly swinging sections and upper sections removably secured in position so as to be arranged between the swinging side-board portions when in their extended and folded conditions, means for securing the parts in their extended and folded positions, and removable filler portions arranged between the removable inclined end-board sections and the upper swinging sections of the side boards when the parts are in their extended positions, substantially as described.

6. In a car of the class described, the combination of a supporting-frame portion, a V-shaped hopper-bottom secured thereto and extending longitudinally of the car with its apex arranged near the longitudinal center thereof, vertical side portions attached to the supporting-framework of the car and extending upwardly therefrom formed of lower stationary and upper foldable sections, inclined end portions formed of a removable portion extending from one fixed hopper side portion to the other and an upper removable portion extending from one foldable side portion to the other and removably secured thereto, and means for holding said side portions in extended condition, substantially as described.

7. In a car of the class described, the combination of a supporting-frame portion provided with a dumping-bottom, side portions attached to the supporting-framework of the car formed of lower fixed and upper foldable portions, inclined end portions having movable portions and lower fixed portions extending from one fixed side frame portion to the other, and upper removable end frame portions extending from one foldable side frame portion to the other and removably secured thereto.

8. In a car of the class described, the combination of a supporting-frame portion provided with a dumping-bottom, side portions attached to the supporting-framework of the car formed of lower fixed and upper foldable portions, inclined end frame portions having movable portions extending from one fixed side frame portion to the other, and inclined upper end frame portions extending from one foldable side frame portion to the other and adapted to be removably secured thereto when such foldable side frame portions are in raised and lowered positions respectively.

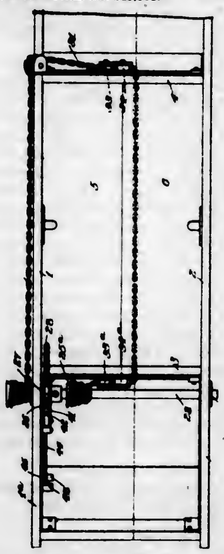
9. In a car of the class described, the combination of a supporting-frame provided with a dumping-bottom, side portions attached to the supporting-framework of the car formed of lower fixed and upper foldable portions, end frame portions each having a movable portion extending from one fixed side portion to the other and an upper removable portion extending from one foldable side portion to the other, and means for holding each side and end frame portions in position.

811,718. **HOOF MIXTURE.** FRANK B. HATCH, Winnipeg, Canada. Filed June 10, 1905. Serial No. 265,049.

Claim.—1. The herein-described hoof mixture consisting of water, saltpeter, sal-ammoniac, sulfate of copper and strong ammonia substantially as described and for the purpose specified.

2. The herein-described hoof mixture consisting of water, one quart, saltpeter one ounce or thereabout, sal-ammoniac one ounce or thereabout, strong ammonia one-half dram or thereabout, sulfate of copper one-half dram or thereabout substantially as described and for the purpose specified.

811,719. **DUMPING-WAGON.** JOHN HEBERLING, Rochester, N. Y. Filed Mar. 6, 1905. Serial No. 248,378.



Claim.—1. In a dump-wagon, the combination with a box, a movable bottom door thereon and a winding-shaft, extending transversely of the box at one end thereof, of projections on the ends of the door and similar projections on each end of the box, a flexible connection attached at each of its ends to the shaft and passing first beneath the projection at one end of the door thence over the projection on the adjacent end of the box, thence passing over the projection at the other end of the box and beneath the other projection on the door and means for operating the shaft.

2. In a dump-wagon, the combination with a box, movable bottom doors thereon and a winding-shaft extending transversely of the box at one end thereof, of projections on the ends of one of the doors and similar projections on the ends of the box, a flexible connection having its end portions passing beneath said door projections and over those at each end of the box, the intermediate portion of said connection passing beneath the other door and having its two extremities connected to the winding-shaft and means for operating the latter.

3. In a dump-wagon, the combination with a box, movable bottom doors thereon one of which is provided with end projections and a winding-shaft extending transversely of the box at one end thereof, of projections on each end of the box, a chain extending beneath and over the respective projections at the end of the door and box which are adjacent the shaft, thence passing beneath the other door and over and under the projections arranged respectively on the other end of the box and door, the two extremities of the chain extending upwardly from the door projections and being secured to the winding-shaft and means for operating the latter.

4. In a dump-wagon, the combination with a box, a movable bottom thereon and a winding-shaft extending transversely thereof and having an end projecting beyond a side of the box, of projections on the ends of the box, a flexible connection having one end attached to the projecting end of the shaft and extending along one side of the box, thence beneath the bottom and connected at its other extremity to the shaft between the sides of the box.

5. In a dump-wagon, the combination with a box, a movable bottom thereon, a winding-shaft extending transversely thereof at one end of the box and having an end projecting beyond one side thereof and a guide-pulley located at the other end of the box, of a flexible connection attached at one end to the shaft between the box sides and at the other end to the projecting end of the shaft and extending beneath the box and along the side thereof and passing over the guide-pulley thereon.

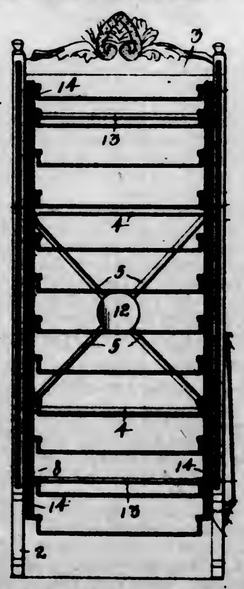
6. In a dump-wagon, the combination with a box, a movable bottom thereon, a winding-shaft and a flexible connection between it and the bottom, of a ratchet-wheel on the shaft, a locking-pawl coöperating therewith, a lever pivoted on the box, connections between it and said pawl for operating the latter in one direction to disengage it when the lever is moved in one direction and releasing it when said lever is moved in the opposite direction, means for actuating the pawl into operative position independently of the lever and means for rotating the shaft.

7. In a dump-wagon, the combination with a box, a movable bottom thereon, a winding-shaft and a flexible connection between it and the bottom, of a ratchet-wheel on the shaft, a locking-pawl coöperating therewith and means for normally holding it in operative position, a pivoted foot-operated releasing-arm, connections between said arm and the pawl operating only to disengage the pawl from the ratchet-wheel when the arm is moved in one direction and means coöperating with the ratchet-wheel for rotating the shaft.

8. In a dump-wagon, the combination with a box having an end, a movable bottom for the box, a winding-shaft extending transversely of the box adjacent the end thereof and a flexible connection between it and the bottom, of a ratchet-wheel on the shaft, a pivoted operating-lever engaging the end of the wagon-box to limit its movement in one direction, a thrust-pawl on the lever coöperating with the ratchet-wheel when the lever is moved away from the end of the box, said pawl having an end adapted to engage the end of the box to move it into inoperative position when the movement of the lever is arrested.

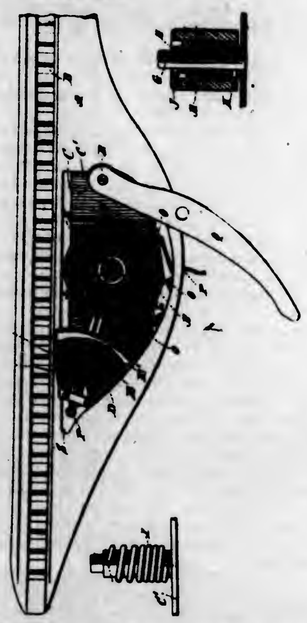
9. In a dump-wagon, the combination with a box, comprising sides and ends, of movable bottom-sections on the box, upwardly-extending flanges on the bottom-sections embracing the outer faces of the box sides and hinge members supporting the ends of the bottom-sections on the box having corner-pieces supporting said flanges.

811,720. **DISPLAY-RACK.** CHARLES G. HEDGE, Manchester, Ohio. Filed June 13, 1905. Serial No. 264,896.



Claim.—In a display-rack, the combination with a supporting-frame comprising upright parallel side bars, a cross-bar connecting the upper ends of said side bars, diagonally and horizontally disposed brace-bars, castings secured to said side bars, said castings having formed therein threaded sockets to receive the threaded outer ends of said brace-bars, a centrally-disposed casting having threaded sockets formed therein to receive the threaded inner ends of said diagonal brace-bars, and endless conveyer mechanism arranged on said supporting-frame, display-shelves carried by said mechanism, and means to pivotally connect said shelves with said conveyer mechanism whereby the former will always assume a horizontal position while being carried around by said conveyer mechanism, substantially as described.

811,721. **SHUTTLE.** EDUARD HERING, West Hoboken, N. J. Filed June 21, 1905. Serial No. 266,196.



Claim.—1. In a shuttle, a support, a coil-spring arranged around said support, and a spool adapted to be carried by said support and provided with a pin arranged to engage said coil-spring to lock the spool to the support.

2. In a shuttle, a support, a spool adapted to be carried by said support, and a resilient member for locking said spool to the support.

3. In a shuttle, a support, a spool adapted to be carried by said support, and provided with locking means, and a coil-spring engaging said locking means for locking said spool to the support.

4. In a shuttle, a support, a sleeve on said support, a coil-spring around said sleeve, a spool adapted to be carried by said support, and a projection on said spool arranged to engage said coil-spring to lock the spool to the support.

5. In a shuttle, a support, a coil-spring around said support, the coils of said spring becoming wider apart as they near the free end of the support, a spool, arranged to be slipped over the free end of said support and provided with a projection adapted to enter into engagement with the coil-spring at the point where the coils are widest apart, to lock the spool to the support.

811,722. **DRILL-CHUCK.** FRITZ J. HOMMEDIEU, Detroit, Mich., assignor to National Twist Drill & Tool Company, Detroit, Mich., a Corporation of Michigan. Filed Mar. 7, 1904. Serial No. 197,691.

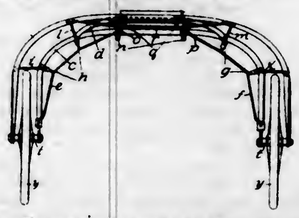
Claim.—1. In a drill-chuck, the combination with a shank member having a longitudinal split and chambered cylindrical head portion formed with an inclined outer edge, a bushing member having a

longitudinal slit therein and a tapered head, and a sleeve having a threaded engagement with the head and formed with a tapered outer end portion adapted to simultaneously engage the respective tapered ends of the shank and bushing.

2. In a drill-chuck, the combination with an expansible chambered head, of a compression-sleeve having a threaded engagement with the head, and a tapered end portion engaging the forward edge of the head, and a bushing within the head provided with a tapered portion at its forward edge adapted to engage the tapered parts of the sleeve.

3. The combination of a main chuck consisting of a shank, longitudinally-slitted head and an exterior sleeve having a screw-threaded engagement with the head for contracting the members of the head, of a split reducing-bushing adapted to fit the head, a bearing on the bushing adapted to be engaged by said sleeve, whereby the sleeve on the outside of the main chuck will contract and directly compress the jaws of the bushing when the sleeve is moved rearward.

811,723. **PNEUMATIC SULKY.** SAMUEL B. JERALD, Waterloo, Iowa. Filed Apr. 26, 1905. Serial No. 257,427.



Claim.—The combination, with the wheels, seat and thills of a pneumatic sulky, of an arch consisting of three curved members, the upper members arranged at angles one in front of and the other behind the lower member, and each approximately parallel to the lower member, and with their ends meeting to support the outer ends of the wheel-spindles, bracing connecting the inner member to the outer members, a reinforcing-arch superposed upon said inner member, and suitable trusses for supporting the middle sections of said outer arches.

811,724. **CROCHET-WORK BUTTON.** IRENE KALLIWODA, Sopron, Austria-Hungary. Filed June 28, 1904. Serial No. 214,490.

Claim.—1. A button of the kind described, made of a center part formed of long stitches (trebles), and long double crochets worked into said stitches, substantially as described.

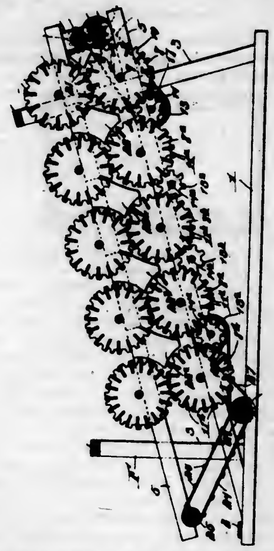
2. A button of the character described, made of pairs of long stitches (trebles) and long double crochets of chain-stitches worked between said long stitches and said crochets, substantially as described.

3. A crochet-work button, made of a center part, an outer annular part formed into a row of tambour-stitches worked over with close stitches (*a*), a row of tambour-stitches of single thread and another row of double thread worked around the first row, substantially as described.

811,725. **MEANS FOR SOLDERING ALUMINIUM.** ARTHUR W. KING, London, England, assignor to Charles Rogers, London, England. Filed Aug. 15, 1905. Serial No. 273,976.

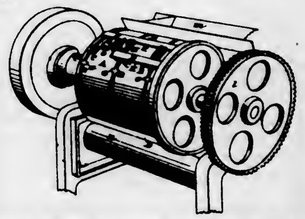
Claim.—A coating whereby ordinary solder can be used to solder aluminium, which is obtained by melting together to a low red heat and well mixing ten parts soft solder composed of tin and lead of the character specified, five parts of pure zinc and five to eight parts of aluminium.

811,726. **HEMP-BREAKING MACHINE.** WILLIAM H. KLARK and JAMES P. LOWRY, Winchester, Ky. Filed Nov. 4, 1903. Serial No. 179,854.



Claim.—A hemp-breaking machine embodying a plurality of pairs of breakers, driving-gears meshing with the lower series of breakers and having their journals disposed below those of the said breakers whereby the lower breakers may be closely disposed thereby to prevent any tendency of the gears to catch and mutilate the hemp, inward-curved angularly-arranged guide members having pointed terminals disposed between the succeeding pairs of breakers, and an endless conveyer arranged at the lower end of the machine and disposed at an angle oblique to the plane of the travel of the hemp therethrough, the lower end of the conveyer being arranged below the lowest breaker, whereby the hemp discharged from this breaker is caused to be caught by the conveyer.

811,727. **ADJUSTABLE CURVED TYPE AND CYLINDER.** HENRY L. KOEHLER, Deer Park, Ky. Filed Oct. 19, 1904. Serial No. 229,065.



Claim.—1. The combination of a revoluble cylinder encircled by mortises, flanged strips having dovetails fitting loosely in the mortises, curved type having flanges adapted to slide between the cylinder and the flanges on the strips, means for fastening the strips to the cylinder and means for securing the type between the strips all as and for the purposes set forth.

2. The combination of a revoluble cylinder encircled by mortises, flanged strips having dovetails fitting loosely in the mortises, circularly-curved type having flanges adapted to slide between the cylinder and the flanges on the strips, screws passing through the dovetails for fastening the strips to the cylinder, and plates and screws for securing the type between the strips all as and for the purposes set forth.

3. The combination of a revoluble cylinder, adjustable flanged strips, extending along said cylinder, adapted to freely slide around said cylinder and to be firmly attached thereto at any point thereon,

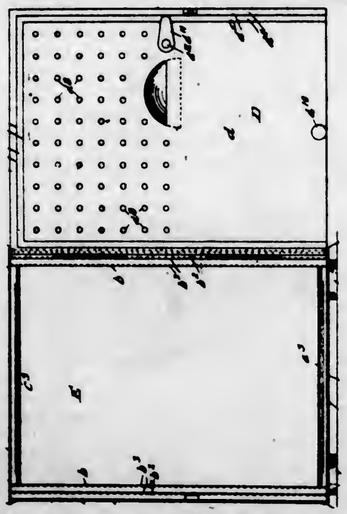
curved flanged type adapted to be secured between a pair of such stripe, and means for firmly attaching said stripe to the cylinder at any point, substantially as described.

811,728. SHEET-METAL RECEPTACLE. DAVID R. LEVIN and GABRIEL B. SUNDSTROM, Chicago, Ill.; said Sundstrom assignor to said Levin. Filed Jan. 30, 1905. Serial No. 243,330.

Claim.—1. In a sheet-metal receptacle, the combination of a body having side walls, and a head fitting within the body near one end, said head having at its edge a flange disposed at an acute angle both to the head and the adjacent part of the side walls and extending toward the adjacent end of the walls of said body, said walls being curled inwardly around said flange and having an edge bearing endwise into the inner apex of the angle between said flange and head, and said flange bearing endwise against the inner surface of said curled part, said curled part having contact with said flange only along the line of the edge of said flange and along the line of the apex of the angle between said flange and head.

2. A sheet-metal receptacle, comprising side walls and a head fitting within said walls near one end, said head having at its edge a flange disposed at an angle to the head and extending toward the adjacent end of the side walls, said walls being curled inwardly around said flange, and the curled part of said walls having its edge forced endwise into the inner apex of the angle between said flange and head so as to bear abruptly against the flange and expand the same outward to form a tight joint with said walls.

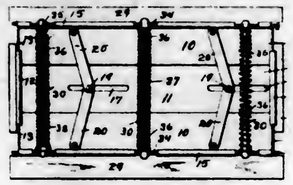
811,729. SHEET-METAL HUMIDOR. HENRY MACARTHY, New York, N. Y., assignor to American Can Company, New York, N. Y., a Corporation of New Jersey. Filed Oct. 26, 1905. Serial No. 284,493.



Claim.—1. In a sheet-metal humidor, the combination with double, hollow, upright sides provided with perforations in the inner walls thereof, and furnished with rabbets or angle-shoulders on the front upright edges thereof, of a double, hollow, hinged door and water-receptacle furnished with perforations in its inner wall above the water-receptacle portion thereof, and provided with rabbets or angle-shoulders on its upright edges, substantially as specified.

2. In a sheet-metal humidor, the combination with the upright side plates, of a double-walled, hollow, hinged door for containing water in its lower portion, and provided with perforations through the inner wall of the door at the upper portion thereof to enable the vapor or moisture to pass into the humidor from the water in the hinged door, substantially as specified.

811,780. LOOSE-LEAF BOOK. GEORGE H. MANGER, Des Moines, Iowa, assignor of one-fourth to John Weber, Jr., Des Moines, Iowa. Filed May 23, 1905. Serial No. 261,795.



Claim.—1. In a book, the combination of a back-frame, rods detachably connected with said back-frame, coil-springs, caps on the ends of the coil-springs, having said rods passed through them to pivotally connect them with the back-frame.

2. In a book, the combination of a back-frame, rods at the sides of the back-frame, coil-springs and caps for the coil-springs, each provided with a head formed with an opening to receive a rod and also formed with arms extended away from the head, then toward each other forming shoulders designed to engage the coils of the springs and secure the caps to the springs, said rods passed through the openings in said caps.

3. In a book, the combination of a back-frame, coil-springs connected at their ends to the sides of the back-frame and two stiffening-rods detachably inserted in the ends of the springs, and spaced apart at the centers of the springs.

4. In a book, the combination of a back-frame, coil-springs connected at their ends to the sides of the back-frame and two stiffening-rods at the opposite ends of one of the springs and one stiffening-rod at the central portion of one of the springs.

5. In a book, the combination of a back-frame, rods detachably connected to the sides of the back-frame, a number of coil-springs, caps for the ends of the coil-springs each comprising a body portion formed with an opening to receive said rod and also formed with arms having shoulders thereon to receive the ends of the coil-springs, headed stiffening-rods inserted in some of said arms, said heads engaged by the shoulders and a stiffening-rod at the central portion of one of the coil-springs.

6. In a book, a back-frame comprising a central strip formed with longitudinal slots and with its ends inclined upwardly, inwardly and downwardly, side pieces slidingly connected with the central piece and provided with side margins formed with loops and end margins slidingly inserted in the end portions of the central piece, the sliding bar below the central piece, pins passed through the slots in the former piece, arms pivoted to said pins extended outwardly and pivoted to the side pieces of the frame whereby longitudinal movement of the bar will move the side pieces inwardly and outwardly relative to each other and contractible coil-springs connected to the upturned side edges of the side pieces.

7. In a book, a back-frame comprising a central strip formed with longitudinal slots and with its ends inclined upwardly, inwardly and downwardly, side pieces slidingly connected with the central piece and provided with side margins formed with loops and end margins slidingly inserted in the end portions of the central piece, the sliding bar below the central piece, pins passed through the slots in the central piece, arms pivoted to said pins extended outwardly and pivoted to the side pieces of the frame whereby longitudinal movement of the bar will move the side pieces inwardly and outwardly relative to each other and a locking-lug formed with a keyhole connected to said bar.

8. In a book, a back-frame comprising a central strip formed with longitudinal slots and with its ends inclined upwardly, inwardly and downwardly, side pieces slidingly connected with the central piece and provided with side margins formed with loops and end margins slidingly inserted in the end portions of the central piece, the sliding bar below the central piece, pins passed through the slots in the central piece, arms pivoted to said pins extended outwardly and pivoted to the side pieces of the frame whereby longitudinal movement of the bar will move the side pieces inwardly and outwardly relative to each other, a locking-lug formed with a keyhole connected to said bar, a back-piece connected with the said central portion of the back-frame, said back-piece formed with a recess to receive the sliding bar and locking-lug, said back-piece also formed with a keyhole in line with that of the locking-lug.

811,781. LIFTING-JACK. HUGH M. MARSH, Chicago, Ill. Filed Oct. 4, 1905. Serial No. 281,205.

Claim.—1. In a lifting-jack, in combination, a standard, a lever pivoted to the standard, a rack-bar in sliding engagement with the standard, a pawl carried by the lever, a spring-rod engaging the pawl, and means carried by the lever for engaging the spring to deflect it as the lever makes its stroke.

2. In a lifting-jack, in combination, a standard, a lever pivoted to the standard, a rack-bar in sliding engagement with the standard, a pawl pivoted to the standard, a pawl pivoted to the lever, a spring-rod connecting the pawls, and a spring-deflector carried by the lever.

3. In a lifting-jack, in combination, a standard, a lever pivoted to the standard, a rack-bar in sliding engagement with the standard, a pawl pivoted to the standard, a pawl pivoted to the lever, a spring-rod connecting the pawls, and a spring-deflector pivotally united to the lever and engaging the wall of the standard.

4. In a lifting-jack, in combination, a standard, a lever pivoted to the standard, a rack-bar in sliding engagement with the standard, a pawl pivoted to the standard, a pawl pivoted to the lever, a spring-rod connecting the pawls, a spring-deflector pivotally united to the lever and engaging the wall of the standard, and a movable jaw mounted on the spring-deflector.

5. In a lifting-jack, in combination, a standard, a lever pivoted to the standard, a rack-bar in sliding engagement with the standard, a pawl pivoted to the standard, a pawl pivoted to the lever, a spring-rod connecting the pawls, an arm pivotally secured to the lever and in sliding engagement with the standard, a shoulder set transversely on the arm, and a movable jaw mounted on the arm.

6. In a lifting-jack, in combination, a standard, a lever pivoted to the standard, a rack-bar in sliding engagement with the standard, a pawl pivoted to the lever, a pawl pivoted to the standard, a spring-rod bearing on the pawls and having a coil intermediate its ends, and a spring-deflector carried by the lever and recessed to receive the coil.

7. In combination, a ratchet member, two pawls engaging the ratchet member, a spring-rod connecting the pawls, a pivoted lever for actuating one of the pawls, and a spring-deflector carried by the lever.

8. In a lifting-jack, in combination, a standard, a ratchet-bar reciprocating in the standard, a hand-lever pivoted to the standard, a pair of pawls engaging the bar, one being pivoted to the standard and the other to the lever, a spring-rod uniting the pawls, an arm pivoted to the lever and in sliding engagement with the standard and having transverse jaws engaging the spring.

9. In a lifting-jack, in combination, a standard, a ratchet-bar reciprocating in the standard, a hand-lever pivoted to the standard, a pair of pawls engaging the bar, one being pivoted to the standard and the other to the lever, a spring-rod uniting the pawls, an arm pivoted to the lever and in sliding engagement with the standard and having a transverse shoulder engaging the spring, a jaw slidingly engaging the arm, and an eccentric mounted on the arm and controlling the jaw.

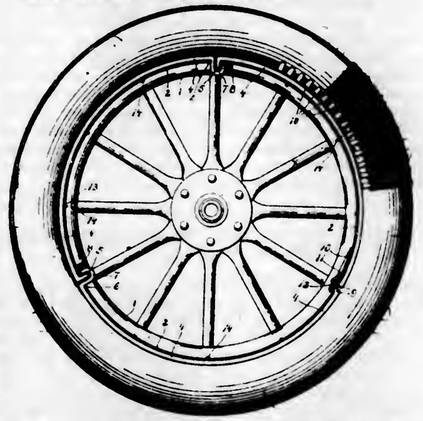
10. In a lifting-jack, in combination, a standard, a ratchet-bar reciprocating in the standard, a lever, a spring-actuated pawl, and automatic means for reversing the spring action on the pawl as the lever approaches the limits of its stroke.

11. In a lifting-jack, in combination, a standard, a ratchet-bar reciprocating in the standard, a lever, a spring-controlled pawl pivoted on the lever, a spring-controlled retaining-pawl pivoted on the standard, and means carried by the lever for reversing the spring action on the pawls as the lever reaches the limits of its stroke.

12. In a lifting-jack, in combination, a standard, a ratchet-bar reciprocating in the standard, a lever, a spring-controlled pawl pivoted on the lever, and means carried by the lever for reversing the spring action on the pawl as the lever reaches the limits of its stroke.

13. In a lifting-jack, in combination, a standard, a ratchet-bar reciprocating in the standard, a lever, a spring-controlled retaining-pawl pivoted on the standard, and means carried by the lever for reversing the spring action on the pawl as the lever reaches the limits of its stroke.

811,782. ARMOR FOR PNEUMATIC TIRES. ALANSON A. MOORE, Detroit, Mich., assignor of one-half to Frank H. Bessenger, Detroit, Mich. Filed Feb. 21, 1905. Serial No. 246,767.



Claim.—1. The combination with a tire and a rim of greater width than that portion of the tire which engages said rim, of a securing-band engaging the outer surface of the rim at one side of the tire, means on the ends of said band for drawing said ends toward each other to clamp the band to the rim, a series of chains extending transversely across the tire and forming an armor therefor, and means for securing the ends of the chains to said band.

2. The combination of a tire having laterally-extending flanges, a wheel-rim, bands engaging the outer surface of the rim and each provided with a laterally-extending flange to engage the flanges on the tire and hold the same to the rim, means on the ends of the bands for drawing the ends toward each other to clamp the bands to the rim, a tire-armor, and means for securing the armor to the said bands.

3. The combination with a tire and a wheel-rim to which the tire is secured, of an armor for the tire consisting of a series of independent chains, a securing-band engaging the outer surface of the wheel-rim at one side of the tire, means on the ends of said band for drawing said ends toward each other to clamp the band about the rim, adjustable means for securing each of said chains to said band, and means for preventing the said band from slipping laterally from the rim.

4. The combination with a tire and a wheel-rim to which the tire is secured, of an armor for the tire, a securing-band to engage the outer surface of the rim adjacent to the tire and made in two or more parts, an arm formed on one end of one part of the band, a hook on the adjacent end of the other part to embrace said arm, a set-screw carried by the hook and engaging the arms to force the ends of the parts of the band toward each other to clamp the same to the rim, and means for securing the armor to the said band.

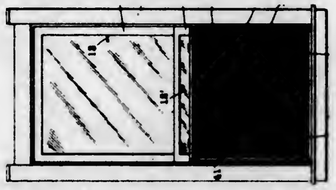
5. The combination with a tire and a wheel-rim to which the tire is adapted to be secured, of an armor for the tire, a securing-band to which the armor is attached adapted to engage the outer surface of the rim at one side of the tire, laterally-bent arms on the ends of said band, a lever pivotally attached to one of said arms and provided with a notch in one side at a distance from its pivot, and a loop pivotally attached to the arm on the adjacent end of the band and adapted to engage the notch in the lever when the same is passed through said loop.

6. The combination with a tire and a wheel-rim to which the tire is adapted to be secured, of an armor consisting of independent chains extending transversely of the tire with their edges in contact, securing-bands adapted to engage the outer surface of the rim at each side of the tire and each provided with a series of holes, means on said bands for drawing the ends of each toward each other to clamp the bands about the rim, adjusting-screws engaging the holes in the bands, stirrups attached to the ends of the chains, and nuts secured in said stirrups and engaging the screws.

7. The combination with a tire and a wheel-rim to which the tire is adapted to be secured, of a flexible strip on the tread of the tire, a series of independent flexible plates secured to said strip, a series of independent flat chains extending transversely of the tire in engagement with said plates, and means for adjustably and detachably securing the ends of the chains to the wheel-rim to form an armor for the tire and hold the strip with its plates in place.

8. The combination with a pneumatic tire, of a wheel-rim of greater width than the base of the tire which is adapted to be secured thereto and provided with longitudinal slots and notches in its edges, an armor consisting of independent chains formed of links woven flat and each having a central portion with parallel edges and tapering end portions, adjusting-screws secured to the ends of said chains, securing-bands engaging the outer surface of the rim at each side of the tire and each provided with a series of holes to receive the adjusting-screws, inwardly-extending arms on the ends of the bands extending through the notches in the rim, a lever pivoted to one of said arms on each band and provided with a notch in its side, a loop pivoted to the adjacent arm on each band to engage the notch in the lever, and pins on the bands to engage the slots in the rim.

811,733. **WINDOW-SCREEN.** ERNEST B. MORROW, Bluffton, Ind. Filed Jan. 23, 1905. Serial No. 242,236.



Claim.—1. A window-screen consisting of, a suitable frame and reticulated covering for said frame, a flap forming part of the upper cross-bar of said frame but hinged thereto, the inner edge of said flap being adapted to lie closely adjacent a portion of the window-sash, and a second flap hinged to the inner edge of the first-mentioned flap and having its inner edge projected into close proximity to the glass of the sash.

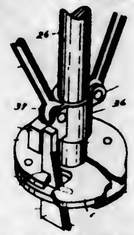
2. A window-screen consisting of, a suitable frame the upper cross-bar of which is narrower than the sides to which it is attached, and a flap hinged to the inner edge of said cross-bar and having an inner edge adapted to lie in close proximity to portions of the window-sash.

3. A window-screen consisting of a suitable frame and having an upper cross-bar of less width than the sides, a flap hinged to the inner edge of said cross-bar and extending substantially to the width of the sides, said flap having a rabbet formed in its lower inner corner, a flexible strip laid in said rabbet, a second flap of less thickness than the first flap hinged to the inner edge thereof, and a flexible strip carried by the inner edge of the said second flap, all substantially as and for the purpose set forth.

811,734. **AUTOMATIC GOVERNING DEVICE FOR GASOLENE-ENGINES.** DAVID C. MCCARROLL, Kansas City, Mo. Filed Nov. 20, 1904. Serial No. 233,702.

Claim.—1. In valve-operating mechanism a rotary shaft, a main cam-plate fixed on said shaft, and a supplemental cam-plate loosely connected with said shaft and having its cam in a normally open or extended position from the fixed cam said plates having registering openings extending tangentially to the said shaft, an angle-bar having an inclined edge within said registering openings adapted to move said loose cam-plate toward a coincident position with the cam on the fixed cam-plate and self-adjusting means for holding the supplemental cam-plate in contact with the said inclined edge of said angle-bar.

2. In valve-operating mechanism a rotary shaft, a main cam-plate fixed on said shaft and having a slot extending tangentially to the circumference of said shaft, an angle-bar having an inclined edge within said slot and a cam-blade loosely connected with said shaft and normally in an open position from the cam on the main cam-plate and having a notch in the direction of said angle-bar and a radial arm on said blade and resilient means for retaining the notched portion of the cam-blade in contact with the inclined edge of said angle-bar.



3. The combination in an engine with the governor-shaft and governor and with a valve-operating spring-controlled valve-stem on the engine of a compound cam on the governor-shaft consisting of a main cam-plate and cam fixed on said shaft and a supplemental member of said compound cam loosely connected with said shaft, said main and supplemental cam-plates having suitable registering openings extending tangentially to the circumference of said shaft said loose member of the compound cam having its cam-surface in a normally open or extended position from the cam on the fixed cam-plate and in the opposite direction to the rotation of said shaft both cam-surfaces of the compound cam being adapted to come into contact with the spring-actuated valve-stem and control the time of the opening and closing of said valve by the reciprocal movement of the loose member, and a movable angle-bar actuated by the governor having an inclined edge within said registering openings in said fixed and loose members of said compound cam with which inclined edge the side of the opening in the loose member contacts said angle-bar acting to vary the movements of the loose member of the compound cam from the reciprocal action of the valve-stem.

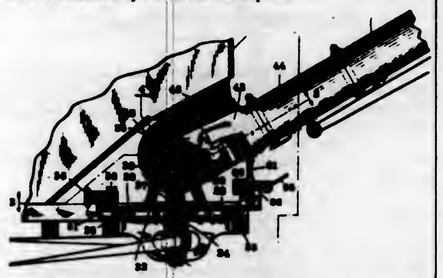
4. The combination in a gas-engine with the cylinder and piston and piston-rod, of a driving-shaft actuated thereby, gas supply and exhaust casings on said cylinders and valves within said casings, spring-retracted valve-stems connected with said valves, a governor-shaft and governor, a movable sleeve on said shaft, operated by the governor, means for transmitting power to the governor-shaft from the driving-shaft, a main cam-plate on the governor-shaft, having a slot therein, a supplemental cam plate or blade, a collar connected therewith extending around the shaft of the governor, an arm on said collar, a spring connected with the main cam-plate and said arm, and an angle-bar in the slot of the main cam-plate connected with the movable sleeve on the shaft of the governor and bearing against the supplemental cam-blade.

811,735. **DISH-WASHING MACHINE.** JOSEPHINE D. MCELROY, Leavenworth, Kans. Filed Aug. 7, 1905. Serial No. 273,158.

Claim.—The herein-described dish-washing machine consisting of a boiler having an upwardly-projecting pivot 2 from the bottom thereof, a reticulated dish-receptacle revolubly mounted on said pivot within said boiler, a bail on the upper end of said receptacle, said bail having formed therein a square socket 5, a combined bearing-frame and cover arranged on the upper end of said boiler, said frame comprising curved straps 7, a crank-shaft journaled in said bearing-frame and adapted to engage the squared socket in said bail, a crank arranged on said shaft, a knife and fork receptacle arranged on the bottom of said dish-receptacle, and a dish-holding tray adjustably secured in said receptacle to hold the dishes therein, substantially as described.

811,736. **PNEUMATIC STRAW-STACKER.** JOSEPH W. HETHEY, Indianapolis, Ind., assignor to The Indiana Manufacturing Company, Indianapolis, Ind., a Corporation of West Virginia. Filed June 26, 1905. Serial No. 267,626.

Claim.—1. The combination, in a pneumatic stacker, of a horizontally-positioned turn-table, a centrally-arranged driving-shaft vertically mounted therein, a horizontally-arranged fan-shaft mounted above said driving-shaft, a blast mechanism and conveyer structure pivotally mounted on said turn-table with the axes of the pivots and of the fan-shaft substantially coincident, a suitable means for revolving said turn-table, and suitable means for swinging the blast mechanism and conveyer structure on its pivot.



2. The combination, in a pneumatic stacker, of a horizontally-positioned turn-table, a driving-shaft vertically mounted therein, bearings carried by said turn-table at diametrically opposite sides of said driving-shaft, and a blast mechanism and conveyer-tube structure provided with gudgeons which rest in said bearings, the said gudgeons being hollow and forming the bearings for the fan-shaft of the blast mechanism.

3. The combination, in a pneumatic stacker, of a turn-table, a centrally-arranged driving-shaft mounted in said turn-table, bearings also mounted on said turn-table on diametrically opposite sides of said driving-shaft and extending to and beyond the end of said driving-shaft, a rigidly-constructed blast mechanism and conveyer structure provided with hollow gudgeons which extend to and rest in said bearings and which also form bearings for the fan-shaft, said driving-shaft and said fan-shaft being arranged so that their axes intersect, and suitable power-transmission devices connecting said two shafts.

4. The combination, in a pneumatic stacker, of a turn-table, a rigidly-constructed blast mechanism and conveyer structure pivotally mounted on said turn-table, a means of swinging said structure relatively to the turn-table consisting of a pivoted screw, a suitable screw-socket engaging therewith, and a pivoted housing in which said socket is mounted.

5. The combination, in a pneumatic stacker, of a horizontally-positioned turn-table, supports independent of the driving-shaft therefor, a driving-shaft mounted centrally in said turn-table, bearings carried by said turn-table at opposite sides of said driving-shaft, a blast mechanism and conveyer structure pivotally mounted in said bearings, and power-transmission devices connecting the driving-shaft and the fan-shaft of the blast mechanism.

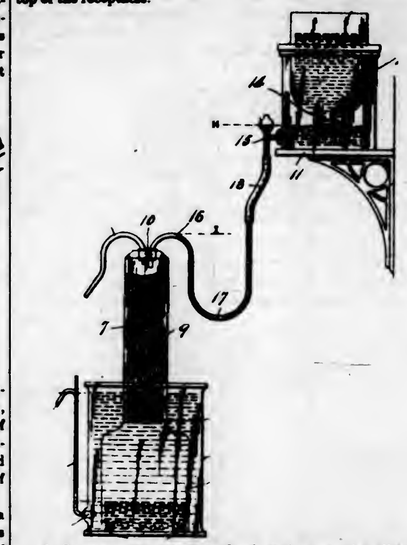
6. The combination, in a pneumatic stacker, of a turn-table, a blast mechanism and conveyer structure carried thereby, a vertically-arranged driving-shaft mounted centrally in said turn-table, and suitable supports for said turn-table independent of said shaft.

7. The combination, in a pneumatic stacker, of a suitable horizontally-pivoted straw-receiving hopper having a conveyer-pipe leading therefrom, a suitable blast mechanism communicating with said hopper, the axes of the blast mechanism and of the hopper-pivot being coincident, a turn-table provided with bearings for the support of said devices, and a vertical driving-shaft positioned centrally in said turn-table.

8. The combination, in a pneumatic stacker, of a horizontally-rotatable turn-table, a vertical driving-shaft mounted centrally therein, a blast mechanism embodying a horizontal shaft positioned vertically above said driving-shaft, power-transmission devices connecting said two shafts, and a suitable horizontally-pivoted straw-receiving hopper having a conveyer-pipe leading therefrom, the axes of the hopper-supporting pivots and of the blast mechanism shaft being coincident.

811,737. **GAS-GENERATOR.** CHARLES L. PARSONS, Durham, N. H. Filed July 23, 1904. Serial No. 217,044.

Claim.—1. In a gas-generator, a tank provided with an overflow communicating with said tank adjacent the bottom, a receptacle open at the bottom and closed at the top disposed within the tank, means within the receptacle for supporting a solid in granular form and means for supplying a liquid under constant head to the top of the receptacle.



2. In a gas-generator, a tank adapted to contain a liquid and provided with an overflow communicating therewith adjacent the bottom, a receptacle open at the bottom and submerged in the tank, a hollow solid-containing column open at the bottom, integral with and communicating with the said receptacle, a tube provided with a liquid seal and communicating with the column and an elevated reservoir adapted to supply liquid to the column through the pipe at a constant pressure equal to the normal pressure exerted on the gas by the liquid in the said tank.

3. In a gas-generator, a reservoir adapted to contain a liquid, a vessel with a reduced neck inverted in said reservoir, and disposed to form a liquid seal, a pipe connected with the reservoir below the level of the vessel-neck and provided with a liquid seal, a tank adapted to contain a liquid and provided with an overflow communicating therewith adjacent the bottom, a receptacle open at the bottom and submerged in the tank, a hollow solid-containing column open at the bottom and integral with and communicating with the said receptacle and disposed to receive a liquid from the said pipe and all so disposed that the pressure of the liquid from the reservoir shall equal the pressure of the liquid in the tank and be sustained thereby through the medium of the gas in the receptacle.

811,738. **RAILWAY-SWITCH.** LOUIS R. PARSONS, Stronghurst, Ill. Filed July 27, 1905. Serial No. 271,500.

Claim.—1. The combination with a main track and a siding, of a movable switch-point, a crank disk or element, operative connections between the crank of said disk and said point, an oscillatory device, a connection between said device and said disk, trip-levers upon said oscillatory device, means for limiting the swinging movement of said levers, and means for holding said levers normally in a projected position.

2. The combination with a main track and a siding, of a movable switch-point, a crank disk or element, operative connections between the crank of said disk and said point, an oscillatory disk formed with a segmental-shaped recess, radially-projecting trip-levers pivoted in said recess and adapted to swing inwardly into the same, and springs for retaining said trip-levers in engagement with the ends of said recess.

3. The combination with a main-line track and a siding, of movable switch-points, a bar connecting said points, a crank-disk, a link connecting said bar and the crank of said disk, oscillatory disks mounted adjacent to said tracks and formed with segmental-shaped recesses, cranks connecting said oscillatory disks and said crank-disk, levers pivoted in the recesses in said oscillatory disks, and springs for holding said levers in engagement with the ends of said disks, substantially as described.

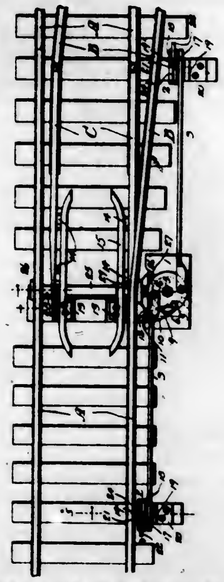
4. The combination with a main-line track and a siding, of movable switch-points, a shaft journaled beneath same and formed at

with the other, a bracket upon said brace, a bar pivotally connected with the bracket and carrying a level, and an index-plate connected

811,742.

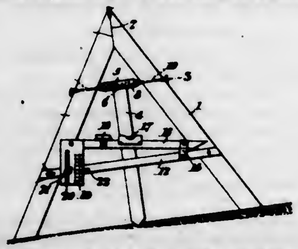
and of less immersed area than the immersed area of the hull, whereby said hull may be lifted above the surface of the water at high

4. The combination with a main-line track and a siding, of movable switch-points, a shaft journaled beneath same and formed at diametrically opposite points with notches to receive said points, a beveled gear, a beveled pinion upon said shaft and in mesh with said gear, and oscillatory devices mounted adjacent to said tracks, and links connecting said devices and said gear, substantially as described.



5. The combination with a main-line track and a siding, of movable switch-points, a bar connecting said points, a locking-shaft journaled beneath said points and having notches to receive the latter, a beveled gear, a beveled pinion upon said shaft in mesh with said gear, a crank-pin upon said gear, a link pivoted to said bar and formed with a slot to receive said crank-pin, oscillatory disks mounted adjacent to said tracks and formed with recesses, links connecting said disks and said gearing, levers pivotally mounted in the recesses in said disks, and springs for holding said levers in engagement with the ends of said recesses, substantially as described.

811,739. GRADE-LEVEL. DAVID W. PELPREY and WILLIAM S. RIDDLE, Haleyville, Ala. Filed Nov. 16, 1905. Serial No. 287,715.



Claim.—1. In a grade-level, a frame including legs or side members having oblique hingedly-connected ends, a third leg having a tubular head, a pivot for said head including a bolt and a pair of end members connected thereby, and tightening-bolts extending through apertures in the side members of the frame and engaging threaded recesses in the ends of the pivot member.

2. In a grade-level, a frame including a pair of side members and a third pivotally-supported member, and pivotal supporting means for said third member including means whereby the side members of the frame are drawn toward each other and toward said third member.

3. In a grade-level, a frame including side members, a brace connected pivotally with one of said side members and detachably with the other, a bracket upon said brace, a bar pivotally connected with the bracket and carrying a level, and an index-plate connected with the level-carrying bar and having a slot engaging a fastening member upon the brace-bar.

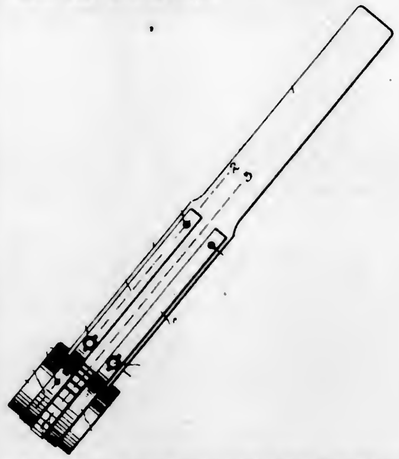
811,740. HINGE. MAURICE L. PETER and WILLIAM J. SHURBET, Columbus, Ohio. Filed May 25, 1905. Serial No. 262,131.

Claim.—1. A hinge having one of its members provided with projections adapted to engage one side of a door-jamb or the like, and a screw carried by the member adapted to engage the opposite side of the jamb to fasten the member in place.

2. In a hinge, an elongated member provided at its pivot end with lugs, and an adjustable fastening device carried at the opposite end of the member.

3. In a hinge, the combination with the hinge member, of an elongated hinge member pivotally connected with the first-named hinge member and provided with lugs at its point of connection with the said member, the said elongated member having a lug at its outer or free end, and a screw-threaded fastening device adjustably mounted in the lug.

811,741. WRENCH. PETER T. PETERSON, Spatten, Minn. Filed May 29, 1905. Serial No. 262,262.



Claim.—A wrench comprising a handle having a curved recess in one of its ends and longitudinally-extending recesses in one of its faces, a rotary head of cylindrical form seated in said curved recess and formed with a nut-engaging socket, clamping-bands surrounding said head and having one of their ends secured upon said handle and their opposite ends seated in said longitudinal recesses, clamping-strips for retaining said bands in said recesses, clamping-screws passed through said bands and strips and into said handle, an annular series of ratchet-teeth upon said head, and a spring-pawl upon said handle to engage said teeth.

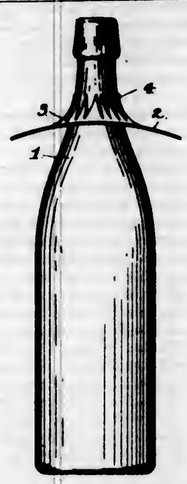
811,742. DRIP ATTACHMENT FOR BOTTLES. MARGARET PETER, San Francisco, Cal. Filed June 19, 1905. Serial No. 265,669.

Claim.—1. A drip attachment for bottles, comprising a section of absorbent material having a plurality of slits, each slits forming inwardly-projecting tongues of said material to secure said attachment to the neck of a bottle, substantially as described.

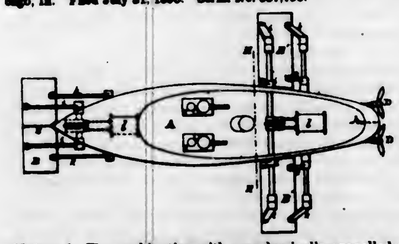
2. A drip attachment for bottles comprising a section of absorbent material having a central orifice and a plurality of tongues of said material projecting inwardly to said orifice for securing said attachment to the neck of a bottle, substantially as described.

3. A drip attachment for bottles comprising a section of absorbent material having a plurality of equidistant tongues projecting inwardly to a central orifice in said attachment for securing said attachment to the neck of a bottle, substantially as described.

811,742.



811,743. MARINE NAVIGATION. SIDNEY A. REEVE, Brooklyn, N. Y., assignor to William M. Meacham and Larned H. Meacham, Chicago, Ill. Filed July 31, 1905. Serial No. 267,796.



Claim.—1. The combination with a mechanically-propelled vessel of plates located on each side thereof, and having their front and rear edges independently connected to the vessel by swinging links, and means for swinging the said links on their upper pivots and holding them in adjusted position.

2. The combination with a mechanically-propelled vessel of plates located on each side thereof, and having their front and rear edges independently connected to the vessel by swinging links, a plate extending across and under the bow and having similar swinging links connected therewith, and means for swinging the links on their upper pivots and holding them in adjusted position.

3. The combination with a mechanically-propelled vessel, of the plate B at the bow and the plates B' each side of the hull, each of said plates having their front and rear edges connected to the vessel by the independent swinging links *i k*, and means for swinging the links on their upper pivots and holding them in adjusted position.

4. In a water-conveyance, the combination with a body or vessel for receiving the passengers or load, of inclined supporting-plates connected thereto and moving edgewise through the water at an inclination to the longitudinal horizontal line to give support to the body or vessel, said inclined supporting-plates extending below the bottom of the body of the vessel, so that when the conveyance is in motion the body of the vessel may be supported entirely above the surface of the water, substantially as specified.

5. In a water-conveyance, the combination with a body or vessel for receiving the passengers or load, of inclined supporting-plates connected thereto and moving edgewise through the water at an inclination to the longitudinal horizontal line to give support to the body or vessel, and a propeller for imparting forward motion to the conveyance, said inclined supporting-plates extending below the bottom of the body of the vessel, so that when the conveyance is in motion the body of the vessel may be supported entirely above the surface of the water, substantially as specified.

6. A self-propelled vessel having a flotative body or hull, and a reactionary surface extended below the molded surface of said hull and of less immersed area than the immersed area of the hull, whereby said hull may be lifted above the surface of the water at high speeds by reaction.

7. The combination with a self-propelled vessel of two or more supporting-plates arranged one above another and attached to the vessel by means of movable standards.

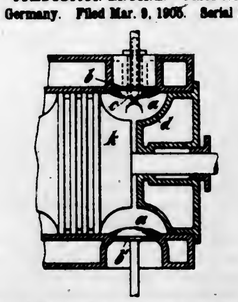
8. In a water-conveyance, the combination with a body or vessel, of a front inclined supporting or carrying plate B, and rear inclined carrying-plates B' B', the latter arranged one at each side of the conveyance, and at opposite angles to each other in respect to a transverse horizontal line.

9. In a water-conveyance, the combination with a body or vessel, of a front inclined supporting or carrying plate B, and rear inclined carrying-plates B' B', the latter arranged one at each side of the conveyance, and at opposite angles to each other in respect to a transverse horizontal line, and a propeller.

10. The combination with a boat or vessel, of supporting-plates on opposite sides of the vessel and adapted to be extended below the bottom of the same, movable supports for said plates and manually-regulated means for adjusting said plates simultaneously as to their angle relative to the line of motion.

11. The combination with a boat or vessel, of supporting-plates on opposite sides of the vessel and adapted to be extended below the bottom of the same, movable supports for said plates, and manually-regulated means for adjusting said plates simultaneously as to their depth of submergence.

811,744. COMBUSTION-ENGINE. FRITZ REICHENBACH, Charlottenburg, Germany. Filed Mar. 9, 1905. Serial No. 249,203.



Claim.—1. In an internal-combustion engine, the combination of a cylinder having a head, a piston, the piston and head forming when in juxtaposition an annular combustion-chamber, inlet and exhaust valves, and a fuel-injector arranged tangentially to said annular chamber, for the purpose set forth.

2. In a double-acting internal-combustion engine, the combination of a cylinder having a head, a piston carried by a rod working through said head, the adjacent faces of the piston and head being so shaped as to form an annular chamber when they are in juxtaposition, inlet and exhaust valves, and a fuel-injector arranged tangentially to said annular chamber, for the purpose set forth.

811,745. SIDE-DELIVERY HAY RAKE AND LOADER. MADISON REW, Grinnell, Iowa. Filed Oct. 17, 1904. Serial No. 228,788.

Claim.—1. In a side-delivery hay rake and loader, a laterally and upwardly moving conveyer provided with means for raking the hay from the ground and elevating it to a point of discharge.

2. In a side-delivery hay rake and loader, a laterally and upwardly moving conveyer provided with means for raking the hay from the ground and elevating it to a point of discharge, and means for adjustably supporting the delivery end of the conveyer.

3. In a side-delivery hay rake and loader, a wheel-bearing frame, a laterally and upwardly moving conveyer mounted at the rear of said frame provided with means for gathering the hay from the ground and elevating it to a point of discharge, and means for supporting the rear side of the conveyer, for the purposes stated.

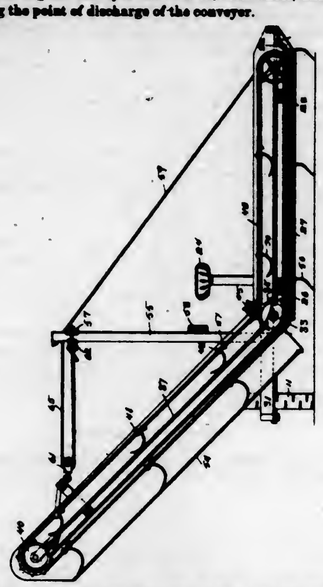
4. In a side-delivery hay rake and loader, a wheel-supported frame, a traction-wheel mounted therein, a laterally and upwardly moving conveyer provided with means for gathering the hay from the ground and elevating it to a point of discharge, and means for operatively connecting the conveyer with the traction-wheel.

5. In a side-delivery hay rake and loader, a wheel-supported frame, a traction-wheel mounted therein, a laterally and upwardly

moving conveyer provided with means for gathering the hay from

means for connecting the free end of the

moving conveyer provided with means for gathering the hay from the ground and elevating it to a point of discharge, means for operatively connecting the conveyer with the traction-wheel, and means for varying the point of discharge of the conveyer.



6. In a side-delivery hay rake and loader, a wheel-supported frame, a traction-wheel mounted therein, a laterally and upwardly moving conveyer provided with means for gathering the hay from the ground and elevating it to a point of discharge, means for operatively connecting the conveyer with the traction-wheel, and means for tightening the conveyer on its supports.

7. In a side-delivery hay rake and loader, a wheel-supported frame, a traction-wheel mounted therein, a laterally and upwardly moving conveyer provided with means for gathering the hay from the ground and elevating it to a point of discharge, means for operatively connecting the conveyer with the traction-wheel, means for varying the point of discharge of the conveyer, and means for tightening the conveyer on its supports.

8. In a side-delivery hay rake and loader, a frame, a traction-wheel in the frame, a lower carrier-frame at the rear of the frame, means for supporting the rear side of the lower carrier-frame, an upper carrier-frame pivoted at one end of said lower carrier-frame, means for supporting the free end of the upper carrier-frame, and an endless conveyer provided with means for gathering the hay from the ground and elevating it laterally, supported by the upper and lower carrier-frames, for the purposes stated.

9. In a side-delivery hay rake and loader, a frame, a traction-wheel in the frame, a lower carrier-frame at the rear of the frame, means for supporting the rear side of the lower carrier-frame, an upper carrier-frame pivoted at one end of said lower carrier-frame, means for supporting the free end of the upper carrier-frame, an endless lateral conveyor supported by the upper and lower carrier-frames, comprising two endless chains connected by a series of rotatably-mounted shafts, a series of teeth mounted on each of said shafts, and a guide-roller designed to maintain the teeth in position as the carrier is operated for raking hay from the ground and elevating it laterally.

10. In a side-delivery hay rake and loader, a frame, a traction-wheel in the frame, a lower carrier-frame at the rear of the frame, means for supporting the rear side of the lower carrier-frame, an upper carrier-frame pivoted at one end of said lower carrier-frame, means for supporting the free end of the upper carrier-frame, an endless conveyor provided with means for raking and elevating hay laterally from the ground, supported by the upper and lower carrier-frames, and draft sprocket-wheels for operating said conveyor.

11. In a side-delivery hay rake and loader, a frame, a traction-wheel in the frame, a lower carrier-frame at the rear of the frame, means for supporting the rear side of the lower carrier-frame, an upper carrier-frame pivoted at one end of said lower carrier-frame, means for supporting the free end of the upper carrier-frame, an endless conveyor provided with means for raking and elevating hay laterally from the ground supported by the upper and lower carrier-frames, draft sprocket-wheels for operating said conveyor, and means for maintaining the conveyor in engagement with the sprocket-wheels.

12. In a side-delivery hay rake and loader, a frame, a traction-wheel in the frame, a lower carrier-frame at the rear of the frame, means for supporting the rear side of the lower carrier-frame, an upper carrier-frame pivoted at one end of said lower carrier-frame, means for supporting the free end of the upper carrier-frame an endless conveyer provided with means for raking hay from the ground and supported by the upper and lower carrier-frames, and a trough mounted beneath the upper carrier-section through which the hay is to be drawn by the conveyer in elevating it to a point of discharge.

13. In a side-delivery hay rake and loader, a frame, a traction-wheel in the frame, a lower carrier-frame at the rear of the frame, means for supporting the rear side of the lower carrier-frame, an upper carrier-frame pivoted at one end of said lower carrier-frame, means for supporting the free end of the upper carrier-frame, an endless conveyer supported by the upper and lower carrier-frames, teeth in the conveyer, a trough mounted beneath the upper carrier-section through which the hay is to be drawn by the teeth on the conveyer in elevating it to a point of discharge, and means for adjusting the free end of the upper carrier upwardly and downwardly, said means being within the reach of an operator sitting on the seat of the loader.

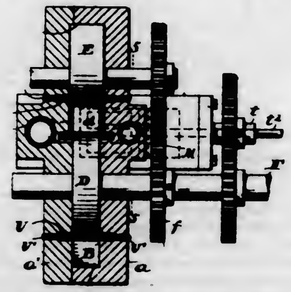
14. In a side-delivery hay rake and loader, two carrier-frames, a laterally and upwardly moving endless conveyer capable of gathering the hay from the ground and elevating it to a point of discharge comprising two endless chains, a series of rocking shafts connecting these chains, a series of teeth mounted upon these shafts, and a guide-roller designed to coact with the carrier-frames around which the conveyer passes for maintaining the shafts against rocking movement as the teeth are raking and elevating hay.

15. In a side-delivery hay rake and loader, two carrier-frames, a laterally and upwardly moving endless conveyer capable of gathering the hay from the ground and elevating it to a point of discharge, comprising two endless chains, a series of rocking shafts connecting these chains, a series of teeth mounted upon these shafts, a guide-roller designed to coact with the carrier-frames around which the conveyer passes for maintaining the shafts against rocking movement as the teeth are raking and elevating hay, and means for adjustably supporting the delivery end of the elevating-conveyer.

811,746. **ROAD-BED.** GEORGE ROSS and STEPHEN F. DEAL, Kansas City, Mo. Filed June 9, 1905. Serial No. 264,982.

Claim.—The herein-described road-bed, consisting of a rolled and hardened admixture of a layer of natural earth with the following-named liquids: crude petroleum, asphaltum, and crude carbolic acid, in the proportions of, eighty per cent. of crude petroleum, fifteen per cent. of liquid asphaltum, and five per cent. of crude carbolic acid; substantially as described.

811,747. **ROTARY ENGINE.** WILLIAM J. ROWE and ARBA L. WYTHOCK, Cleveland, Ohio. Filed Mar. 3, 1904. Serial No. 196,264.



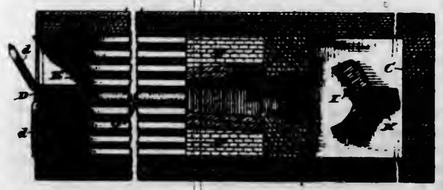
Claim.—1. In a rotary engine, the combination of a casing containing a cylindrical piston-chamber, a rotary piston, of smaller diameter located therein, a piston-blade secured thereto, there being two inlet-ports leading to one side of the annular space within said chamber around said piston, and two outlet-ports leading from the opposite side thereof, and said casing containing two cylindrical chambers with which said inlet and outlet ports respectively communicate, and there being an inlet-port to one of said chambers and an outlet-port from the other, with two cylindrical valves which are mounted respectively in said chambers and are each provided with two ports, and mechanism connecting said valves whereby they may be rocked simultaneously, substantially as and for the purpose specified.

2. In a rotary engine, the combination of a casing containing a cylindrical piston-chamber, a rotary piston therein having a piston-blade, and a movable abutment, there being two inlet-ports through one end of said piston-chamber but on opposite sides of said abutment, and two exhaust-ports through the other end of said piston-chamber and on opposite sides of said abutment, an exhaust-valve chamber with which the two exhaust-ports connect, an inlet-valve chamber with which the two inlet-ports connect, a valve in each of said two chambers adapted to simultaneously open one of the ports connected with it and to close the other port, connections between said two valves whereby they operate simultaneously, a cylindrical cut-off-valve chamber communicating with the inlet-valve chamber referred to, a rotary cut-off valve, and mechanism connecting said valve with the rotary piston, substantially as and for the purpose specified.

3. In a rotary engine, the combination of a casing which contains two intersecting cylindrical chambers of unequal diameter, a parallel cylindrical cut-off chamber adapted to be connected with the steam-supply, and two valve-chambers each having two ports connecting it to the larger of the intersecting chambers and one having an exhaust-port and the other being connected with said cut-off chamber, valves in said valve-chambers to control and direct the flow of steam through the ports which communicate with said larger chamber, with a rotary cut-off valve in the cut-off chamber, a rotary piston carrying the blade in the larger of the intersecting chambers, a rotary abutment in the third chamber in peripheral contact with the piston and having a peripheral recess, and mechanism connecting said three rotatable elements, substantially as and for the purpose specified.

4. In a rotary engine, the combination of a casing containing a cylindrical piston-chamber, a rotary piston therein having a piston-blade, and a movable abutment, there being two inlet-ports to one end of said piston-recess and on opposite sides of said abutment and two exhaust-ports to the other end of said piston-chamber and on opposite sides of said abutment, with a valve for controlling the passage of steam to either of said inlet-ports, a rotary cut-off controlling the flow of steam to said valve, and mechanism intermediate of said piston and cut-off valve for operating the latter, substantially as and for the purpose specified.

811,748. **SMOKELESS FURNACE.** FRANK D. SHEPHERD, Salt Lake City, Utah. Filed Mar. 18, 1904. Serial No. 198,810.



Claim.—1. A furnace, comprising a grate, a longitudinal partition-wall dividing the ash-pit, beneath the grate, a bridge-wall supporting the rear end of the grate, doors upon either side of said partition-wall, a second partition-wall in rear of said bridge-wall, and extending from the floor to the lower side of the boiler, a flume extending through said bridge-wall and through said partition-wall, side walls built on said bridge-wall for increasing the depth of said flume, said side walls flaring rearwardly, and a curved deflector-wall opposite the rear exit of said flume and presenting a concave face toward said flume.

2. In a furnace, the combination of a grate, a bridge-wall having a flume formed therein which flume is open at its forward end and is open above to the boiler, and a deflector-wall opposite the rear end of said flume to deflect the gases upward toward the boiler and laterally.

3. In a furnace, the combination of a grate, a bridge-wall, and a partition-wall, there being a flume constructed through said bridge-wall and said partition-wall, and a deflector-wall spaced from the rear end of said flume for throwing the gases upward and laterally against the under side of the boiler.

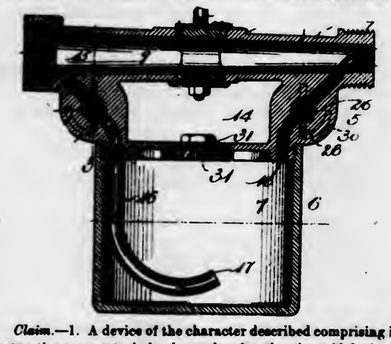
4. In a furnace, the combination of a grate, a bridge-wall, and a partition-wall, there being a flume constructed through said bridge-wall and said partition-wall, and a deflector-wall spaced from the rear end of said flume for throwing the gases upward and laterally against the under side of the furnace, said flume increasing in cross-sectional area progressively in a rearward direction.

5. In a furnace, the combination of a front wall having air-admitting openings at each side of the center and below the level of the grate, a grate, a longitudinal wall beneath the grate and dividing the ash-pit into two chambers, a bridge-wall, and a partition-wall having a flume extending therethrough, and a deflector-wall opposite the rear end of said flume and having a reëntrant front face, said deflector-wall being adapted to throw the flames against the under side of the boiler.

6. In a furnace, the combination of a front wall having air-admitting openings in each side of the center and below the level of the grate, a grate, a longitudinal wall beneath the grate and dividing the ash-pit into two chambers, a bridge-wall, a partition-wall, said bridge and partition walls having a flume extending therethrough, and a deflector-wall opposite the rear end of said flume and having a reëntrant front face, said flume having side walls built upon said bridge-wall for increasing its depth.

7. In a furnace, the combination of a grate, a bridge-wall, and a flume passing through said bridge-wall, and formed partially by vertical walls extending forward from said bridge-wall, said vertical walls approaching each other in a rearward direction.

811,749. **AUTOMATIC MIXER AND DISTRIBUTER.** AMOS N. SOMERS, Sharon, Mass. Filed July 7, 1905. Serial No. 268,691.



Claim.—1. A device of the character described comprising in its construction a receptacle having a chamber therein, said device provided with a main passage outside said chamber, said main passage having an inlet and an outlet orifice, said device provided with an inlet-passage leading from said main passage at the inlet end thereof to said chamber, a tube connected to said inlet-passage and projecting therefrom downwardly toward the bottom of said chamber, said device provided with an outlet-passage leading from said chamber into the outlet end of said main passage, a stop-cock located in said main passage between the points where said inlet and outlet passages connect with said main passage, graduations whereby the angular location of said stop-cock relatively to the median line of said main passage is indicated, a stop-cock located in each of said inlet and outlet passages, respectively, and graduations whereby the extent of opening of said last-named stop-cocks is indicated.

2. A device of the character described comprising in its construction a receptacle having a chamber therein, said device provided with a main passage outside said chamber, said main passage having an inlet and an outlet orifice, said device provided with an inlet-passage leading from said main passage at the inlet end thereof to said chamber, a tube connected to said inlet-passage and projecting therefrom downwardly toward the bottom of said chamber, said device provided with an outlet-passage leading from said chamber into the outlet end of said main passage, a stop-cock located in said main passage between said inlet and outlet passages, and a stop-cock located in each of said inlet and outlet passages, respectively.

3. A device of the character described comprising in its construction a receptacle having a chamber therein, said device provided with a main passage outside said chamber, said main passage

having an inlet and an outlet orifice, said device provided with an inlet-passage leading from said main passage at the inlet end thereof to said chamber, a tube connected to said inlet-passage and projecting therefrom downwardly toward the bottom of said chamber and curved at its lower end to extend partly around said chamber, said device provided with an outlet-passage leading from said chamber into the outlet end of said main passage, a stop-cock located in said main passage between said inlet and outlet passages, and a stop-cock located in each of said inlet and outlet passages, respectively.

4. A device of the character described comprising in its construction a receptacle having a chamber therein, said device provided with a main passage outside said chamber, said main passage having an inlet and an outlet orifice, said device provided with an inlet-passage leading from said main passage at the inlet end thereof to said chamber, a tube connected to said inlet-passage and projecting downwardly therefrom toward the bottom of said chamber and curved at its lower end to extend partly around said chamber, said device provided with an outlet-passage leading from said chamber into the outlet end of said main passage, a tube leading from said outlet-passage into said main passage at its outlet end, bent at the free end thereof, and terminating concentric with said main passage adjacent to the outlet-orifice thereof.

5. A device of the character described comprising in its construction a top and a base, detachably fastened together, said base comprising in its construction a receptacle having a chamber therein, said top comprising in its construction a tubular handle extending transversely across said receptacle and terminating at its opposite ends in an inlet and an outlet orifice, respectively, with screw-threaded projections thereon, a stop-cock in said tubular handle between said orifices, said top provided with an inlet-passage extending from the interior of said tube adjacent to said inlet-orifice to the interior of said receptacle and with an outlet-passage leading from the interior of said receptacle to the interior of said tube adjacent to said outlet-orifice, and a stop-cock located in each of said inlet and outlet passages, respectively.

811,750. **HEAT-STORING COMPOUND.** FREDERIC O. SPIESER, Brooklyn, N. Y. Filed Aug. 29, 1905. Serial No. 276,283.

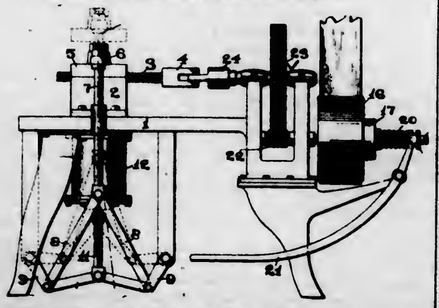
Claim.—1. A heat-storing compound consisting of acetate of soda and chlorid of calcium.

2. A heat-storing compound consisting of acetate of soda, chlorid of calcium and hyposulfite of soda.

3. A heat-storing compound consisting of a heat-storing salt, and chlorid of calcium.

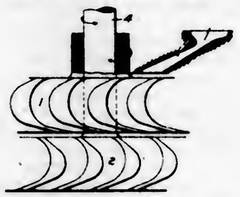
4. A heat-storing compound consisting of a heat-storing salt and a non-poisonous, soft, crystalline substance, adapted to cause the formation of a comparatively soft crystal and to regulate the amount of heat to be generated by the compound without producing a poisonous mixture.

811,751. **GEARING.** FRANCIS M. STANBAUGH, St. Louis, Mo., assignor to The American Brake Company, St. Louis, Mo., a Corporation of Missouri. Filed Mar. 7, 1905. Serial No. 248,849.



Claim.—In a machine of the class described, a mandrel, a shaft on which said mandrel is mounted, a gear on said shaft, a drive-shaft, a pinion thereon that meshes with said gear, a loose pulley mounted on said drive-shaft and provided with a friction-face, a clutch member splined to said shaft and having a cooperating friction-face, a follower reciprocatingly mounted on the drive-shaft, a spring surrounding the drive-shaft and interposed between the follower and the clutch member, and a lever in engagement with said follower and adapted to be actuated for moving the clutch member into engagement with the loose pulley and holding it there with a yielding pressure; substantially as described.

811,752. **STEAM OR GAS TURBINE.** JOHANN STUMPF, Berlin, Germany, assignor to General Electric Company, a Corporation of New York. Filed Oct. 6, 1904. Serial No. 227,353.



Claim.—1. In an elastic-fluid turbine, the combination of a nozzle or fluid-discharging device, a primary bucket-wheel receiving motive fluid from the nozzle or fluid-discharging device, and a secondary bucket-wheel receiving motive fluid directly from the primary wheel, the buckets of the secondary wheel being so shaped that its speed exceeds that of the primary wheel.

2. In an elastic-fluid turbine, the combination of a nozzle, a primary bucket-wheel receiving motive fluid from the nozzle, a secondary bucket-wheel receiving motive fluid directly from the primary wheel, the buckets of the wheels being so shaped that the speed of the secondary wheel exceeds that of the primary wheel, and primary and secondary shafts connected respectively to the said wheels.

3. An elastic-fluid turbine comprising primary and secondary bucket-wheels, a nozzle and shafts connected to the wheels, in combination with load devices connected respectively to the shafts, the secondary wheel and load device connected thereto revolving at a speed greater than that of the primary wheel and its connected load device.

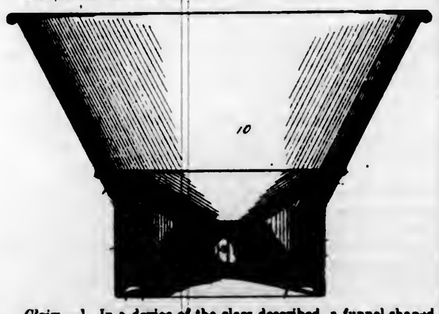
811,753. **HARROW-TOOTH.** JAMES M. ULSH, Lancaster, Pa. Filed July 29, 1905. Serial No. 271,802.

Claim.—1. The combination with a tooth-bar, of a harrow-tooth having its top portion arranged beneath the tooth-bar with the terminal extended upward at the front of the said bar, said tooth being extended rearwardly and downwardly from the tooth-bar, and an inclined fastening device piercing the tooth-bar and the top portion of the harrow-tooth and extending from the back of the upper portion of the tooth-bar to the lower front portion thereof and having its lower end arranged at the front of the terminal of the upper portion of the harrow-tooth at a point in advance of the bottom of the tooth-bar, whereby when pressure is applied to the point of the tooth, the entire strain will be against the bottom of the tooth-bar and transversely of the fastening device.

2. The combination with a tooth-bar, of a harrow-tooth having its top portion sigmoidally bent into substantially a horizontal compound curve, the front portion of the curve presenting a concave upper face and lying beneath the tooth-bar and extending upward at the front of the same, and an inverted inclined fastening device piercing the tooth-bar and the harrow-tooth and extending from the back of the upper portion of the tooth-bar to the lower portion of the front of the same, the head of the bolt being arranged at the front of the upwardly-extending terminal of the top portion of the harrow-tooth and at a point in advance of the bottom of the tooth-bar, whereby when the point of the tooth is subjected to pressure, the entire strain will be against the bottom of the tooth-bar and transversely of the bolt.

3. The combination with a tooth-bar, of a harrow-tooth having its top portion sigmoidally bent into substantially a horizontal compound curve, the front portion of the curve presenting a concave upper face and lying beneath the tooth-bar and extending upward at the front of the same, and an inverted inclined fastening device piercing the tooth-bar and the harrow-tooth and extending from the back of the upper portion of the tooth-bar to the lower portion of the front of the same, the head of the bolt being arranged at the front of the upwardly-extending terminal of the top portion of the harrow-tooth and at a point in advance of the bottom of the tooth-bar, whereby when the point of the tooth is subjected to pressure, the entire strain will be against the bottom of the tooth-bar and transversely of the bolt, and a brace provided with a sigmoidally-bent top portion conforming to the configuration of the harrow-tooth and fitted against the back and upper face of the top portion of the same and secured to the harrow-tooth and to the tooth-bar by the said bolt.

811,754. **STRAINER.** ALEXANDER L. WEST, Gowris, Iowa. Filed Feb. 6, 1905. Serial No. 244,403.



Claim.—1. In a device of the class described, a funnel-shaped portion having a number of openings in the lower portion of its sides, a screen in each of these openings, and an oval bottom for the funnel, and a funnel-shaped screen inverted and placed upon the bottom, for the purposes stated.

2. In a device of the class described, a funnel-shaped portion having a number of openings in the lower portion of its sides, a screen in each of these openings, an oval bottom for the funnel, an inverted-funnel-shaped screen having a funnel attached to its upper end designed to engage the first-mentioned funnel when the inverted-funnel-shaped screen is placed upon the bottom.

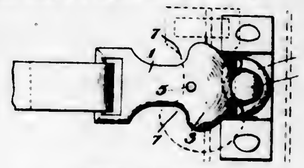
3. In a device of the class described, a funnel-shaped portion having a number of openings in the lower portion of its sides, a screen in each of these openings, an oval bottom for the funnel, an inverted-funnel-shaped screen having a funnel attached to its upper end designed to engage the first-mentioned funnel when the inverted-funnel-shaped screen is placed upon the bottom, a circular band at the lower end of the funnel-shaped screen, and means for securing the funnel-shaped screen between the band and the lower portion of the funnel attached to the screen rigidly in position relative to each other.

4. In a strainer, a funnel-shaped portion, a circular portion at the bottom of the funnel-shaped portion having a number of openings in it, a woven-wire screen in each of these openings, a bottom connected with the lower end of the circular portion, a funnel-shaped screen inverted and placed upon the bottom, comprising two circular bands, and means for securing these bands in position relative to each other.

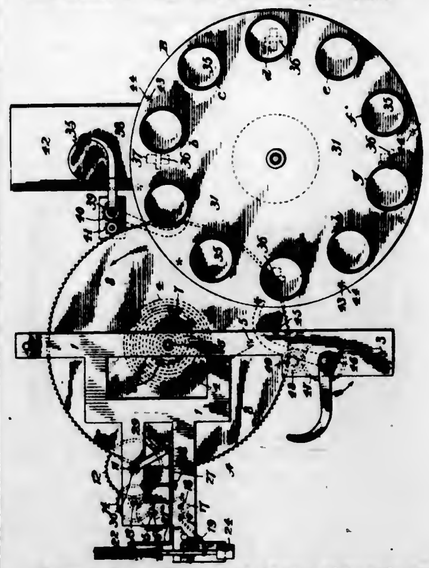
5. In a strainer, a funnel-shaped portion, a circular portion, at the bottom of the funnel-shaped portion having a number of openings in it, a woven-wire screen in each of these openings, a bottom connected with the lower end of the circular portion, a funnel-shaped screen inverted and placed upon the bottom, comprising two circular bands, bands connecting the upper and lower circular bands, and a wire between said upper and lower bands.

811,755. **HARNESS-FASTENER.** THOMAS WRIGHT, Mountainview, Wyo., assignor of one-half to James Perry, Mountainview, Wyo. Filed July 21, 1905. Serial No. 270,720.

Claim.—A harness-fastener comprising a body portion designed to be secured to one of the parts to be fastened together and provided at its outer end with a curved arm, an eye member pivotally secured to said body portion and of such length that its eye will project partially beyond the curved arm when in registry therewith, the body portion being further provided with a notch at one side of the curved arm and connecting therewith whereby the eye member may be turned out of registry with said arm to expose its entire eye, and a stud designed to be secured to the other part to be fastened, the said stud being provided with a head of a diameter to pass through said eye, and of a diameter larger than the partially-exposed portion thereof, when the latter is in registry with the said arm



811,756. **AUTOMATIC VENDING-MACHINE.** GEORGE C. YOCUM, Scranton, Pa. Filed Oct. 28, 1904. Serial No. 230,346.



Claim.—1. The combination with a motor, and means for starting and stopping the same, of a movable magazine-carrier having a series of magazines thereon and supporting means, movable with the carrier, for supporting articles in the magazines, a delivery device operated by the motor and arranged to remove an article from one of said magazines while the carrier is stationary, and mechanism operated by said motor for moving the carrier intermittently to bring the magazines successively into operative relation to said delivery device.

2. The combination with a motor, and means for starting and stopping the same, of a movable magazine-carrier having a series of magazines thereon and supporting means, movable with the carrier, for supporting articles in the magazines, a delivery device and means for moving said device to eject an article from one of said magazines each time the motor is started into operation, and while the carrier is stationary, and a feeding device arranged to operate said carrier one step after the delivery device has operated two or more times.

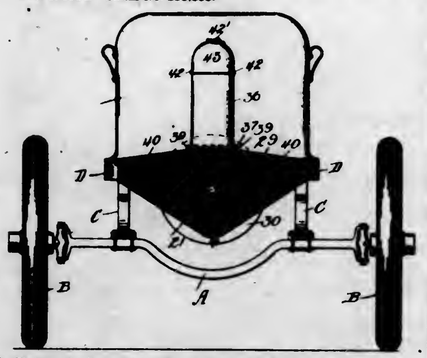
3. The combination with a motor comprising an operating-gear, and means for stopping and starting the motor, of a magazine-carrier having a series of magazines thereon and supporting means, movable with the carrier, for supporting articles in the magazines, a delivery-arm geared to said operating-gear and arranged to pass between the magazine and said supporting means to remove an article from said magazine while the carrier is stationary, and a feeding device geared to said operating-gear and arranged to move the carrier intermittently.

4. The combination with a motor having an operating-gear, and means for stopping and starting the motor, of a rotatable magazine-carrier arranged adjacent to said gear and having a series of magazines thereon and means, movable with said carrier, for supporting articles in the magazines, an article-delivery arm driven by said gear and arranged to pass between said magazines and supporting means to remove articles from the magazines, and an arm operated by said gear and arranged to move the magazine-carrier intermittently.

5. In an automatic vending-machine, a magazine-carrier comprising a horizontally-arranged rotatable table, a series of magazines supported above and rotatable with said table, a rotatable delivery-arm arranged to pass between said table and the lower ends of said magazines, a rotatable feed-arm arranged to move said table intermittently and a motor for operating said delivery and feed arms.

6. In an automatic vending-machine, the combination with a motor, of a magazine-carrier comprising a horizontally-arranged centrally-pivoted table, a disk or spider rotatable with the table and having a circular series of magazines secured thereto and supported with their lower ends a short distance above the table, a corresponding series of pins or studs secured to said table, a feed-arm operatively connected to the motor and adapted to engage said studs successively, and a delivery-arm operatively connected to the motor and adapted to pass between the table and the lower ends of the magazines.

811,757. GAS-ENGINE. Vincent G. Apple, Dayton, Ohio. Filed Dec. 5, 1904. Serial No. 235,563.



Claim.—1. In combination, vertical engine-cylinders, supports therefor laterally extended beyond the engine-cylinders, an engine-crank below the top of said supports, valve-gearing above the engine-cylinders, a sheathing for the cylinders, a canopy arranged when in normal position to constitute a continuation of the sheathing and movable to give access to the valve-gearing, and doors arranged when closed to constitute a continuation of the cylinder-sheathing disposed to overlie the laterally-extended portions of the supports.

2. In combination, vertical engine-cylinders, supports therefor, valve-gearing above the engine-cylinders, a water-jacket sheathing for the cylinders, and a movable canopy arranged when in normal position to constitute a continuation of the sheathing and movable to give access to the valve-gearing.

3. In combination, vertical engine-cylinders, separated supports therefor laterally extended beyond the cylinders, mechanism appurtenant to the engine disposed above the engine-cylinders, mechanism appurtenant to the engine disposed between the said supports, a sheathing for the cylinders, a canopy arranged when in normal position to constitute a continuation of the sheathing and movable to give access to the mechanism above the cylinders, and doors arranged when closed to overlie the engine-supports, said canopy-doors and sheathing constituting the exterior of the engine.

4. In combination, a frame, supports bridging the frame, a vertical engine-cylinder supported centrally on the frame, the engine-crank below the top of the frame, and doors arranged when closed to constitute covers for the supports between the engine-cylinders and the supporting-frame.

5. In combination, a frame, supports bridging said frame, a gas-engine cylinder supported centrally of said frame, the engine-crank below the top of the support, valve-gearing above the engine-cylinder, and an inclosure for the engine parts comprising an immovable central sheathing structure constituting part of the cylinder water-jacket, and movable doors arranged when closed to constitute continuations of the sheathing and when open to give access to the engine-crank and to the valve mechanism.

6. In combination, a vertical-cylinder engine, a frame and trusses for supporting said engine in the frame, one of said trusses comprising a bridge-piece extending from one side of the frame to the other, a truss member therebelow, and a strut member connecting said bridge and truss members.

7. In combination, the vertical cylinders of a gas-engine, the crank-shaft therefor, a frame and truss members for supporting the engine in said frame, each comprising a bridge member spanning the frame from side to side, a truss member therebeneath, a strut member connecting the bridge and truss members and affording support to the crank-shaft.

8. In combination, an engine-cylinder having a gas-duct therefor, of a supporting-frame for the cylinder comprising a member having integrally formed therein a passage arranged for communication with the gas-duct of the engine-cylinder to form a continuation therefor.

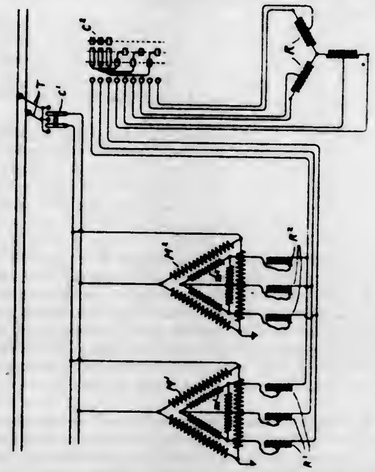
9. In combination, a gas-engine cylinder, gas inlet and outlet ducts associated with said cylinder, a frame, and means for supporting said cylinder in the frame, having formed integrally therein passages for communication with the inlet and outlet ducts of the engine-cylinder to constitute continuations thereof.

10. In combination, a vertical-cylinder engine, a supporting-frame therefor, a crank-casing in the frame open at its rear end only, a crank-shaft within the casing, and a fan fly-wheel arranged adjacent the open end of the casing and disposed to propel air away from the open end of said casing.

11. In combination, an engine comprising a cylinder, a crank and a removable piston, a casing for the crank comprising a door arranged and adapted to permit the removal of the piston.

12. In combination, an engine comprising a cylinder, a crank, a sectional piston-rod, the parts whereof are separately connected, the piston and its associated piston-rod part being fashioned to permit their removal from the cylinder without disturbing the crank, and a casing for the crank comprising a door arranged and adapted to permit the removal of the said piston.

811,758. INDUCTION-MOTOR CONTROL. Albert H. Armstrong, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed June 26, 1905. Serial No. 267,341.



Claim.—1. In combination with a vehicle, a plurality of induction-motors mechanically connected to the driving-wheels of said vehicle, means under the control of the motorman for controlling said motors simultaneously, and means for adjusting the relative torques of said motors.

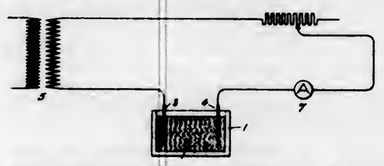
2. In combination with a vehicle, a plurality of induction-motors mechanically connected to the driving-wheels of said vehicle, means under the control of the motorman for controlling said motors simultaneously, and means for adjusting independently the relative resistances of the secondary circuits of said motors.

3. In combination with a vehicle, a plurality of induction-motors mechanically connected to the driving-wheels of said vehicle, a controlling-switch adapted to vary simultaneously the resistances in the secondary circuits of said motors to control the speed of the vehicle, and means for adjusting independently the relative resistances in the secondary circuits of said motors to vary the relative speed-torque characteristics of said motors.

4. In combination with a vehicle, a plurality of induction-motors mechanically connected to the driving-wheels of said vehicle, a switch under the control of the motorman for controlling said motors simultaneously, and independent adjustable resistances placed near the several motors and connected in their secondary circuits.

5. In combination with a vehicle, a plurality of induction-motors mechanically connected to the driving-wheels of said vehicle, the secondary windings of the several motors being connected electrically in parallel, a controlling-switch in the secondary circuit adapted to vary the resistance therein, and independent adjustable resistances connected in series with the several rotor-windings respectively.

811,759. ELECTRODEPOSITION. William C. Arsem, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed July 25, 1904. Serial No. 218,097.



Claim.—1. The process which consists in passing an alternating current between electrodes in an electrolyte to deposit a coherent coating of metal from said electrolyte.

2. The process which consists in passing an alternating current through a solution to deposit a coherent coating of uncombined metal from said solution.

3. The process of electroplating, consisting in passing an alternating current through an electrolyte by means of suitable electrodes, to deposit an uncombined metal in coherent form from the electrolyte, on an electrode.

4. The process of electroplating, consisting in passing an alternating current through an aqueous solution of a metal by means of suitable electrodes, to deposit on said electrodes a coherent coating of metal from said solution.

5. The process of electroplating, consisting in passing an alternating current through an aqueous solution of platinum by means of suitable electrodes, thereby depositing platinum from the solution.

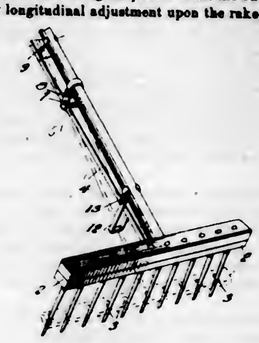
6. The process of electrodeposition, consisting in passing an alternating current through an electrolyte thereby depositing a metal, said electrolyte being such that the negative radical liberated by the current will not substantially corrode the deposited metal.

7. The process of electrodeposition, consisting in passing an alternating current between electrodes immersed in an electrolyte containing a metal, thereby depositing metal from the electrolyte on the electrodes, said electrolyte being such that the negative radical liberated by the current will not substantially corrode the deposited metal.

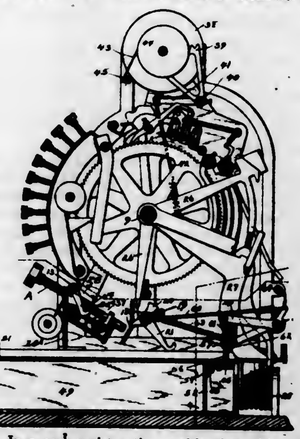
8. The process of electrodeposition, consisting in passing an alternating current between electrodes immersed in a solution of a platinum salt, thereby depositing platinum, said solution being such that the negative radical liberated by the current will not substantially corrode the deposited metal.

811,760. RAKE ATTACHMENT. Frank X. Berkele, Jr., Hiteman, Iowa. Filed Oct. 16, 1905. Serial No. 283,047.

Claim.—The combination of a rake, a clearing-plate operating upon the teeth thereof, an operating-lever connected to the clearing-plate and provided at an intermediate point with a fulcrum-block, a U shaped clip fitting around the rake-handle and having the fulcrum-block pivoted between its arms, a coil-spring interposed between the end of the operating-lever and the rake-handle, said spring being connected at one end to a thimble fitting over the extremity of the operating-lever while its opposite end is connected to a spring clamping member which engages with the rake-handle, and a guide and stop member fitting around a portion of the operating-lever adjacent the clearing-plate and being adapted to limit the outward throw of the latter by longitudinal adjustment upon the rake-handle.



811,761. CASH-REGISTER. William F. Bockhoff, Indianapolis, Ind., assignor to National Cash Register Company, Jersey City, N. J., a Corporation of New Jersey. Filed Jan. 19, 1898. Serial No. 702,651.



Claim.—1. In a cash-register, the combination with a framework, and a sliding drawer therein having separate compartments, of a sliding cover-plate for each of said compartments; mechanism whereby the opening of the drawer results in the cover-plate of one of said compartments moving outward with the drawer and the cover-plate of the remaining compartment remaining in its inner position; and independent means common to all of said cover-plates for simultaneously exposing all of said compartments upon the opening of the drawer.

2. In a cash-register, the combination with a movable money-repository divided into compartments and designed to be moved to open position at each operation of the machine, of guarding means normally closing said compartments and adjustable to expose the same singly when the repository is opened; selective manipulating devices for the machine allotted to the different compartments with provisions for automatically determining which one of the same shall be exposed in an operation of the register; and means common to all of said guarding means for effecting the exposure of all of said compartments upon the operation of the register.

3. In a cash-register, the combination with a sliding money-repository divided into compartments, of separate covers for the compartments; means for locking the covers; selective manipulating devices for the machine with provisions for unlocking a certain cover to predetermine which compartment shall be exposed when the repository slides to open position in any operation of the machine; and means common to all of said covers for simultaneously unlocking all of the same to expose all of the compartments upon the attendant operation of the machine.

4. In a cash-register, the combination with a drawer divided into a series of separate compartments, of a series of independent

covers therefor; a series of independent pins arranged each to engage one of said covers; and means for throwing all of said pins into engagement with their covers whereby all of the compartments may be simultaneously uncovered.

5. In a cash-register, the combination with a plurality of receptacles, of a plurality of registering mechanisms; a series of special keys for predetermining which receptacle shall be exposed and for controlling the operation of the corresponding registering mechanism; a series of amount-keys common to all of said registering mechanisms; and interlocking means between said amount-keys and said special keys.

6. In a cash-register, the combination with a plurality of receptacles, of a plurality of registering mechanisms; a series of special keys for predetermining which receptacle shall be exposed and for controlling the operation of the corresponding registering mechanism; a series of amount-keys common to all of said registering mechanisms; and locking means for the special keys controlled by said amount-keys.

7. In a cash-register, the combination with a plurality of receptacles, of a plurality of registering mechanisms; a series of special keys for predetermining which receptacle shall be exposed and for controlling the operation of the corresponding registering mechanism; a series of amount-keys common to all of said registering mechanisms; interlocking means between said amount-keys and said special keys; and an auxiliary key for disabling said interlocking means.

8. In a cash-register, the combination with a plurality of receptacles, of a plurality of registering mechanisms; a series of special keys for predetermining which receptacle shall be exposed and for controlling the operation of the corresponding registering mechanism; a series of amount-keys common to all of said tegistering mechanisms; means for locking said special keys until one of said amount-keys has been operated; and an auxiliary special key for operating said lock independently of the amount-keys.

9. In a cash-register, the combination with a cash-drawer divided into a series of compartments, a series of covers for said compartments, a series of registering mechanisms corresponding to said compartments, a series of amount-keys common to said registering mechanisms, and a series of special keys for predetermining which compartment shall be exposed and for controlling the operation of the corresponding registering mechanism; of means for locking said special keys until one of said amount-keys has been operated; and an auxiliary special key for disabling said lock and permitting the exposure of any desired compartment without the attendent operation of any registering mechanism.

10. In a cash-register, the combination with a sliding drawer having separate compartments, of a sliding cover-plate for each of said compartments; a series of special keys for predetermining which compartment shall be exposed; a rocking lever pivoted in proximity to the end of each special key; a plunger positioned over the rear end of each cover-plate to engage an aperture formed in said cover-plate; a latch for each cover-plate for latching the plate to the cash-drawer and positioned in proximity to said aperture so as to be engaged by said plunger to unlatch said cover-plate from the cash-drawer; and intermediate connections between said rocking lever and said plunger for forcing said plunger through said aperture and tripping said latch upon the operation of the corresponding special key.

11. In a cash-register, the combination with a sliding drawer having separate compartments, of a sliding cover-plate for each of said compartments; a series of special keys for predetermining which compartment shall be exposed; a rocking lever pivoted in proximity to the end of each special key; a plunger positioned over the rear end of each cover-plate to engage an aperture formed in said cover-plate; a latch for each cover-plate for latching the plate to the cash-drawer and positioned in proximity to said aperture so as to be engaged by said plunger to unlatch said cover-plate from the cash-drawer; intermediate connections between said rocking lever and said plunger for forcing said plunger through said aperture and tripping said latch upon the operation of the corresponding special key; and a drawer-latch having an operating member extending into position to be engaged and operated by any one of said rock-levers upon the operation of any one of the special keys.

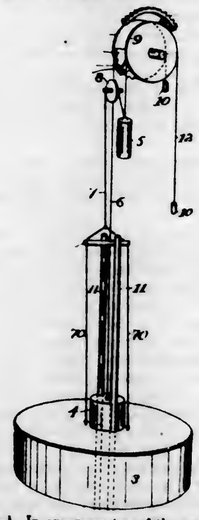
12. In a cash-register, the combination with a sliding drawer having separate compartments, of a sliding cover-plate for each of said compartments; a series of special keys for predetermining which compartment shall be exposed; a rocking lever pivoted in proximity to the end of each special key; a plunger positioned over the rear end of each cover-plate to engage an aperture formed in said cover-plate; a latch for each cover-plate for latching the plate to the cash-drawer and positioned in proximity to said aperture so as to be engaged by said plunger to unlatch said cover-plate from the cash-drawer; intermediate connections between said rocking lever and said plunger for forcing said plunger through said aperture and tripping said latch upon the operation of the corresponding special key; and a common rock-shaft having arms attached thereto for simultaneously operating all of said intermediate connections to carry all of said plungers through said apertures.

13. In a cash-register, the combination with a plurality of receptacles, of a series of special keys for predetermining which receptacle shall be exposed; locking means for normally locking said special keys; a series of amount-keys with connections for operating said locking means to unlock said special keys; and an auxiliary key for operating said locking means to release said special keys independently of said amount-keys

14. In a cash-register, the combination with a cash-drawer divided into a series of compartments, of a series of clerks' keys for predetermining which compartment shall be exposed; locking means for normally locking said clerks' keys; a series of amount-keys with connections for unlocking said clerks' keys; means connected with said clerks' keys for unlocking said cash-drawer; and a "change" key and connections for unlocking said clerks' keys independently of said amount-keys.

15. In a cash-register, the combination with a plurality of cash-receptacles, of a series of special keys for predetermining which receptacle shall be exposed; a rock-shaft carrying pawls for normally locking said special keys; a series of amount-keys; connections between said amount-keys and said rock-shaft for unlocking said pawls upon the operation of any amount-key; and an auxiliary key and connections for rocking said shaft independently of said amount-keys whereby to unlock said special keys

811,762. **TIDE POWER.** RUFUS B. CADE, Seattle, Wash. Filed Dec. 10, 1904. Serial No. 236,304.



Claim.—1. In an apparatus of the type set forth, a float, two power-weights, one of said weights being directly engaged by the float to be lifted, an elevated guide, a flexible connection between said float and other weight passing over said guide, and mechanism operated by said weights.

2. In an apparatus of the type set forth, a shaft, a float, two power-weights, one of said weights being directly engaged by the float to be lifted, an elevated guide, a flexible connection between said float and other weight passing over said guide, and means whereby said shaft is rotated during the raising and lowering of said weight

3. In an apparatus of the type set forth, a rotatably-supported shaft, two drive-wheels having releasable driving connections with said shaft, a flexible means passing over one of said drive-wheels, a power-weight connected to said means at one side of said last drive-wheel, a take-up weight on said means at the opposite side of said drive-wheel, a float for raising said power-weight, means whereby said power-weight will lower independently of the float, and means for rotating the other drive-wheel with the shaft during the upward movement of said power-weight

4. In an apparatus of the type set forth, a rotatably-supported shaft, a float, two drive-wheels having releasable driving connections with said shaft, an elevated guide, two power-weights, a flexible connection between said float and one of said weights passing over said guide, the other of said weights being directly engaged by said float to be lifted, and means connected with said weights for rotating said drive-wheels alternately in a common direction during movement of said weights in one direction.

5. In an apparatus of the type set forth, a rotatably-supported shaft, a float, two drive-wheels having releasable driving connection with said shaft, a power-weight engaging said float to be lifted, a flexible means connected to said weight and passing over one of said drive-wheels, an elevated guide, a flexible means secured to said float and passing over said elevated guide and the other drive-wheel, a power-weight secured to said last flexible means intermediate said guide and drive-wheel, and take-up weights on the free ends of said flexible means.

6. In an apparatus of the type set forth, a rotatably-supported shaft, two drive-wheels having releasable driving connections with said shaft, a float, guides for the float, a weight engaging on said float between said guides, a flexible means connected to said weight and passing over one of said drive-wheels, a flexible means passing over said other drive-wheel and having connection with the float, and means whereby said last-named drive-wheel is operated with the shaft as the float rises.

7. In an apparatus of the type set forth, a float, two power-weights, one of said weights being controlled to be directly engaged by the float to be lifted, an elevated guide, a flexible means connecting the float and other weight and passing over said elevated guide, a motor mechanism operated by the respective weights alternately, and a device for controlling the speed of the motor and reduce the rate of fall of the weights to less than that of the float.

8. In an apparatus of the type set forth, a rotatably-supported shaft, two drive-wheels having releasable driving connections with said shaft, a float, two power-weights, one of said weights engaging said float to be lifted, a flexible means connected to said weight passing over one of said drive-wheels, an elevated guide, and a flexible means secured to the other power-weight and passing over the other drive-wheel and guide and having one of its end portions divided into two branches and secured to the float on opposite sides of said first weight.

9. In an apparatus of the type set forth, two power-weights, one of said weights being controlled to be directly engaged by the float to be lifted, an elevated guide, a flexible means connecting the float and other weight and passing over said elevated guide, a motor mechanism containing two drive-wheels having releasable driving connection with the rest of the mechanism, a flexible means extending from each weight over its respective drive-wheel, and take-up weights connected with the free ends of said last flexible means.

811,763. **STREET CONNECTION FOR PITOMETERS.** JOHN A. COLE, Chicago, Ill. Filed Apr. 19, 1905. Serial No. 256,466.

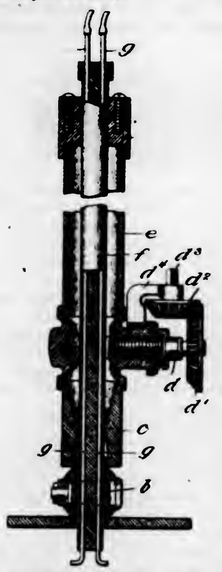
Claim.—1. The combination with a liquid-conduit, of a pipe or passage extending from the surface of the ground and communicating with the interior of said conduit, a pitometer extending through said pipe or passage into said conduit, means for closing the top of the said pipe or passage against the pitometer, and a valve for closing said pipe or passage on the withdrawal of the pitometer, substantially as described.

2. The combination with a water main or pipe, of a pipe or passage extending from the surface of the ground and communicating with the interior of said main, and a pitometer extending through said pipe or passage into said main, said construction including a means for guiding the pitometer centrally through the pipe or passage when inserting the same, substantially as described.

3. A street connection for applying a pitometer to a water main or pipe comprising a casing extending from the main or pipe to the surface of the ground, and a valved pipe or passage within the same connected with the interior of the main, capable of admitting a pitometer, said pipe or passage being provided with a valve for opening and closing said passage and a guiding portion for directing the pitometer in inserting the same, substantially as described.

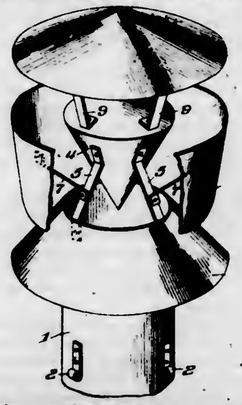
4. In a street connection for applying a pitometer to a water main or pipe, the combination with the tap, of the valve, the guiding-section, the pipe connection above these and the stuffing-box, substantially as described.

5. In a street connection for applying a pitometer to a water main or pipe, the combination with a water main or pipe, of a pipe or passage extending from the surface of the ground to the said water main or pipe, said pipe or passage being provided with a valve to open the same for the admission of a pitometer and to close it on the removal thereof, of a stuffing-box at the upper end of said pipe or passage, a casing inclosing said pipe or passage, a detachable cover for closing the upper end of said pipe or passage when there is no pitometer passing through the stuffing-box and a detachable cover for closing the upper end of said casing above the upper end of said pipe or passage, substantially as described.



6. A street connection for applying a pitometer to a water main or pipe, comprising a casing from the main or pipe to the surface of the ground, a pipe or passage within the same connecting with the interior of the main or pipe, said pipe or passage being provided with a valve for opening and closing the same, and guiding means for directing the pitometer in inserting the same, substantially as described.

811,764. **CHIMNEY-CAP.** AUSTIN E. COLBGROVE and SHELTON REED, Cynthiana, Ky. Filed Feb. 15, 1906. Serial No. 345,727.



Claim.—A chimney-cowl substantially as described and comprising the collar 1, the loop members 2 exterior of the collar 1, the deflecting-frustum 3 at the upper extremity of the collar 1, the upward-flaring band 6 above the frustum 3 and having its smaller end

lowermost, the rods or bars 5 projected upwardly from the upward

9. In an air-brake system, an independent source of compressed

lowermost, the rods or bars 5 projected upwardly from the upward extremity of the collar 1, the deflecting-cone 4 exposed above the collar 1 and encircled by the band 6, the rods or bars 7 attached at their lower ends to the rods or bars 5 between the ends of the latter and secured at their upper ends to the band 6 aforesaid to support the same, the hollow top 8 above the cone 4, and the rods or bars 9 attached at their lower ends to the top of the cone 4 and at their upper ends to the under side of the hollow top, supporting the latter.

811,765. AIR-BRAKE SYSTEM AND AUTOMATIC VALVE. FRED B. COREY, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed Sept. 16, 1904. Serial No. 224,651.

Claim.—1. In combination with a train of cars, an independent source of compressed air on each car, a control-pipe extending through the train, and an automatic valve on each car responsive to variations in the pressures both in the control-pipe and in the brake-cylinder, and adapted to connect the brake-cylinder to the source of pressure or to atmosphere.

2. In combination with a train of cars, an independent source of compressed air on each car, a control-pipe extending through the train, and an automatic valve on each car connected to said control-pipe and adapted to connect brake-cylinder to the source of pressure or to atmosphere, said valve being arranged to return to lap position when the pressures in control-pipe and brake-cylinder bear a predetermined relation to each other.

3. In a train of cars, an independent source of compressed air on each car, a control-pipe extending through the train, an automatic valve on each car responsive to variations of the pressures in both the control-pipe and the brake-cylinder and adapted to establish connections for applying and releasing the brakes, and means for raising and lowering the pressure in the control-pipe.

4. In a train of cars, an independent source of compressed air on each car, a control-pipe extending through the train, an automatic valve on each car comprising a movable member and a valve controlled thereby adapted to establish connections for applying and releasing the brakes, means for impressing on said member two forces tending to move it in the same direction and proportional respectively to the pressure in the control-pipe and in the brake-cylinder, means for impressing on said member a substantially constant opposing force, and means for raising and lowering the pressure in the control-pipe.

5. In a train of cars, an independent source of compressed air on each car comprising two reservoirs, a control-pipe extending through the train, a manually-controlled valve connecting one of said reservoirs to said control-pipe, an automatic valve connected to the control-pipe and adapted to connect brake-cylinder to the second reservoir or to atmosphere, and means for preventing a flow of air from the second to the first reservoir.

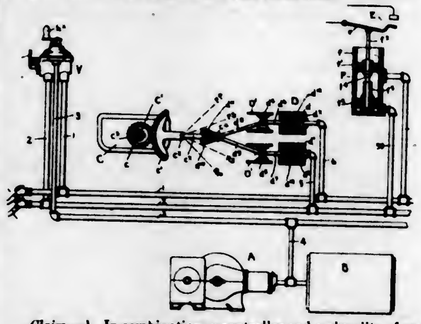
6. In a train of cars, an independent source of compressed air on each car comprising two reservoirs, a control-pipe extending through the train, a manually-controlled valve connecting one of said reservoirs to said control-pipe, an automatic valve connected to the control-pipe and adapted to connect brake-cylinder to the second reservoir or to atmosphere, and a check-valve inserted in the connection between the two reservoirs.

7. In a train of cars, a control-pipe extending through the train, a movable member responsive to variations in pressure in both the control-pipe and the brake-cylinder, two relay-valves arranged to be operated respectively by the movement of said member in one direction or the other, and two valves controlled by said relays and adapted and arranged to establish connections respectively for applying and for releasing the brakes.

8. In an air-brake system, a control-pipe extending through the train, two rigidly-connected diaphragms, connections from the brake-cylinder to one side of one diaphragm, connections from the control-pipe to the corresponding side of the other diaphragm, means for impressing a substantially constant opposing force on said diaphragms, two relays arranged to be operated respectively by the movement of said diaphragms in one direction or the other, and two valves controlled by said relays and adapted and arranged respectively to establish connections for applying and for releasing the brakes.

9. In an air-brake system, an independent source of compressed air on each car, a control-pipe extending through the train, two rigidly-connected diaphragms, connections from brake-cylinder to one side of one of said diaphragms from said control-pipe to the corresponding side of the other diaphragm, means for impressing a substantially constant opposing force on said diaphragms, two relay-valves arranged to be operated respectively by the movement of said diaphragms in one direction or the other, and two valves controlled by said relays and arranged respectively to connect brake-cylinder to said source of pressure and to atmosphere.

811,766. SYSTEM OF MOTOR CONTROL. FRED B. COREY, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed Oct. 1, 1904. Serial No. 226,754.



Claim.—1. In combination, a controller and a plurality of operating devices therefor acting thereon in succession, the direction of movement of the controller being determined by the order in which said operating devices are actuated.

2. In a system of motor control, a switch for determining the direction in which current passes through the motors and for controlling the series and parallel motor connections, a plurality of operating devices therefor acting thereon in succession to produce successively series and parallel motor connection, the order in which said operating devices are actuated determining the direction of rotation of the motors.

3. In a system of motor control, a switch for determining the direction of passage of current through the motors and for controlling the series and parallel motor connections, duplicate operating devices, acting successively upon the switch to produce the series and parallel connections of the motors, the order in which said operating devices are actuated determining the direction of the flow of current through the motors.

4. In a system of motor control, a controlling-switch for determining the direction of flow of current through the motors and for controlling the series and parallel connections of the motors, a pair of pneumatically-actuated devices associated with each switch for operating the same, two pipes communicating with said pairs of operating devices, and means for connecting said pipes successively with a source of compressed-fluid supply.

5. In a system of motor control, a controlling-switch, a pair of pneumatically-actuated devices associated with said switch for operating the same, two train-pipes communicating with said pair of operating devices, and means for energizing said train-pipes successively, the order in which the train-pipes are energized determining the direction of movement of the car or train.

6. In a system of motor control, a controller, a pair of operating devices associated with said controller, and means for actuating said operating devices successively, the direction of movement of the train being determined by the order in which said operating devices are actuated.

7. In a system of motor control, a controller, a pair of operating devices for said controller, their successive operations serving to move the controller respectively to series and parallel positions and the direction of movement of the train being determined by the order in which said controller-operating devices are applied.

8. In a system of motor control, a motor-circuit, a controller therefor, a pair of operating devices for the controller, either of said operating devices serving to move the controller to series position and the other to move it to parallel position, the direction of movement of the train being determined by the order in which the operating devices are applied.

9. In a system of motor control, a motor-controller, a pair of operating devices for said controller, either of said operating devices serving to move it to series position and the other to move it to parallel position, the direction of movement of the car or train being determined by the order in which the operating devices are applied, and means for controlling said operating devices from a single point.

10. In a system of control, a motor-circuit and an oscillating controller therefor, a pair of pistons or diaphragms, chambers in which said pistons or diaphragms are mounted, means for admitting compressed fluid to said chambers in succession and connection between said controller and the piston or diaphragms such that the controller is oscillated in one direction or the other, according to the order in which compressed fluid is supplied to said chambers.

11. An oscillating driven member, a pair of reciprocatory driving members therefor and connections between the driven member and the driving members such that the driven member is oscillated in one direction or the other depending upon the order in which said driving members are applied.

12. An oscillating driven member, a pair of reciprocatory driving members arranged to operate in succession upon said driven member to give it successive movement in the same direction, and connections between said driving and driven members whereby the reversal of the order in which the driving members are operated reverses the direction in which the driven member is oscillated.

13. In combination, an oscillating driven member, a pair of reciprocatory driving members, a slotted link pivoted to each driving member, and a projection from the driven member extending through the slots in said links.

14. In combination, an oscillating driven member, a pair of reciprocatory driving members having paths of movement on opposite sides of the axis of the oscillating members, a slotted link pivoted to each driving member, and a projection from the driven member extending through the slots in said links.

15. In combination, an oscillating driven member, a pair of reciprocatory driving members having paths of movement on opposite sides of the axis of the oscillating member, a slotted link pivoted to each driving member, and a projection from said reciprocatory member extending through the slots in said links and located near the inner ends of said slots when the parts are in their inoperative positions.

16. In a control system, a circuit-closing switch, a plurality of superimposed pistons or diaphragms operatively related thereto, a plurality of pipes, and operative connection between said pistons and said pipes whereby pressure in either pipe moves a piston to close said switch.

17. In a control system, a circuit-closing switch, a chamber, a plurality of pistons or diaphragms associated therewith and operatively related to said switch, a plurality of pipes opening into said chamber upon corresponding sides of said pistons or diaphragms, and means for admitting compressed fluid to said pipes.

18. In a control system, a circuit-closing switch, a chamber, a plurality of independent pistons or diaphragms associated therewith one of which pistons or diaphragms is operatively related to said switch, a stop for limiting the movement of the pistons or diaphragms toward each other, and means for admitting compressed fluid to either of said pistons or diaphragms.

811,767. BRACELET. EMIL DREWS, Pforzheim, Germany. Filed Nov. 23, 1904. Serial No. 234,567.

Claim.—1. A device having securing members thereon, an adjustable band and means on the band whereby said band, device and means coöperate to hold the device in position on the band, said means engaging the securing members and the band sliding through the means.

2. A flexible band and a device to be secured thereto and provided with securing members, in combination with members one of which is connected to one end of the band and the other slidable thereon, said last-named members adapted to engage the securing members.

3. A device having securing members thereon, a flexible band, a member hinged to one end of the band and a similar member free to slide on the band and said last-named members engaging the securing members, whereby said device, members and band coöperate to hold the device in position on the band.

4. A bracelet comprising a flexible band, an ornament, and means locking the ornament to the band and necessitating flexure of the latter and rotation of the ornament to disconnect the same from the band.

5. A bracelet comprising a flexible band, an ornament, and means locking the ornament to the band and necessitating flexure of the latter and rotation of the ornament to disconnect the same from the band; in combination with means for adjusting and locking the band to the arm.

6. A bracelet comprising a flexible band, an ornament of greater width than the width of said band, locking devices for detachably locking the ornament to the band consisting of membrs on the band and ornament coöperating to hold the latter in contact with the band and to require flexure of said band and rotation of the ornament to disengage the latter from the locking members on the band.

7. A bracelet comprising a band, and locking devices for locking an ornament thereto so organized as to require rotation of said ornament to disengage the same from the locking members on the band and thereby release the slidable member, said devices consisting of two locking members on the band, one of which is slidable thereon, and coöperating locking members on the ornament.

8. The combination with an ornament having T-shaped members thereon, a band and two locking members thereon having T-shaped slots, said band passing through the head of the slots and the members held in the stem of the slots.

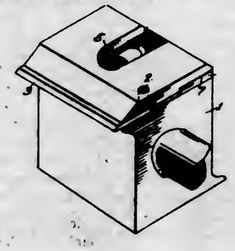
9. The combination with an ornament having T-shaped members thereon, a band, two locking members having T-shaped slots, and one of them secured to one end of the band and the other adapted to slide on the band, said band passing through the heads of the slots, and a clasp to fasten the free end of the band to its body.

811,768. PLANER-HEAD AND CUTTER. JOHN B. FORBES, Mill Valley, Cal. Filed July 1, 1904. Serial No. 215,032.

Claim.—1. A planer-head for woodworking, comprising a cylinder provided with deep peripheral grooves spaced widely apart and having walls of unequal depth, in combination with cutters, a wedge or key in each groove of substantially the depth of one wall, but of less depth than the other, and screw-bolts for securing said wedges passing substantially tangentially from the periphery of the head through the wall of greater depth to press said key against the cutter; all constructed and arranged to provide a wide clearance-space or throat between the cutter and the junction of the deeper wall with the periphery of the head.

2. A planer-head for woodworking, comprising a cylinder, having deep peripheral grooves spaced widely apart and having walls of unequal depth relatively to the periphery of the cylinder, the deeper wall converging outwardly toward the other wall to form a dovetail seat and then extending to the periphery tangentially, in combination with a cutter, a wedge or key in each dovetail seat, and screw-bolts for securing said wedges; all constructed and arranged to provide a wide clearance-space or throat between the cutter and the junction of the angular wall with the periphery of the head.

811,769. PLANER-HEAD. JOHN B. FORBES, San Francisco, Cal. Filed July 6, 1905. Serial No. 268,343.



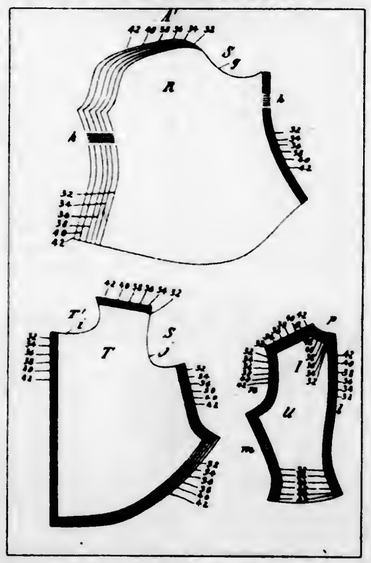
Claim.—1. In a planer-head, a cap, the rear edge of which is re-

terns for the back being nested in such a manner that the side lines,

Claim.—1. In a planer-head, a cap, the rear edge of which is recessed longitudinally upon its under surface and shouldered, and a support for engaging with the bit and holding it in position, the rear edge of the support being thicker than the forward edge and provided with shoulders for engaging with the shoulders of the cap.

2. In combination with a planer-head, a cap having a recess in its rear edge, means for securing the cap to the head, a bit held between the forward parts of said cap and head and a block held between the rear parts of said parts so that the bit will abut against the forward edge thereof, said block having a thickened rear part adapted to engage with the recessed part of the cap, said thickened part and the recessed part being corrugated, the corrugations engaging with each other.

811,770. **PRINTED DRESS-PATTERN.** WILLIAM FREEMAN, New York, N. Y. Filed July 2, 1904. Serial No. 215,191.



Claim.—1. A base having printed thereon a set of patterns of graduated sizes for a sleeve; said patterns being nested in such a manner that the distinguishing-lines of each smaller size lie wholly between the lines of the next larger size, and so that the lines extending along one side of the nest continue and form converging shoulder-lines, which merge into a single armpit-line.

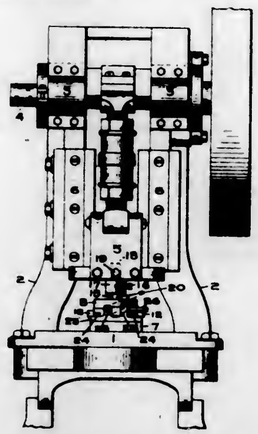
2. A base having printed thereon a set of patterns of graduated sizes for the front of a dress-waist; said patterns being nested in such a manner that the side, top and bottom lines of each smaller size are distinct from and lie wholly between the corresponding lines of the next larger size, and so that all of the patterns coincide or form a single line at both the armpit and the neck.

3. As an article of manufacture a set of patterns of graduated sizes for a dress-waist, comprising patterns for the front of the waist, and patterns for the back of the waist; the front patterns being nested in such a manner that the side, top and bottom lines of each smaller size are distinct from and lie wholly between the corresponding lines of the next larger size, and so that all of the patterns coincide or form a single line at the armpit; and the patterns for the back being nested in such a manner that the side lines, the armpit-liner and the shoulder and neck lines of each smaller size are distinct from and lie wholly between the corresponding lines of the next larger size, and so that all of the patterns coincide or form a single line at the bottom of the waist.

4. As an article of manufacture a set of patterns of graduated sizes for a dress-waist, comprising patterns for the front of the waist, patterns for the back of the waist, and patterns for the sleeve; the front patterns being nested in such a manner that the side, top and bottom lines of each smaller size are distinct from and lie wholly between the corresponding lines of the next larger size, and so that all of the patterns coincide or form a single line at the armpit; the patterns for the back being nested in such a manner that the side lines, the armpit-lines and the shoulder and neck lines of each smaller size are distinct from and lie wholly between the corresponding lines of the next larger size, and so that all of the patterns coincide or form a single line at the bottom of the waist; and the sleeve-patterns being nested in such a manner that both side lines of each smaller size are distinct from and lie wholly between the side lines of the next larger size, and so that the side lines in one set continue and form converging shoulder-lines, which merge into a single armpit-line; all of the patterns coinciding or forming a single line at the bottom end of the sleeve.

5. A pattern comprising a base and unsymmetrical demarking-outlines printed thereon; said outlines being broken and spaced to form sections of a complete pattern-outline, whereby said base may be folded or cut in the spaces between the broken lines, and said outlines joined to make a complete pattern-outline; corresponding sets of equally-spaced marks occupying the spaces between the broken sections, for guiding the user in joining the sections.

811,771. **MACHINE FOR SHAPING THE ENDS OF METAL BARS.** HENRY GRIESENBRUCH, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed Sept. 29, 1903. Serial No. 175,204.



Claim.—1. A machine for shaping the ends of metal bars, comprising a shearing-tool, a work-holder adjacent to the line of movement of said tool and having one or more slots transverse to said line of movement, and a work-rest in each slot having its end conforming to the shape of the tool.

2. A machine for shaping the ends of metal bars, comprising a shearing-tool, a work-holder adjacent to the line of movement of said tool and having one or more transverse slots, and a work-rest in each slot having its upper surface inclined slightly upward toward the tool.

3. A machine for shaping the ends of metal bars, comprising a shearing-tool, a work-holder adjacent to the line of movement of said tool having one or more radial slots inclined slightly upward toward the tool, a rest in each slot, and means for clamping the work in said slots.

4. A machine for shaping the ends of metal bars, comprising a shearing-tool, a work-holder adjacent thereto and provided with transverse slots inclined slightly upward toward the tool, a removable rest in each slot having its end conforming to the shape of the tool, and means for clamping the work in said slots.

5. A machine for shaping the ends of metal bars, comprising a shearing-tool, a rotatable work-holder concentric with said tool and having one or more radial slots, and a clamping-screw entering each slot.

6. A machine for shaping the ends of metal bars, comprising a shearing-tool, a rotatable work-holder concentric therewith and having one or more radial slots, and a guide on said holder engaging with said tool to keep it in alinement with said slots.

7. In a machine for shaping the ends of metal bars, the combination with a cylindrical work-holder having radial slots of different sizes, of a shearing-tool having cutting edges corresponding with said slots, and a guide on said cylinder engaging with said tool during its entire stroke to keep it in proper alinement with said slots.

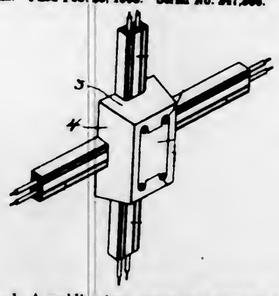
8. In a machine for shaping the ends of metal bars, a work-holder comprising a plate, a cylinder rotatable thereon and having radial slots, and a gage adjustable radially to said cylinder.

9. In a machine for shaping the ends of metal bars, a work-holder comprising a plate, a cylinder rotatable thereon and having radial slots, and a gage adjustable radially to said cylinder and provided with a pivoted slot.

10. In a machine for shaping the ends of metal bars, a gage comprising a block provided with ears, and a stop pivoted to one of said ears for movement into inoperative position and engaging with the other.

11. In a machine for shaping the ends of metal bars, a work-holder comprising a plate having a shallow circular socket at one end and slots parallel with a radius of said socket, a cylinder rotatable in said socket and having radial slots and a circumferential groove, retaining-segments fastened to said plate and projecting into said groove, clamping-screws entering said radial slots, and a gage-block having a pivoted stop and adjustable in said parallel slots.

811,772. **UNIVERSAL MOLDING-BOX.** JOHN L. GLEASON, Boston, Mass. Filed Feb. 25, 1905. Serial No. 247,266.



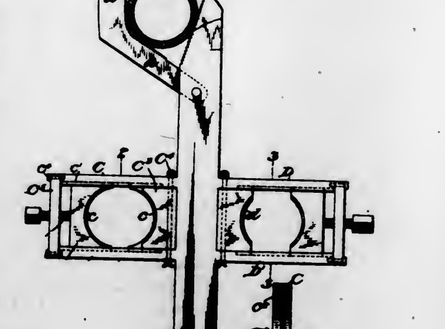
Claim.—1. A molding-box comprising integral metallic bases and sides adapted to be secured externally upon the surface of a wall with one of said bases adjacent the wall, and having openings in its sides for the reception of the ends of electrical wires and moldings, the outer base or front of the box being smaller than the other and the sides convergently inclined with respect thereto, and said outer base having an opening; and a plate or cover extending over said opening flush with said outer base and detachably secured thereto, the plate having an orifice and slots for securing an electrical fixture thereto and permitting passage of wires therethrough.

2. A molding-box comprising integral metallic top or front, bottom and side walls, the top or front being of less area than the bottom or rear and the sides being inclined with relation thereto, converging from bottom to top or front, the box having in its sides openings for the reception of ends of moldings and wires of an exposed wiring system and having also openings in its bottom and top, a plug detachably secured in the opening of the bottom, and a detachable cover secured to the top of the box extending over the opening therein.

3. A molding-box having a metallic integral top, bottom and side walls formed with lateral openings for receiving the ends of wires of an exposed electric wiring system and the top having an opening, and a cover or lid detachably secured to the box and extending over said opening, said cover being formed with a central orifice and slots concentrically and radially arranged with respect to said orifice.

811,773. **SYSTEM OF DISTANT ELECTRICAL CONTROL.** JOSH. GEMMELL, Lynn, Mass., assignor to General Electric Company, a Corporation of New York. Filed Sept. 14, 1904. Serial No. 224,267.

Claim.—1. In a system of distant electrical control, the combination with a movable object, of an electric motor for moving it, a relay controlling the motor and having opposed electromagnets, rheostats respectively in circuit with said magnets, means for simultaneously varying said rheostats in inverse ratio, a rheostat in circuit with both magnets, and means for automatically varying the portion thereof in circuit with each magnet in accordance with the movement of said object, and in inverse ratio to the variation of the aforesaid rheostats.



3. In a system of distant electrical control, the combination with a movable object, of an electric motor for moving it, a relay controlling said motor, two balanced circuits including said relay, means at the controlling-station for unbalancing said circuits, and means operated by the motor for restoring said balance, comprising an indicator at the controlling-station for indicating the position of the movable object.

4. In a system of distant electrical control, the combination with a movable object, of an electric motor for moving it, a relay controlling said motor, two balanced circuits including said relay, means at the controlling-station for unbalancing said circuits, and means operated by the motor for restoring said balance, comprising an indicator at the controlling-station, consisting of a rheostat connected across said circuits, a movable contact therefor, and two solenoids for moving said contact, connected respectively with said circuits.

5. In a system of distant electrical control, the combination with a movable object, of an electric motor for moving it, a switch for reversing said motor, two electromagnets for operating said switch, two parallel conductors each including one of said magnets, two rheostats at the controlling-station, connected with one side of the line, means for simultaneously connecting them inversely with said conductors, a rheostat connected across said conductors, a movable contact therefor connected with the other side of the line, solenoids for moving said contact, each connected with one of said conductors, two rheostats at the working station connected with the same main as those at the controlling-station, and means controlled by the movable object for connecting said rheostats with said circuits in inverse ratio.

811,774. **THREADER AND CUTTER.** WILLIAM C. GRIFFIN, Verdigris, Nebr. Filed Nov. 6, 1903. Serial No. 180,081.

Claim.—A device of the character described, comprising a handle provided with integral laterally-extending fixed members, each having a longitudinal groove in its inner face and a transverse hole, inner and outer dies having lateral projections engaging and slidable in the said grooves the inner die having a hole registering with the holes in the laterally-extending members, a pin C^4 removably engaging said holes, a removable section C^5 connecting the ends of said arms, a threaded hole in said section and a screw E projecting through said hole and arranged to engage with one of said dies for the purpose of adjusting it inwardly, substantially as described.

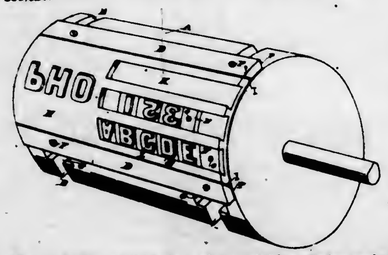
811,775. **AMUSEMENT DEVICE.** ELIOT KEEN and RAYMOND F. AYERS, New York, N. Y. Filed May 8, 1905. Serial No. 259,279.

Claim.—1. In an amusement device, the combination with a slidable hollow body or object a cross-piece the ends of which project beyond the body on both sides and form pivots on which the body turns, of propelling means located in said body and adapted to move therein against the walls thereof to thereby slide said body, substantially as described.

2. In an amusement device, the combination with a slidable hollow body or object, a support for said body and a cross-piece the ends of which project beyond the body on both sides and form pivots on which the body turns, of propelling means located in said body and adapted to move on said support and within and against the walls of said body to thereby slide the body on said support, substantially as described.

3. In an amusement device, the combination with a slidable hollow body or object, a support for said body and a cross-piece the ends of which project beyond the body on both sides and form pivots on which the body turns, of spherical propelling means located therein and adapted to move on said support and within and against the walls of said body to thereby slide the body on the support, substantially as described.

811,776. **INTERCHANGEABLE CURVED TYPE AND PLATE.** HENRY L. KOEHLER, Deer Park, Ky. Filed Mar. 20, 1905. Serial No. 251,087.



Claim.—1. The combination of a revoluble cylinder encircled by mortises, beveled strips having dovetails fitting loosely in the mortises, and a beveled curved plate having on its outer surface, mortises, and beveled curved type and screws and end pieces fitting therein, and means for fastening the strips to the cylinder, all substantially as described.

2. The combination of a revoluble cylinder encircled by mortises, beveled strips having dovetails fitting loosely in the mortises, a beveled curved plate having on its outer surface, mortises, beveled curved type fitting therein, and means for fastening the strips to the cylinder, all substantially as described.

811,777. **ANGLE-MEASURING INSTRUMENT.** ALBERT KÖHLER, Jena, Germany, assignor to The Firm of Carl Zeiss, Jena, Germany. Filed Dec. 28, 1904. Serial No. 238,686.

Claim.—1. A telescopic angle-measuring free-hand instrumen consisting of a telescope, a circular scale rotatable about an axis—which is central to it and fixed relatively to the telescope—and passing through the focus of the telescope transversely to the optical axis, and a director rigidly connected to the scale and subject to an invariable terrestrial force.

2. A telescopic angle-measuring free-hand instrument consisting of a telescope, a transparent circular scale rotatable about an axis—which is central to it and fixed relatively to the telescope—and passing through the focus of the telescope transversely to the optical axis, and a director rigidly connected to the scale and subject to an invariable terrestrial force.

3. A telescopic angle-measuring free-hand instrument consisting of a telescope, a transparent circular scale rotatable about an axis—which is central to it and fixed relatively to the telescope—and passing through the focus of the telescope transversely to the optical axis, and a director rigidly connected to the scale and subject to an invariable terrestrial force, the focal length of the telescopic objective being equal to the radius of the scale.

811,778. **INSULATING MATERIAL.** CHARLES C. HALL, Alexandria, Ind. Filed May 11, 1905. Serial No. 259,994.

Claim.—An insulating material consisting of a commixture of asbestos and ground wood-pulp in the proportion of ninety-two per cent. of asbestos and eight per cent. of wood-pulp, and an oleaginous substance with which the compound is permeated throughout.

811,779. **RAIL-JOINT.** PERCY H. HARPER, Wellston, Ohio. Filed Sept. 19, 1905. Serial No. 279,091.

Claim.—1. In a rail-joint, the combination of rail ends, one of which has engaging devices on the respective portions of its base-flange and the other having the respective portions of its base-flange extended beyond the rail end and separated by a slot and adapted to overlap the respective portions of the base-flange of the other rail end and engage the engaging devices thereon, the aforesaid slot being adapted to receive the web of the opposite rail end.

2. In a rail-joint, the combination of rail ends, one of which has raised parts on the respective portions of its base-flange and the other having the respective portions of its base-flange offset upwardly and extended beyond the rail end and provided with hook-shaped ends, said extended portions being separated by a slot which is adapted to receive the web of the opposite rail end and said hook-shaped ends being adapted to hook over and engage the raised parts on the respective portions of the base-flange of the other rail end.

3. In a rail-joint, the combination of rail ends, one of which has raised parts transverse to its base-flanges, a web portion projecting beyond the ends of said flanges, oppositely-beveled members on the end of its web above said projecting portion, and an upright projection on the end of its head; the other rail end having its base-flanges extended beyond its web, transversely grooved on the under side and separated by a central slot, oppositely-beveled members on the end of the web, and an upright notch in the end of its head.

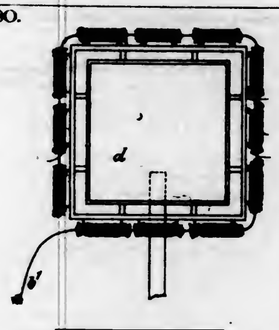
4. In a rail-joint, the combination of rail ends, each having oppositely-beveled members on the end of its web which are disposed one above the other, those on one rail end being adapted to engage those on the other rail end.

811,780. **FLASH-LIGHT CARTRIDGE.** GUSTAV H. HERRMANN, Schwedenitz, Germany. Filed Nov. 25, 1903. Serial No. 183,670.

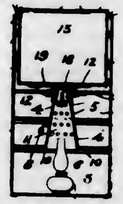
Claim.—1. A flash-light cartridge comprising a seamless, porous tube of animal-hair fabric containing flash-powder, substantially as and for the purposes set forth.

2. A flash-light cartridge comprising a seamless, porous tube of animal-hair fabric, composition flash-powder contained therein, a fuse in contact with said charge and protruding from said seamless tube, and means for closing the ends of said tube, substantially as and for the purposes set forth.

811,780.



811,781. **DOUGH-RAISER.** WILLIAM H. HOLLANDER, Evansville, Ind. Filed Dec. 28, 1904. Serial No. 238,570.

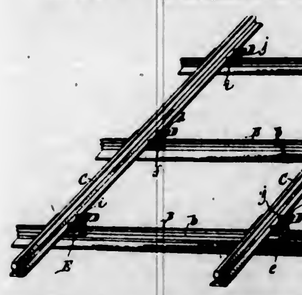


Claim.—1. In a device of the class described, the combination with a casing and means for heating the interior of said casing, of a dough-box within said casing and separated therefrom, said dough-box being raised above the casing, means connecting the casing to said dough-box at the top, said means provided with outlet-apertures for the heat, and a lid for said dough-box.

2. In a device of the class described, the combination with a casing and means for heating the interior of said casing, of a dough-box within said casing and separated therefrom, said dough-box being raised above the casing, beveled strips separating the casing and the dough-box and connecting them together at the top of said casing and dough-box, said beveled strips provided with heat-outlet apertures, and a top adapted to close the dough-box.

3. In a device of the class described, the combination with a casing, of a combustion-chamber therein, a plurality of compartments therein, one of said compartments being separated from the casing, the other of said compartments being provided with shelves, a flue running through one of said compartments provided with apertures adapted to direct air into the compartment through which it runs, a damper in said flue adapted to change the current of heated air through said flue, a shield protecting the top of the compartment through which the flue runs, and a shield protecting the bottom of the separated compartment.

811,782. **METALLIC RAILWAY-TIE.** PRESTON T. LARGE, North Tonawanda, N. Y. Filed Sept. 14, 1905. Serial No. 278,422.



Claim.—1. A metallic tie having a horizontal base and a vertical web which is corrugated horizontally, substantially as set forth.

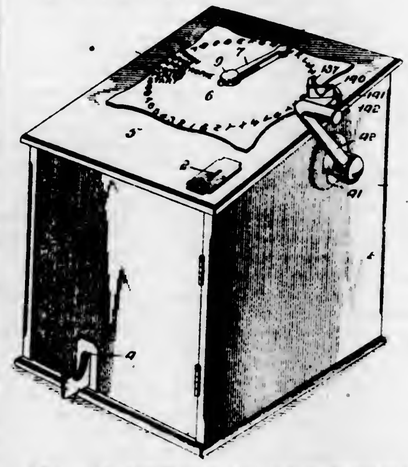
2. A metallic tie having a horizontal base and a horizontally-corrugated web which projects upwardly from the central part of the base, substantially as set forth.

3. A metallic tie having a vertical web which is corrugated horizontally and a rail-holder having a vertical web which is corrugated horizontally and secured to the web of said tie, substantially as set forth.

4. A metallic tie having a horizontal base and a horizontally-corrugated web projecting upwardly from the central part of said base, and a rail-holder having a horizontal top plate and a web projecting downwardly from said top, and having horizontal corrugations which fit into the corrugations of the web on said base, substantially as set forth.

5. A metallic tie having a horizontal base and a horizontally-corrugated web projecting upwardly from the central part of said base, a rail-holder having a horizontal top plate and a web projecting downwardly from said top and having horizontal corrugations which fit into the corrugations of the web on said base, and bolts connecting the webs of the tie and the rail-holder, substantially as set forth.

811,783. **STAMPING-PRESS.** HENRY C. LAVERY, West Superior, Wis., assignor to Mills Novelty Company, Chicago, Ill. Filed Dec. 12, 1903. Serial No. 134,933.



Claim.—1. In a stamping-press, blank-handling mechanism having a rotatable anvil-support and also comprising means for positioning, temporarily holding, releasing, and delivering a blank, spacing mechanism coöperating with said support to effect a step-by-step movement thereof, a rotatable die-holder having a plurality of plunger die elements, means for selecting the individual die elements for the printing position, and an operating mechanism having means for actuating the spacing mechanism and also for actuating the selected plunger die element.

2. In a stamping-press, blank-handling mechanism having an anvil-support for the blank and comprising means for positioning, temporarily holding, releasing, and delivering a blank, a die-holder in the form of a rotary type-wheel bearing a plurality of spring-retracted plunger die elements and provided with an upstanding circular centering-rack, and operating mechanism including an actuator for the selected die elements, and a combined setting and registering dog coöperating with the rack of the wheel.

3. In a machine of the class described, blank-handling mechanism having an anvil-support for the blank and also comprising means for positioning, temporarily holding, releasing, and delivering a blank, a die-holder in the form of a rotary type-wheel bearing a plurality of spring-retracted plunger die elements and having a centering-rack, spacing mechanism for effecting character spacing, an operating mechanism including an actuator for the selected die element, and a combined setting and registering dog having members coöperating respectively with the rack of the type-wheel and also with the spacing mechanism for actuating the latter.

4. In a machine of the class described, blank-handling mechanism having a rotatable anvil-support for the blank and also comprising means for positioning, temporarily holding, releasing, and de-

livering a blank, spacing mechanism coöperating with the anvil-support to effect a step-by-step movement thereof, a die-holder in the form of a rotary type-wheel overlapping the anvil-support and provided with a plurality of movable die elements and a centering-rack, means for selecting the individual die elements, and operating mechanism including a reciprocatory plunger-actuator for the selected die element, and a reciprocatory combined setting and registering dog having separate members coöperating respectively with the said rack and the spacing mechanism for the anvil-support.

5. In a machine of the class described, blank-handling mechanism having a rotatable anvil-support for the blank, spacing mechanism for the support including a pawl-carrier and an advancing member, a die-holder in the form of a rotary type-wheel bearing a plurality of die elements and having a centering-rack, and an operating mechanism including a main working shaft, a reciprocatory die-actuating plunger operated from the shaft, and a reciprocatory dog also operated from said shaft and having separate members coöperating respectively with the rack of the type-wheel and the advancing member of the pawl-carrier.

6. In a machine of the class described, a blank-handling mechanism having an anvil-support in the form of a ratchet-wheel, spacing mechanism including a swinging pawl-carrier having a pawl coöperating with the ratchet-wheel and also having an advancing member, a die-holder in the form of a rotary type-wheel, and operating mechanism including a main working shaft, a reciprocatory die-actuating plunger operated from said shaft, and a reciprocatory combined setting and registering plunger coöperating with the type-wheel and also with the advancing member of the pawl-carrier.

7. In a machine of the class described, blank-handling mechanism having an anvil-support in the form of a ratchet-wheel, character-spacing mechanism essentially comprising a swinging pawl-carrying frame bearing a pawl coöperating with the ratchet-wheel and an operating-lever yieldingly connected with the frame, said operating-lever being provided with an advancing member, a rotary type-wheel bearing die elements, and operating mechanism including a main working shaft, a reciprocatory die-actuator plunger, and a reciprocatory combined setting and registering dog having separate members coöperating respectively with the type-wheel and with the advancing member for the pawl-carrier of the spacing mechanism.

8. In a machine of the class described, blank-handling mechanism having a rotatable support in the form of a ratchet-wheel, character-spacing mechanism comprising a pivotally-supported swinging pawl-carrying frame having a member provided with a pendent arresting projection, and an operating-lever pivotally supported on the frame and having a yielding connection therewith, said operating-lever for the pawl-carrying frame also being provided with an arm extension consititutting an advancing member, a rotary die-holder in the form of a wheel bearing thereon stops of varying projection with which coöperates the arresting projection of the pawl-carrying frame, and operating mechanism including a die-actuator for the selected die, and a dog having a member operating against the advancing member for the pawl-carrying frame of the spacing mechanism.

9. In a machine of the class described, blank-handling mechanism having a step-by-step rotated anvil-support and also comprising means for positioning, temporarily holding, releasing, and delivering a blank, a rotary die-holder including a type-wheel bearing the individual die elements, and a die-adjusting shaft provided at one end with a selecting member or actuator, and operating mechanism having means, operated from a common shaft, for actuating the selected die element and also for effecting character-spacing through the movement of the anvil-support.

10. In a machine of the class described, printing mechanism having individual die elements, the blank-handling mechanism having a rotatable anvil-support, and an auxiliary blank-setting device comprising means for varying the position of the anvil-support.

11. In a machine of the class described, printing mechanism having individual die elements, blank-handling mechanism having a rotatable anvil-support for the blank, and an auxiliary blank-setting device having a geared connection with the anvil-support to provide for varying the position thereof.

12. In a machine of the class described, printing mechanism having individual die elements, blank-handling mechanism having a rotatable anvil-support, and an auxiliary blank-setting device including an adjusting-shaft bearing an indicator and having a geared connection with the anvil-support.

13. In a machine of the class described, printing mechanism having individual die elements, blank-handling mechanism having a rotatable anvil-support for the blank, and an auxiliary blank-setting device including an adjusting-shaft, and a ratchet-gear connection between said shaft and the anvil-support.

14. In a machine of the class described, printing mechanism having individual die elements, blank-handling mechanism having a rotatable anvil-support for the blank, and an auxiliary blank-setting device including an adjusting-shaft bearing an indicator and ratchet interlocked wheels having a geared connection with the anvil-support.

15. In a machine of the class described, printing mechanism having individual die elements, blank-handling mechanism having a rotatable anvil-support for the blank, and an auxiliary blank-setting device including an adjusting-shaft bearing upon its exterior end an indicator, a ratchet adjusting-wheel made fast to said shaft, a setting-gear loose upon the said shaft and bearing a pawl coöperating with said ratchet adjusting-wheel, and a gear-wheel fast with the anvil-support and meshing with the said setting-gear.

16. In a machine of the class described, printing mechanism having individual die elements, blank-handling mechanism having a rotatable anvil-support for the blank, and an auxiliary blank-setting device comprising a spring-returned adjusting-shaft bearing an indicator and having a ratchet-gear connection with the anvil-support, a ratchet-locking device for holding the shaft in its adjusted position, and mechanism for releasing the ratchet-locking device by the finishing operation of the machine.

17. In a machine of the class described, printing mechanism having individual die elements, blank-handling mechanism having a rotatable anvil-support for the blank, a blank-holding device including a lifting member, and an auxiliary blank-setting device comprising an adjusting-shaft having a ratchet-gear connection with the anvil-support and bearing a ratchet-locking disk, and a pivotally-supported pawl-frame bearing a catch-pawl coöperating with said locking-disk and having an element moved against by the lifting member of said holding device at the finishing operation.

18. In a machine of the class described, printing mechanism having individual die elements, blank-handling mechanism including an anvil-support for the blank and comprising means for positioning and delivering the blank, a holding device for clamping and releasing the automatically-positioned blank upon the anvil, and controlling mechanism comprising means for setting and releasing the holding device respectively after the positioning of a blank and at the completion of the stamping operation.

19. In a machine of the class described, printing mechanism having individual die elements, blank-handling mechanism including an anvil for the blank and comprising means for positioning and delivering the blank, a holding device for clamping and releasing the automatically-positioned blank upon the anvil-support, controlling mechanism for the holding device, and operating mechanism coöperating with said controlling mechanism to provide for setting and releasing the holding device respectively after the positioning of a blank and at the completion of the stamping operation.

20. In a machine of the class described, printing mechanism having individual die elements, blank-handling mechanism having a rotatable anvil, a holding device including a movable clamping-spindle carrying a presser-foot for clamping upon the blank, said clamping-spindle being rotatable with the anvil, and mechanism comprising means for moving the clamping-spindle in directions for setting and releasing purposes.

21. In a machine of the class described, printing mechanism having individual die elements, blank-handling mechanism having a rotatable anvil, a holding device having a reciprocatory and rotatable clamping-spindle bearing a presser-foot, operating mechanism, a clutch arranged to provide an operative connection between the operating mechanism and the holding device, and means for controlling the adjustment of said clutch.

22. In a machine of the class described, printing mechanism having individual die elements, blank-handling mechanism having an anvil for the blank, a holding device including a spindle bearing a presser-foot, an operating device, a clutch arranged to provide an operative connection between the operating device and the spindle of the holding device, and means for controlling the adjustment of said clutch through the action of the operating device.

23. In a machine of the class described, printing mechanism, blank-handling mechanism having a rotatable anvil-support, a holding device essentially comprising a reciprocatory and rotatable clamping-spindle bearing a presser-foot, and a spring-pressed clamp-carrying bracket interlocked with the clamping-spindle, an operating device, a clutch arranged to provide an operative connection between the said operating device and the clamp-carrying bracket, and a clutch-shifter coöperating with said clutch and controlled through the movement of the operating device.

24. In a machine of the class described, printing mechanism, blank-handling mechanism including an anvil for the blank and a feed-lever element, a holding device for the blank including a reciprocatory and rotatable clamping-spindle bearing a presser-foot, and a spring-pressed clamp-carrying bracket interlocked with the spindle, an operating device, a clutch arranged to provide an operative connection between the operating device and the said bracket, a clutch-shifter coacting with the clutch for adjusting the position thereof, and also having an operative connection with said feed-lever element, and a motion-transmitting element operable from the operating device and having a self-releasable clutch connection with the feed-lever element, said motion-transmitting element also acting as a holder for said clutch-shifter.

25. In a machine of the class described, printing mechanism, blank-handling mechanism including a rotatable anvil for the blank, and a feed-lever element having a supplemental holding-stud, a holding device for the blank including a movable clamping-spindle having a spring-pressed bracket member, an operating device having a lifting-cam, a clutch member consisting of a pivotally-mounted spring-adjusted lever carrying a clutch rod or finger adapted to provide an operative connection between said lifting-cam and the bracket member of the spindle, a clutch-shifter consisting of a pivotally-supported oscillating lever provided with a release-arm bearing an adjusting-pin or projection coöperating with the clutch member, said oscillating lever being further provided at an intermediate point with an offstanding latch-arm and at one end with a curved guide-section arranged for engagement by the supplemental holding-pin of the feed-lever element, an operating-spring connected with the said oscillatory lever and tending to normally move the same in a direction for adjusting the clutch member out of action, arresting means for checking the clutch-shifter against movement at the finishing operation, and a motion-transmitting element operable from the operating device and having a releasable clutch connection with the feed-lever element, said motion-transmitting element having a holding stud or pin coöperating with the latch-arm of the clutch-shifter lever.

26. In a machine of the class described, printing mechanism, a blank-support, a magazine for the blanks, blank-feeding mechanism comprising means for transferring a blank onto the support, operating mechanism for stamping and spacing purposes, and a self-releasable clutch connection between the blank-feeding mechanism and the said operating mechanism.

27. In a machine of the class described, printing mechanism, a support for the blank, blank-feeding mechanism comprising means for positioning a blank onto the support and including a lever element, operating mechanism for stamping and spacing purposes, and a motion-transmitting element operable from said operating mechanism and having a self-releasable clutch connection with said feed-lever element.

28. In a machine of the class described, printing mechanism, a support for the blank, blank-feeding mechanism comprising means for positioning a blank onto the support and including a feed-lever element, operating mechanism for stamping and spacing purposes, and a motion-transmitting element operable from the operating mechanism and having a temporary clutch connection with the feed-lever element, said clutch connection being self-releasable during the initial movement in unison between the said two elements.

29. In a machine of the class described, printing mechanism, a support for the blank, a guideway, a working magazine arranged over and in communication with the guideway, blank-feeding mechanism including a transferrer-slide working in the guideway and through the working magazine, and operating mechanism for stamping and spacing purposes, said operating mechanism including a motion-transmitting element having a self-releasable clutch connection with the blank-feeding mechanism.

30. In a machine of the class described, printing mechanism, a support for the blank, a yielding abutment arranged over the support, a swinging self-acting spring-actuated ejector arranged to sweep over the support, and blank-feeding mechanism including a transferrer arranged to move the blank onto the support against the ejector and said abutment.

31. In a stamping-press, the combination with the printing mechanism and the blank-handling mechanism including a transferrer, of a working magazine for holding the blanks acted upon by the transferrer, a separate storage-magazine having a plurality of supply-chambers individually registrable with the working magazine, and means for moving a filled supply-chamber into registration with the working magazine after the chamber in use has been emptied of its blanks.

32. In a stamping-press, the combination with the printing mechanism and the blank-handling mechanism having transferring means, of a working magazine for the blanks acted upon by the transferring means, a storage-magazine having a plurality of supply-chambers individually registrable with the working magazine, means for holding a supply-chamber in registration with the working magazine until the former is emptied, and means for adjusting the storage-magazine to bring a filled supply-chamber into registration with the working magazine.

33. In a stamping-press, the combination with the printing and blank-handling mechanisms, of a working magazine, a storage-magazine having a plurality of supply-chambers individually registrable with the working magazine, means for holding a supply-chamber in registration with the working magazine until the former is emptied, and means for automatically adjusting the storage-magazine to bring a filled supply-chamber into registration with the working magazine.

34. In a stamping-press, the combination with the printing and blank-handling mechanisms, of a working magazine, a storage-magazine having a plurality of supply-chambers individually registrable with the working magazine, means for holding a supply-chamber in registration with the working magazine until the former is emptied, and means for automatically adjusting the storage-magazine to bring a filled supply-chamber into registration with the working magazine through the action of the blank-feeding mechanism.

35. In a machine of the class described, the combination with the printing and blank-handling mechanisms, of a working magazine, a rotatable turret storage-magazine having a plurality of supply-tubes individually registrable with the working magazine and each having a follower provided with a tappet projection, and a magazine-actuator operable from the blank-handling mechanism and adapted to engage against the individual tappet projections when the latter pass into the path of the actuator.

36. In a machine of the class described, the combination with the printing and blank-handling mechanisms, of a working magazine, a rotatable turret storage-magazine having a plurality of upright supply-tubes individually registrable with the working magazine and each having a guiding-rod for the blanks, a floating follower working in each supply-tube and having a tappet-lug projecting exterior thereto, and a spring-retracted swinging magazine-actuator operated from the blank-handling mechanism and having a strike member adapted to engage the individual tappet-lugs when the latter pass into the path of movement of the actuator.

37. In a machine of the class described, the combination with the printing and blank-handling mechanisms, of a working magazine, a rotatable turret storage-magazine having a plurality of upright supply-tubes individually registrable with the working magazine and each having a guiding-rod for the blanks, a floating follower working in each supply-tube and having a tappet-lug projecting exterior thereto, a spring-retracted swinging magazine-actuator operated from the blank-handling mechanism and having a strike member adapted to engage the individual tappet-lugs when the latter pass into the path of movement of the actuator, and a rigid guiding-bar arranged to constitute a check and guide engaged by the tappet-lug of the filled supply-tube brought into register with the working magazine.

38. In a machine of the class described, the combination with the printing and blank-handling mechanisms, of a working magazine, and a storage-magazine having a plurality of supply-tubes each open at its lower end and an automatically-adjusted cover-plate arranged to cover and uncover the open end of each supply-tube.

39. In a machine of the class described, the combination with the printing and blank-handling mechanisms, of a working magazine, and a rotatable storage-magazine having a plurality of supply-tubes open at their lower ends and individually registrable with the working magazine, and a spring-held cover-plate arranged to cover and uncover the open end of each supply-tube and having a pivotal support at one end, each cover-plate when in a closed position being adapted to be displaced to an uncovering inactive position by contact with the working magazine.

40. In a machine of the class described, printing mechanism, blank-handling mechanism, means for effecting a stamping of the characters in a circle upon the blank, a holding device for the blank, an operating device having a self-releasable clutch connection with the blank-handling mechanism, and means for automatically throwing the holding device in and out of action.

41. In a stamping-press, printing mechanism, blank-handling mechanism, and an auxiliary blank-setting device comprising means for setting the blank to variable positions in its printing position.

42. In a stamping-press, printing mechanism, blank-handling mechanism comprising means for positioning the blank, and an auxiliary blank-setting device comprising means for varying the printing position of the blank.

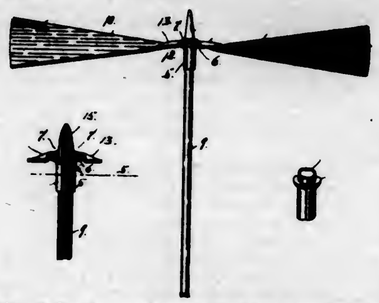
tubular body, a header, substantially horizontal, communicating with said tubular body, and a cluster of water-tubes *g* connecting the

pins in said holes, and rubber stripe intermediate the rows of recesses and arranged in such a manner that a row of recesses on the one plate

the stem against accidental withdrawal and means for preventing independent rotation of the point and body portion

iliary blank-setting device comprising means for varying the printing position of the blank.

811,784. FLYING TOY. LYNN B. MATHEWS, Pittsburg, Pa. Filed Feb. 16, 1905. Serial No. 245,969.

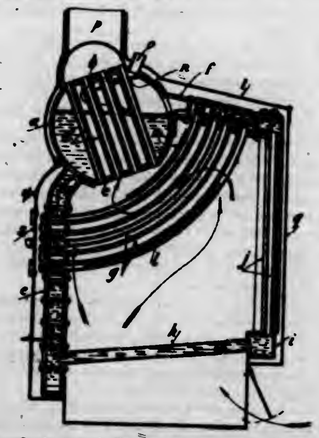


Claim.—1. In a device of the class described, the combination of a ferrule provided with a collar near one extremity, the ferrule having an interiorly-projecting tongue, a winged part having a central apertured portion adapted to receive the shorter part of the ferrule and engage the said collar, the shorter part of the ferrule being bent down on the central part of the winged portion to hold the latter in place, and a stem having a pointed extremity, the stem being inserted in the ferrule and its pointed extremity projecting beyond the winged portion sufficiently to allow the device to spin upon a surface, substantially as described.

2. In a toy of the class described, the combination of a winged part having a central portion provided with strengthening-webs extending outwardly from the opening, a ferrule having a collar engaged by the central part of the winged portion, the ferrule being upset or bent downwardly on the winged portion to hold the latter in place, the central part of the winged portion being also bent downwardly upon the collar, and an operating-stem inserted in the ferrule for the purpose set forth.

3. In a device of the class described, the combination of a ferrule provided with a collar near one extremity, the ferrule having an interiorly-projecting tongue, a winged part having a central apertured portion adapted to receive the shorter part of the ferrule and engage the said collar, the shorter part of the ferrule being bent down on the central part of the winged portion to hold the latter in place, and a stem connected with the ferrule for the purpose set forth.

811,785. STEAM-BOILER. PAUL MEURISSE, Lille, France. Filed July 18, 1905. Serial No. 270,215.



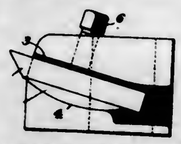
Claim.—1. A steam-boiler comprising an upper transverse tubular body *a* situated in the path of the products of combustion in combination with a vertical header *c* communicating with the said tubular body, a header, substantially horizontal, communicating with said tubular body, and a cluster of water-tubes *g* connecting the two headers, and substantially concentric with the tubular body *a*, substantially as described and for the purpose specified.

2. A steam-boiler comprising an upper transverse tubular body *a* situated in the path of the products of combustion and having two opposite flat portions *b*, *c*, forming tube-plates slightly inclined to the horizontal, in which are expanded fire-tubes *d*, in combination with a vertical header *c* communicating with the said tubular body, a substantially horizontal header *f* discharging into said tubular body, and a nest of water-tubes *g* connecting the two headers substantially concentric with the tubular body *a*, substantially as described and for the purpose specified

3. A steam-boiler comprising an upper transverse tubular body *a* having two flat portions *b*, *c*, forming tube-plates slightly inclined to the horizontal, in which are expanded fire-tubes *d*, in combination with a vertical header *c* communicating with said tubular body; a header, substantially horizontal, communicating with said tubular body; a nest of water-tubes *g* connecting the two headers, and substantially concentric with the tubular body; water-circulating tubes *h* connected at one end to the verical layer of water; a transverse collector *i*, into which the other ends of the tubes *h* discharge; said tubes *h* being situated in proximity to the grate; and a group of vertical tubes *j* forming a water-wall, and connecting the transverse collector *i* with the horizontal header, substantially as described and for the purpose specified.

4. A steam-boiler, comprising an upper transverse tubular body *a*, having two flat portions, *b* and *c*, forming tube-plates, slightly inclined to the horizontal, into which are expanded fire-tubes *d* in combination with a vertical header *c* communicating wth the said tubular body; a header *f*, substantially horizontal, communicating with the said tubular body; a nest of water-tubes *g* traversing the two headers, and having their ends at the side of the vertical header slightly narrowed and perforated on the bottom side, while the ends at the side of the other header are perforated throughout their circumference; tubes *h*, for the circulation of water, discharging at one end into the vertical header; a transverse collector *i*, into which the other ends of the water-tubes *h* discharge; and a group of vertical tubes *j* forming a water-wall, and connecting the transverse collector *i* with the horizontal header *f*, substantially as described and for the purpose specified.

811,786. TOOL-HOLDER. FRANKLIN P. MILLER, Bloomfield, N. J. Filed Mar. 15, 1904. Serial No. 198,947.



Claim.—1. A tool-holder consisting of a block recessed to receive a post to secure it to the bed or carrier of a lathe, tapered in a plane transverse to the axis of the post, and provided with a side recess and means to secure a tool in an inclined position therein, substantially as set forth.

2. A tool-holder consisting of a block recessed to receive a post tapered at each end in a plane transverse to the axis of the post, forming converging side faces, with an inclined recess in each face, and means for securing a tool therein, substantially as set forth.

811,787. APPARATUS FOR PRINTING BOOKS IN TYPE FOR THE BLIND. ROBERT MOSHER, Bucharest, Roumania. Filed May 9, 1905. Serial No. 259,543.

Claim.—1. A printing apparatus provided with a pair of plates each composed of alternate rows of recessed strips and pads, the pads of one plate being opposite the recessed strips of the other plate, and pins removably secured to the recessed strips, substantially as specified.

2. A printing apparatus provided with a pair of hinged plates having rows of rectangular recesses, and intermediate rubber strips arranged in such a manner that a row of recesses on the one plate is opposite a rubber strip on the other plate, the said recesses having conical holes formed in their bottom surfaces, and conical pins in said holes, substantially as specified.

3. A printing apparatus provided with a pair of hinged plates having rows of rectangular recesses, holes communicating therewith,

pins in said holes, and rubber strips intermediate the rows of recesses and arranged in such a manner that a row of recesses on the one plate is opposite a rubber strip on the other plate, the rubber strips being secured between the rows of recesses in dovetailed grooves, substantially as specified.

4. A printing apparatus provided with a recessed plate, pins removably secured thereto, and a reversible cover adapted to engage the pins, substantially as specified.

5. A printing apparatus provided with a pair of hinged plates having recesses, communicating conical perforations, pins removably secured within the perforations, and pads intermediate the recesses, substantially as specified.

6. A printing apparatus provided with a pair of hinged plates having recesses, communicating perforations, dovetail grooves between the recesses, pins removably secured within the perforations, and pads engaging the dovetail grooves, substantially as specified.

7. A printing apparatus provided with a plate having recesses, communicating perforations, pins removably secured within the perforations and projecting beyond the plate, and means coöperating with the pins, whereby the pins are caused to form impressions, substantially as specified.

8. A printing apparatus provided with a plate having recesses, communicating perforations, pins removably secured within the perforations, a cover adapted to engage the pins, and means coöperating with the pins, whereby the pins are caused to form impressions, substantially as specified.

9. A printing apparatus provided with a plate having recesses, communicating perforations, pins removably secured within the perforations and projecting beyond the plate, a reversible cover, means for removably hinging the cover to the plate, and means coöperating with the pins, whereby the pins are caused to form impressions, substantially as specified.

10. A printing apparatus composed of a plate having recesses, communicating perforations, connected pins removably secured within the perforations, and means coöperating with the pins, whereby the pins are caused to form impressions, substantially as specified.

811,788. SPLICING-PIN. JOHN L. MCPARDEN, HENRY L. WILKIE, and WILLIAM H. LEWIS, Detour, Mich. Filed June 20, 1905. Serial No. 266,171.

Claim.—1. A splicing-pin comprising a body portion having a longitudinally-extending recess in one end, a detachable point, a stem upon the point adapted to be seated within the recess and means for preventing independent rotation of the point and stem.

2. A splicing-pin comprising a body portion having a longitudinally-extending recess in one end, a detachable point, a stem upon the point adapted to be seated within the recess, means for holding the stem against accidental withdrawal and means for preventing independent rotation of the point and body portion.

3. A splicing-pin comprising a body portion having a smooth bore in one end, a detachable point slidably mounted within the bore, and means for detachably securing the said point within the bore.

4. A splicing-pin comprising a recessed body portion; a detachable point extending therefrom, and means for preventing independent rotation of the point and stem in any direction.

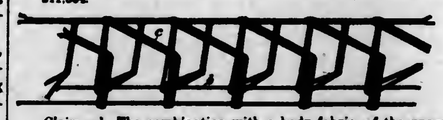
811,789. SEAM FOR SEWED ARTICLES. LAWRENCE ORMEBODE, New York, N. Y., assignor to Union Special Sewing Machine Company, Chicago, Ill., a Corporation of Illinois. Filed June 3, 1904. Serial No. 211,061.

Claim.—1. A seam for sewed articles, comprising a body fabric, threads having loops passed alternately therethrough at points substantially one behind the other, a locking-thread passing through each pair of said loops, and lying over the edge, and surrounding one or the other of said threads on the upper surface of said fabric; substantially as described.

2. A seam for sewed articles, comprising a body fabric, threads having loops passed alternately therethrough at points substantially one behind the other, but lying on the under surface of the fabric, diagonal to each other and with their points together, a third thread passing through both loops at their point of meeting, and lying over the edge, and surrounding one or the other of the threads upon the upper surface of the fabric; substantially as described.

3. A seam for sewed articles, comprising a body fabric, threads having loops passed alternately therethrough at points substantially one behind the other, a locking-thread passing through each of said loops and lying over the edge and passing under one row of loops on the upper surface of the fabric, and surrounding one of said threads on the upper surface of the fabric; substantially as described.

811,790. SEAM FOR SEWED ARTICLES. LAWRENCE ORMEBODE, New York, N. Y., assignor to Union Special Sewing Machine Company, Chicago, Ill., a Corporation of Illinois. Filed June 3, 1904. Serial No. 211,064.



Claim.—1. The combination with a body fabric, of the upper threads, each having loops passed down through the fabric, a third thread engaging each pair of said loops, and lying upon the under face of the fabric and a fourth thread engaging the loops of said third thread and lying upon the upper surface of the fabric and concatenated with the upper threads, upon the upper surface of the fabric, substantially as described.

2. The combination with a body fabric, of the upper threads, having loops passed down therethrough, a third thread, passing through two consecutive loops of the respective threads on the under surface of the fabric and lying upon the under surface of the fabric and a fourth thread passing through the loops of said third thread and extending upon the upper surface of the fabric and surrounding the loops of one thread and being covered by the threads between the loops of the other thread, substantially as described.

3. The combination with a body fabric, of the upper threads having loops passed down therethrough, a third thread, passing through two consecutive loops of the respective threads on the under surface of the fabric and lying upon the under surface of the fabric and a fourth thread passing through the loops of said third thread and extending upon the upper surface of the fabric and surrounding the loops of one thread and being covered by the threads between the loops of the other thread, said fourth thread between the points of its passage through the loops, of the third thread lying along the edge of the fabric, substantially as described.

811,791. MEANS FOR OPERATING DRILLS. OLIN S. PROCTOR, Denver, Colo. Filed Apr. 29, 1905. Serial No. 258,101.

Claim.—1. A rock-drill of the class described, including a cyl-

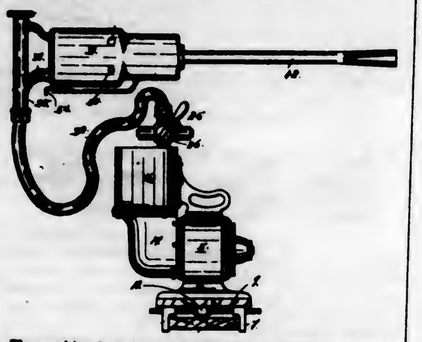
inder, a piston, and means for introducing motive fluid to the cylinder, of a by-pass leading from the drill-cylinder to a point forward of

when the tenons are forced into the grooves portions of the tenons are

one edge of one tenon on each lamina being undercut, the angle be-

5. The combination with three parallel helical wire springs two

inder, a piston, and means for introducing motive fluid to the cylinder, of a by-pass leading from the drill-cylinder to a point forward of the piston for delivering fluid to the drill-hole, and a check-valve located in said by-pass and adapted to allow fluid to pass therethrough to the drill-hole but arranged to prevent the return of the rock cuttings into the cylinder.



2. The combination of a motor cylinder and piston, a drill-cylinder and piston, a conduit connecting the two cylinders, a by-pass leading from the drill-cylinder to a point forward of the piston for delivering fluid to the drill-hole, and means for controlling the passage of air from the motor-cylinder whereby the air is forced into the drill-cylinder during the forward movement of the motor-piston, but rarefaction of the air in the drill-cylinder prevented during the backward movement of the motor-piston, whereby the only outlet for the air from the drill-cylinder is by way of the said by-pass, substantially as described.

3. The combination of a motor-cylinder, a piston therein, a drill-cylinder piston constituting a hammer, a drilling-tool located forward of the hammer and having a longitudinal passage therethrough for delivering fluid to the drill-hole, a conduit between the two cylinders, a by-pass leading from the drill-cylinder to a point in front of the drilling-tool, a valve for controlling the said by-pass, valve mechanism for controlling the passage of air between the two cylinders, said mechanism being constructed to allow the air to pass freely from the motor-cylinder to the drill-cylinder during the forward movement of the motor-piston while the rarefaction of the air in the drill-cylinder is prevented during the return movement of the motor-piston, the motor-cylinder being supplied with air from the atmosphere during the reverse movement of its piston, and adjustable means connected with the drill-cylinder whereby the air may be allowed to escape from the conduit into the atmosphere, or compelled to pass to the drill-cylinder as desired.

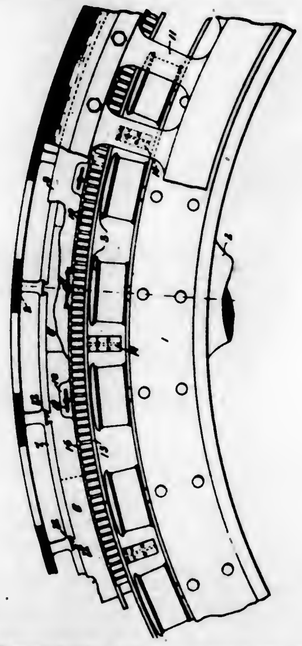
811,792. **DYNAMO-ELECTRIC MACHINE.** HENRY G. REIST, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed May 7, 1904. Serial No. 207,867.

Claim.—1. In a dynamo-electric machine, an annular core, conductors projecting from said core, a casing surrounding said core, brackets formed on said casing, a ring supported by said brackets against which the projecting conductors rest, and a ring concentric with and surrounding the first-mentioned ring and engaging the outer edges of said conductors.

2. In a dynamo-electric machine, an annular core, conductors projecting from said core, a casing surrounding said core, brackets formed on said casing, a ring supported by said brackets against which the projecting conductors rest, a ring concentric with and surrounding the first-mentioned ring engaging the outer edges of said conductors, and means for varying the circumference of said ring.

3. In a dynamo-electric machine, an annular core, conductors projecting from said core, a casing surrounding said core, brackets formed on said casing, a ring supported by said brackets against which the projecting conductors rest, a ring concentric with and surrounding the first-mentioned ring engaging the outer edges of said conductors, and means for rigidly securing said second ring to the core.

4. In combination, a support formed with a plurality of undercut grooves, laminæ each formed with a pair of tenons which enter grooves in said support, said tenons and said grooves being of different shapes, and adjacent layers of laminæ breaking joints whereby when the tenons are forced into the grooves portions of the tenons are bent and a space is left between other portions of the tenons and the walls of the slot into which bent-up portions of the tenons of the laminæ in an adjacent layer are received.



5. In a dynamo-electric machine, a laminated core, dovetail projections on the laminations of said core, and a support formed with retaining-slots adapted to receive said projections, the edges of said projections having a different slope from the sides of said slots.

6. In combination, a support having undercut grooves formed in it, and laminæ secured to said support by tenons entering said grooves, each lamina being formed with two tenons, portions of the side edges of which are separated by a distance less than the distance between the corresponding portions of the walls of the grooves in which they enter.

7. In combination, a support having undercut grooves formed in it, laminæ secured to the support by tenons entering said grooves, each of said laminæ being formed with a plurality of tenons, the tenons and grooves being so proportioned and shaped that when assembled a portion of one at least of the tenons will be distorted.

8. In combination, a support having undercut grooves in it, and laminæ secured thereto by tenons entering said grooves, each of said laminæ being formed with two tenons, portions of the side edges of which are separated by distances different from the distances between corresponding portions of the side walls of the grooves.

9. In combination, a support having an undercut groove formed in it, and a lamina provided with a tenon which enters said groove, one side of said tenon being undercut more than the corresponding wall of said groove, and the parts being so arranged that when the tenon is forced in the groove a portion at the tip of the tenon is turned up.

10. In a dynamo-electric machine, an external armature comprising an outer annular supporting-frame and an inner annular core, armature-conductors carried by the core, the ends of said conductors projecting beyond the core, a radial stiffening member connected to one end of said supporting-frame, and means carried thereby for supporting the projecting ends of the armature-conductors.

11. In combination, a support having grooves cut in it, the sides of which are undercut at an angle of about forty-five degrees with the face of the support, and laminæ secured to said support by tenons entering said groove, one side of each tenon being undercut at an angle of about thirty degrees with the face of the support.

12. In combination, a support having undercut grooves formed in it, laminæ secured to said support by tenons entering said groove, one edge of one tenon on each lamina being undercut, the angle between the undercut edge of the tenon and the body of the lamina being less than the angle between the wall of the slot and the face of the support, and the parts being so proportioned and arranged that a portion of the undercut side of the tenon is turned up by the wall of the slot in assembling the laminæ on the support.

13. In a dynamo-electric machine, a laminated core, dovetail projections on the laminations of said core, and a member slotted to receive said projections and adapted to support said core, the edges of said projections making a more acute angle with the adjacent edges of the laminations than the sides of the slots in said member make with the adjacent surface of said member.

14. In a dynamo-electric machine, a laminated core, a slotted member supporting said core, projecting dovetails on the laminations of said core engaging the slots in said member, said projections having only one edge sloping, and adjacent projections in the same slot being arranged with their sloping edges facing in opposite directions.

15. In a dynamo-electric machine, a laminated core, a slotted member supporting said core, projecting dovetails on the laminations of said core engaging the slots in said member, said projections having only one edge sloping, and a portion of said projections having their sloping edges facing in an opposite direction to the sloping edges of the other projections.

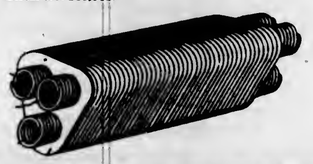
16. In a dynamo-electric machine, a laminated core, a slotted member supporting said core, projecting dovetails on the laminations of said core engaging the slots in said member, said projections having only one edge sloping, and a portion of said projections having their sloping edges facing in an opposite direction to the sloping edges of the other projections, said sloping edges making a more acute angle with the adjacent edges of the laminations than the sides of the slots in said member make with the adjacent surface of said member.

811,793. **METHOD OF MAKING WATERPROOF WELTS.** JOHN R. REYNOLDS, Hartford, Conn., assignor to The Waterproof Welt and Filler Company, Hartford, Conn., a Corporation of Delaware. Filed Sept. 21, 1905. Serial No. 279,466.

Claim.—1. The method of making a waterproof welt which consists in placing a mass of vulcanized waterproof material in a plastic condition in a suitable receptacle, forcing the mass through a die to form a thin flat strip having a plurality of rounds or beads thereon, vulcanizing the strip and finally cutting the strip between the beads to form a plurality of welts.

2. The method of making a waterproof welt which consists in placing a mass of vulcanized waterproof material in a plastic condition in a suitable receptacle, forcing the mass through the die to form a thin flat strip having a bead on each edge, vulcanizing the strip and finally cutting the strip midway between the beads to form two welts.

811,794. **BELT.** JOHN RUSSELL, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed July 9, 1904. Serial No. 215,283.



Claim.—1. A belt consisting of an elastic core and a covering of loose washers.

2. A belt having an elastic core comprising one or more helical springs, and a covering of loose washers.

3. A belt consisting of a plurality of parallel helical springs, and a plurality of loose washers assembled on the same in close contact.

4. A belt consisting of a plurality of parallel helical wire springs having their turns close together, and a plurality of loose leather washers strung on said springs in close contact.

5. The combination with three parallel helical wire springs two in contact and the third equidistant from both, of a plurality of triangular washers each having an S-shaped hole and a circular hole.

6. In a belt, an elastic core member in the form of a helical spring, and a covering of loose washers.

811,795. **WALL-RECEPTACLE.** HOWARD B. SARGENT, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed Nov. 19, 1903. Serial No. 181,864.

Claim.—1. A receptacle comprising a base of insulating material having a central and two end cavities in its upper side, a contact-sleeve and center contact secured in the central cavity, a binding-post secured in each of the end cavities and electrically connected to the said sleeve and center contact respectively, and a face-plate connected to said base and provided with a central opening and a lid therefor.

2. A receptacle comprising a base of insulating material having around central cavity in its upper face and two cavities in its lower face communicating with said central cavity, a flanged contact-sleeve in said central cavity, a yoke-shaped metal connection adapted to engage the flange of the sleeve and having an arm extending through the side of the sleeve and into one of the lower cavities, a center contact extending through an aperture in the opposite side of said sleeve and into the other lower cavity, means for securing said connection and center contact to the base, and means located in the upper face of said base for connecting the said connection and center contact to an electric circuit.

3. A receptacle comprising a base of insulating material having a central cavity and two end cavities in its upper side, holes extending from the bottom of said base into said end cavities for the passage therethrough of the line-wires, binding-posts secured in said end cavities, and two metal contacts located in said central cavity adapted to coöperate with an incandescent lamp and electrically connected to the respective binding-posts.

4. A receptacle comprising an insulating-base having a central and two end cavities in its upper face and two end cavities in its lower face communicating with the inner end of the central cavity, metallic contacts located in said central cavity, binding-posts located in said upper end cavities, and electrical connections between said binding-posts and said metallic contacts.

5. A plug-receptacle formed of a single block of insulating material having a circular central socket and isolated chambers each side of the central socket, a threaded metallic shell lining the walls of the central socket, a metallic contact at the center of the bottom of the socket, a binding-post with a binding-screw in an isolated chamber each side of the central socket, a metallic connection extending through an opening in the wall between the central socket and one chamber and joining one binding-post and the threaded shell, and a metallic connection extending through an opening in the wall between the central socket and another chamber and joining the other binding-post and the central contact.

6. A plug-receptacle formed of a single block of insulating material having a circular central socket and isolated chambers each side of the central socket, a threaded metallic shell lining the walls of the cental socket, a metallic contact at the center of the bottom of the socket, a binding-post with a binding-screw in an isolated chamber each side of the central socket, a metallic connection extending through an opening in the wall between the central socket and one chamber and joining one binding-post and the threaded shell, a metallic connection extending through an opening in the wall between the central socket and another chamber and joining the other binding-post and the central contact, a plate fastened to the front of the receptacle and covering the socket and the chambers, and a lid hinged to the plate.

811,796. **SNAP-SWITCH.** HOWARD B. SARGENT, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed July 8, 1904. Serial No. 215,288.

Claim.—1. In a quick-break switch, the combination with a contact-post, of a clip secured to the top thereof, and consisting of a middle portion having integral overlapping end portions folded over in opposite directions.

2. In a quick-break switch, the combination with a contact-post, of a clip secured to the top thereof, and consisting of a middle

of the shaft also receiving the driver for the pusher-chain of the said loading apparatus while the other part of said shaft carries a pinion

2. In a quick-break switch, the combination with a contact-post, of a clip secured to the top thereof, and consisting of a middle portion having integral overlapping end portions folded over in opposite directions, said end portions having registering holes giving access to the middle portion where it is secured to said post.

3. In a quick-break switch, the combination with a spindle, of a switch-blade rotatably mounted thereon, a spring connecting them, a stationary stop-plate, two catches rotating with the switch-blade and movable radially to the spindle, and two arms on said spindle for simultaneously actuating said catches.

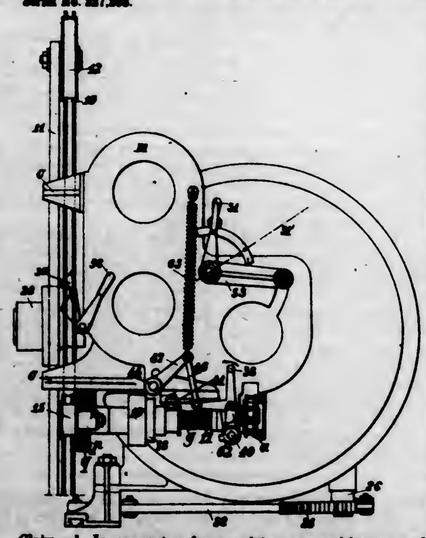
4. In a quick-break switch, the combination with a spindle, of a switch-blade rotatably mounted thereon, a spring connecting them, a stop-plate in which said spindle is journaled, guide-flanges rotatable with the switch-blade, two similar catch-plates located on opposite sides of the spindle and sliding between said flanges, and a double-ended pin transverse to said spindle for simultaneously actuating said catches in opposite directions radially to said spindle.

5. In a quick-break switch, the combination with a spindle, of a switch-blade rotatably mounted thereon, a spring connecting them, a stop-plate in which said spindle is journaled, guide-flanges rotatable with said switch-blade, two catch-plates located on opposite sides of the spindle between said flanges with their adjacent edges in contact, each plate having a recess through which the spindle passes and provided with shoulders 20 21, and a double-ended pin transverse to said spindle and engaging with said shoulders.

6. In a quick-break switch, the combination with a spindle provided with two oppositely-arranged arms, of two plates movable in opposite directions in the plane of said arms, and recesses in the adjacent edges of said plates engaged by said arms.

7. In a quick-break switch, the combination with a spindle, of a stop-plate, and radially-movable catches simultaneously actuated by said spindle and engaging said stop-plate at opposite points.

811,797. **APPARATUS FOR LOADING GUNS IN TURRETS, &c.** CHARLES P. R. SCHNEIDER, Le Creusot, France. Filed Oct. 5, 1904. Serial No. 227,208.



Claim.—1. In apparatus for supplying ammunition to and loading guns mounted in turrets or the like, said apparatus being operated by a common driving mechanism, the combination of a cage furnished with a charging or loading apparatus and a divided shaft the extremities of which carry the two elements of a clutch, one part of the shaft also receiving the driver for the pusher-chain of the said loading apparatus while the other part of said shaft carries a pinion constantly in engagement with the chain of the charge-hoist, and a brake which is normally kept applied but which is automatically released by the contact with the gun or a fixed portion of the turret or mounting.

2. A hoisting-cage provided with a revolver or revolving cylinder having three or more receptacles or chambers for the projectile and the cartridges, this revolver being arranged to turn in the casing and being actuated by transmission-gear comprising a cam, pinion and chain connected to the endless pusher-chain of the continuous charging apparatus.

3. In combination, an ammunition-hoisting cage, a charging-plate, pivoted upon a shaft carrying a lever which is provided with a roller adapted to automatically engage with a cam of the gun or of the waiting tray for the automatic depression of the plate.

4. In combination, an ammunition-hoisting cage, a pivotally-supported charging-plate thereon and a tappet engaging an object in the path of the cage to automatically raise and lower said plate.

5. In an ammunition hoisting and loading device for guns, the combination of a hoisting-cage, a loading device for transferring the ammunition from the cage to the gun, a power device, and a connection operable at will to connect said power device to said cage or said loading device.

6. In ammunition hoisting and loading apparatus, the combination of an ammunition-hoisting cage, loading mechanism carried thereby, a two-section shaft on said cage, means for raising and lowering said cage in engagement with one of said shaft-sections, a brake normally applied to said section during movement of the cage, brake-release means in the path of said cage permitting rotation of said section when said brake is released, a clutch device normally restrained from action for connecting and disconnecting said shaft-sections, and clutch-operating means for throwing in and out of operation said loading mechanism.

7. In an ammunition hoisting and loading device for guns, the combination of a hoisting-cage having a revolving ammunition-carrier therein, a loading device for transferring the ammunition from the carrier to the gun, power mechanism in operative relation with said cage and loading device, and operative connections between said loading device and carrier whereby the latter is rotated by the movements of said loading device.

8. In an ammunition hoisting and loading device, the combination of an ammunition-hoisting cage, power mechanism for raising and lowering the same, a shaft on said cage taking power from said mechanism, loading mechanism on the cage having a clutch connection with said shaft and automatic clutch-operating means for throwing the loading mechanism in and out of connection with said shaft.

9. In an ammunition hoisting and loading device, the combination of an ammunition-hoisting cage, power mechanism for raising and lowering the same, a shaft on said cage for taking power from said mechanism, loading mechanism on the cage having a clutch connection with said shaft, a brake device normally holding said shaft from rotation, and automatic brake-release means for releasing said shaft to permit the same to transmit power to the loading mechanism when said clutch device is closed.

10. In an ammunition hoisting and loading device, the combination of a hoisting-cage, power mechanism for raising and lowering the same, a revolvible shaft on said cage engaging said power mechanism, a brake normally restraining said shaft from rotation and automatic brake-release means for releasing said shaft to stop the upward movement of said cage.

811,798. **PENCIL-SHARPENER.** HENRY H. A. SCHWARZ, Brighton, England. Filed Dec. 27, 1904. Serial No. 238,569.

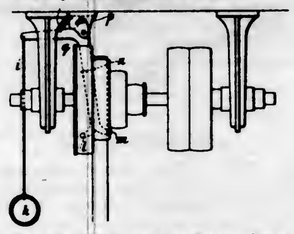
Claim.—1. A sharpening device of the class described embodying a guide provided with a suitable flat guiding-surface, and a cutting-blade having the cutting edge thereof arranged at an acute angle to and longitudinally of said guide and disposed at one side thereof, said guide comprising a flat body extending from the blade at approximately a right angle thereto, the heel of the blade being in contact with the adjacent side of the guide.

2. A sharpening device consisting of a cutting-blade, and a guide for said blade arranged at an acute angle to the cutting edge thereof, the heel of the blade being interlocked with the guide, where-

by these parts are reinforced against lateral movement relative to one another.

3. A sharpening device consisting of a cutting-blade, and a guide for said blade arranged at an acute angle to the cutting edge thereof, the guide comprising a flat body located in a plane approximately at a right angle to the plane including the cutting-blade, the body of the guide being formed with a recess or depression receiving the heel of the blade and affording interlocking connection between these parts.

811,799. **BELT-SHIFTING FOR SPEED-CONES.** OTTO SEIDEMANN, Jena, Germany, assignor to The Firm of Carl Zeiss, Jena, Germany. Filed July 24, 1905. Serial No. 270,979.



Claim.—In a belt-shifting appliance for speed-cones the combination, with the movable carrier of the belt-fork, of a self-acting device, permanently tending to move the carrier in the direction toward the next higher step against the resistance of the belt tightened on its actual step, and of means for moving the carrier in the direction toward the next lower step against the power of the self-acting device.

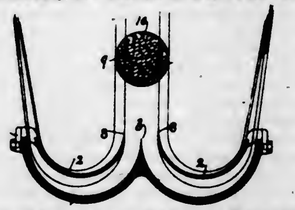
811,800. **ROLLER FOR TYPE-WRITERS.** WILLIAM A. SMALL, San Francisco, Cal., assignor, by direct and mesne assignments, to Noiseless Typewriter Company, a Corporation of California. Filed Aug. 15, 1904. Serial No. 220,880.

Claim.—A roller for type-writers comprising a hollow wooden body having an enlarged head at one end thereof, a wooden sleeve having a threaded engagement with the other end thereof, a soft-rubber tube encircling the wooden body between the head and sleeve, and an external sheath encircling the tube and head and sleeve, substantially as described.

811,801. **OIL-CUP.** NATHAN SMITH, Stevensville, Md. Filed Mar. 10, 1905. Serial No. 249,621.

Claim.—A hand-oiler comprising a contractible, flexible bulb, an integral flange extending from the bottom thereof and adapted to support the same in an upright position, a metallic ring embedded within the flange and having one edge flush with the bottom of the flange, said ring constituting a wear device, and an outlet-tube detachably connected to the top of the bulb, the bottom of said oiler being adapted to be forced inward at points surrounded by the ring.

811,802. **BUCKET FOR IMPULSE WATER-WHEELS.** WILLIAM S. SMITH, Berkeley, Cal. Filed Oct. 27, 1903. Serial No. 178,705.



Claim.—1. In a bucket for impulse water-wheels of the hurdy-gurdy type a divided main portion which is substantially a complete bucket and supplementary curved portions located on opposite sides of the dividing-wedge of the maiu portion and suitably secured to the main portion.

2. In a bucket for impulse water-wheels of the hurdy-gurdy type a divided main portion which is substantially a complete bucket and supplementary curved portions located on opposite sides of the dividing-wedge of the main portion, independently constructed and mechanically secured to the main portion.

3. In a bucket for impulse water-wheels of the hurdy-gurdy type a divided main portion which is substantially a complete bucket and supplementary curved portions symmetrically located on opposite sides of the dividing-wedge of the main portion, symmetrically placed with respect to the curved parts of the main portion and suitably secured to the main portion.

4. In a bucket for impulse water-wheels of the hurdy-gurdy type a divided main portion which is substantially a complete bucket, supplementary curved portions symmetrically located on opposite sides of the dividing-wedge of the main portion, symmetrically placed with respect to the curved parts of the main portion, the inner or working curved surfaces being approximately parallel to the inner or working curved surfaces of the main portion.

5. In a bucket for impulse water-wheels of the hurdy-gurdy type a divided main portion which is substantially a complete bucket, supplementary curved portions symmetrically placed with respect to the curved parts of the main portion, the inner or working faces of the main and supplementary portions being approximately parallel, there being a clear space between the main and supplementary parts through which water flowing over the working surface of the main part can freely pass, the supplementary parts being suitably secured to the main part in such a manner as not to interfere with the free discharge of water from the main part.

6. In a bucket for impulse water-wheels of the hurdy-gurdy type a divided main portion which is substantially a complete bucket, supplementary curved portions suitably secured to the main portion in such a manner as not to interfere with the free flow of water over the surface of the main portion, the side of each supplementary portion which is adjacent to the dividing-wedge of the main portion being substantially parallel to this dividing-wedge, and at a distance

from it which is less than half the diameter of the stream of water entering the bucket, there being clear space between the sides of the supplementary portions and the dividing-wedge of the main portion through which a portion of the stream discharging into the bucket can freely enter the main portion.

7. In a bucket for impulse water-wheels of the hurdy-gurdy type a divided main portion which is substantially a complete bucket, supplementary curved portions suitably secured to the main portion in such a manner that the sides of the supplementary portion adjacent to the dividing-wedge of the main portion are substantially parallel to this dividing-wedge and at a distance from it which is less than half the diameter of the stream of water discharging into the bucket, the metal at the lips of the sides of the supplementary portions which are adjacent to the dividing-wedge of the main portion being reduced in thickness so as to present cutting edges to a stream of water impinging upon them, the curves of the inner or working faces of the supplementary portions at these cutting edges terminating in planes which are substantially parallel to the plane of the water-wheel.

8. A bucket for impulse water-wheels provided with a multiplicity of dividing edges in the path of the entering stream, these dividing edges being substantially parallel to each other and lying in the median plane of the water-wheel or in planes parallel to this median plane and being substantially the lines of tangency of the deflecting-surfaces of the bucket with the median plane of the water-wheel or with planes parallel to this median plane.

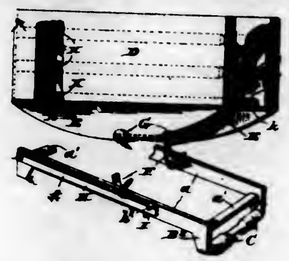
9. A bucket for impulse water-wheels provided with a multiplicity of dividing edges in the path of the entering stream, these dividing edges being substantially parallel to each other and lying in the median plane of the water-wheel or in planes parallel to this median plane and being substantially the lines of tangency of the deflecting-surfaces of the bucket with the median plane of the water-wheel or with planes parallel to this median plane, and independent curved deflecting-surfaces arranged in two groups, these groups being substantially duplicates and symmetrically placed on opposite sides of the median plane of the water-wheel, the members of each group being approximately concentric and having the receiving edges substantially tangent to the median plane of the water-wheel or to planes parallel to this median plane, the discharge edges being at angular distances from the receiving edges approximating to one hundred and eighty degrees.

811,803. SASH-FASTENER. JOHN W. STATON, Brownwood, Tex. Filed June 15, 1905. Serial No. 265,423.

Claim.—The combination with a window-frame and sashes therein; of a rod having screw-threads at one end and extending through and secured to the upper end of the sash, said rod having oppositely-disposed series of notches therein and said rod extending between the sashes, and forked spring locking-plates rigidly secured at one end to the sashes and straddling the rod and adapted to engage the notches in the series farthest removed from the sashes to which said plates are secured, and laterally-extending wings at the free end of each locking-plate, the weight of said sashes being adapted to clamp the rod between the sashes and their locking-plates.

811,804. WASHING-MACHINE. JOHN W. STRAUS, Decatur, Ill. Filed Oct. 6, 1904. Serial No. 227,178.

Claim.—In a washing-machine, a rectangular-shaped receptacle provided with continuous independent transversely-ribbed strips on the interior thereof separated by intervening spaces and arranged longitudinally of the receptacle on its sides and bottom and with the strips situated on the bottom supported by spacing-blocks.



811,805. STEAM-TURBINE. JOHANN STUMPF, Berlin, Germany, assignor to General Electric Company, a Corporation of New York. Filed Dec. 26, 1901. Renewed Sept. 19, 1904. Serial No. 224,960.

Claim.—1. In a steam or gas turbine, the combination of a bucket-wheel and a nozzle-frame, of nozzles fixed in the frame, the said nozzles comprising an inlet part having a round section, a straight expansion part having a rectangular section and a narrow passage situated between these parts, substantially as described and for the purpose set forth.

2. In a steam or gas turbine, the combination of a bucket-wheel and a nozzle-frame, of nozzles fixed in the frame, the said nozzles comprising an inlet part having a round section, a straight expansion part having a rectangular section and a narrow passage situated between these parts, the nozzles being situated so as to leave only a small wedge-shaped part between the expansion part of the same, substantially as described and for the purpose set forth.

3. In an elastic-fluid turbine, the combination of a bucket-wheel, a nozzle-support which has the same curvature as the wheel and is provided with a number of openings arranged in the same plane, and detachable nozzles which are located in said openings and in close proximity so as to discharge the motive fluid in a solid jet.

4. In an elastic-fluid turbine, the combination of a bucket-wheel, a nozzle-support having the same curvature as the wheel and provided with a number of closely-associated openings which discharge the fluid in a solid column, detachable nozzles located in said openings, and means for securing the nozzles in place.

5. In an elastic-fluid turbine, the combination of a bucket-wheel, a nozzle-support having the same curvature as the wheel and provided with a number of closely-associated openings, nozzles located in said openings which may be removable by moving them in the direction of their length, and individual devices for securing the nozzles in place which are so arranged that one nozzle can be removed without disturbing the other or others.

6. In an elastic-fluid turbine, the combination of a bucket-wheel having peripheral buckets, a nozzle-support which surrounds the wheel and is in proximity thereto, nozzle-receiving openings formed in the support which are closely associated, and a plurality of nozzles located in said openings which are nearer together at their inner than their outer ends, shoulders on the nozzles which determine their positions, and means for securing the nozzles in place.

7. In an elastic-fluid turbine, the combination of a bucket-wheel, a nozzle-support, and a plurality of closely-associated and individually-removable nozzles which discharge fluid to the wheel in the form of a solid jet, the said nozzles being alike in form.

8. In an elastic-fluid turbine, the combination of a bucket-wheel, a nozzle-support, a plurality of closely-associated detachable nozzles which discharge fluid to the wheel in the form of a solid jet, the said nozzles being alike in form, and means for securing the several nozzles to the support.

811,806. MIRROR FOR SURGICAL, DENTAL, AND LIKE USES. ROBERT WALKER, Newark, N. J. Filed Nov. 24, 1905. Serial No. 288,231.

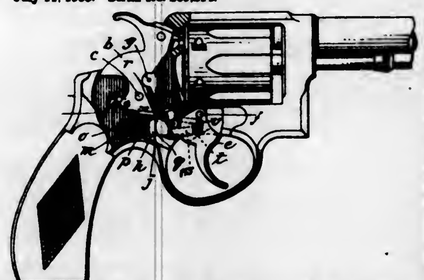
Claim.—1. In a mirror-holder, the combination of a concaved back plate or support and a spring frame or holder adapted to be engaged with and drawn into the support and simultaneously grip the mirror, substantially as described.

2. In a mirror-holder, the combination of a concaved back plate or support and a spring frame or holder having its edge formed to engage the mirror and itself adapted to engage and be drawn into the back plate or support whereby the mirror is simultaneously gripped by the frame, substantially as described.

3. In a mirror-holder, the combination of a concaved back plate or support and a spring-frame having its edge turned over to grip the mirror and itself provided centrally with a stud to engage the back plate or support, whereby the frame is simultaneously caused to grip the mirror, substantially as described.

4. In a mirror-holder, the combination of a concaved back plate or support and a spring frame or holder having its edge turned over to engage the mirror and provided centrally with a screw-threaded stud to engage the back plate or support, substantially as described.

811,807. FIREARM. JOSEPH H. WINSOR, Springfield, Mass. Filed July 11, 1905. Serial No. 269,214.



Claim.—1. In a firearm, a hammer, a trigger, and a retracting device for the hammer consisting of a slidable wedge-block located between the under side of the hammer and the frame, a positive connection consisting of a link extending between said block and the trigger, a spring having a bearing on said block and on a suitable abutment on the frame, to actuate both the block and the trigger.

2. In a revolver, a hammer and a retracting device therefor, and a hand to rotate the cylinder, a trigger, and an elbow-lever pivotally mounted on the latter; one arm of which bears on the hand one side of the pivotal point of the latter, and a link connected to the other arm of the elbow-lever and extending to said retracting device, together with a spring to actuate the latter and the trigger and to hold the hand in operative relation to the cylinder of the revolver.

3. In a revolver, a trigger and a hand thereon to rotate the cylinder, and an elbow-lever pivoted on the trigger one arm of which bears on the hand one side of the pivotal point of the latter, a link pivotally connected to the other arm of the elbow-lever, and a spring to apply endwise pressure to said link to move the trigger in one direction and through said elbow-lever to hold the hand in operative relation to the cylinder of the revolver.

4. In a firearm, a hammer, a trigger, and a retracting device for the hammer, said device having a bearing on and being positively actuated by the trigger but not attached thereto, and a spring to move the retracting device and trigger to retract the hammer after the trigger has been actuated to effect the discharge of the arm.

5. In a firearm, a hammer, a trigger, and a retracting device for the hammer consisting of a slidable wedge-block located between the under side of the hammer and the frame, a connection consisting of a link extending between said block and the trigger, and a spring bearing on the block to move the latter and said trigger to normal position after the trigger has been actuated to fire the arm.

6. In a firearm, a hammer, a trigger, and a retracting device for the hammer consisting of a slidable wedge-block located between the under side of the hammer and the frame, a positive connection consisting of a link extending between said block and the trigger, the rear end of said block being provided with a chamber, a spring in said chamber having a suitable abutment on the frame and serving to actuate both the block and the trigger.

7. In a firearm, a hammer, a trigger, and a retracting device for the hammer connected with the trigger and movable by the latter to inoperative position, said device constituting also a safety device, and a spring bearing on said retracting device and on the frame to normally hold the device in a position to block the fall of the hammer.

811,808. CAR-COUPLING. SOLOMON W. WIBEL and WILLIAM R. CUNNINGHAM, Denver, and HORACE A. GRAY, Arvada, Colo. Filed Jan. 30, 1905. Serial No. 243,173.

Claim.—1. The combination with a draw-head, of a coupling device mounted therein and vertically movable for coupling and uncoupling purposes, the draw-head being also provided with upper and lower spindles provided with projections located within the chamber of the draw-head, and exteriorly-located engaging parts consisting of a cam and an arm, substantially as described.

2. The combination with a draw-head, of a coupling device suitably connected with the draw-head and vertically movable, upper and lower spindles journaled in the draw-head and having interiorly-located projections one of which is adapted to act on the coupling device of the opposite draw-head to hold the latter in the locking position, while the other is adapted to raise the same coupling device to the unlocked position, the two spindles being provided with exteriorly-located engaging parts to facilitate manipulation, for the purpose set forth.

3. The combination with a draw-head having a pin, of a coupling-hook connected with the draw-head and engaging the pin, the said hook being vertically movable for coupling and uncoupling purposes, a second draw-head provided with a pin adapted to be engaged by the coupling-hook of the first-named draw-head, each draw-head being also provided with upper and lower spindles journaled therein and having interiorly-located engaging parts adapted to act on the coupling device for locking and unlocking purposes, the spindles being also provided with exteriorly-located coöperating parts to facilitate manipulation for the purpose set forth.

4. The combination with a draw-head, of a coupling device suitably connected with the draw-head, spindles journaled in the draw-head above and below and having interior projections adapted to act on the coupling device of the opposite draw-head, one of the spindles having an exteriorly-located arm and the other an exteriorly-located cam, the arm and the cam being arranged to coöperate for coupling and uncoupling purposes, the opposite draw-head being provided with a pin adapted to engage the coupling-hook for coupling purposes, substantially as described.

5. The combination of two draw-heads each being provided with a rigid pin, a coupling device having two hook-shaped extremities adapted to engage both pins when the draw-heads are coupled, each draw-head being also provided with upper and lower spindles having projections adapted to act on the adjacent extremities of the coupling device, the spindles being also provided with exteriorly-located engaging parts to facilitate manipulation.

6. The combination with two draw-heads, of a coupling device having hook-shaped extremities adapted to enter the respective draw-heads, devices located in the lower parts of the draw-heads for engaging the coupling-hook extremities, upper and lower spindles journaled in each draw-head and adapted to act on the adjacent extremity of the coupling device for unlocking and locking purposes, the said spindles of the draw-heads being provided with exteriorly-located parts engaging for coupling and uncoupling purposes, the exterior parts on the two draw-heads being located on opposite sides for the purpose set forth.

811,809. EXPLOSIVE-ENGINE. JOSEPH A. WILLIAMS, Cleveland, Ohio. Filed Sept. 27, 1904. Serial No. 226,110.

Claim.—1. The combination with an explosive-engine including a cylinder and a separable stationary combustion-chamber, of means for forcing a scavenging charge of air through the same at a

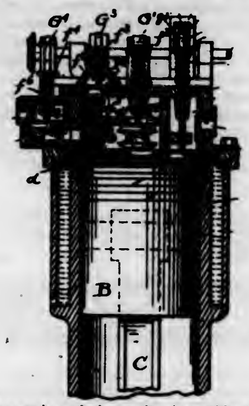
time when the combustion-chamber is not in communication with the cylinder.

2. In an incandescent-lamp guard, the combination with a supporting-base having an upright flange provided with radial lugs

of the cylinder and covering the outlet-ports when in closed position and having one end closed and adapted to rest against said main-

a clamp attached to the beam and holding said sockets in position

time when the combustion-chamber is not in communication with the cylinder.



2. In a four-cycle explosive-engine, in combination, a cylinder, a separable stationary combustion-chamber, and exhaust-passage for the cylinder leading from said combustion-chamber, and means for forcing a scavenging charge of air through said combustion-chamber at a period of the cycle when the engine is not exhausting.

3. In an explosive-engine, in combination, a cylinder, a stationary combustion-chamber, a valve between the same and the cylinder, and means for forcing the air through the combustion-chamber when said valve is closed.

4. In an explosive-engine, in combination, a cylinder, a crank-casing connected thereto, a separable stationary combustion-chamber, a passage-way leading from the crank-chamber to the combustion-chamber, and a valve for controlling said passage-way.

5. In an explosive-engine, in combination, a cylinder, a stationary combustion-chamber, a valve for controlling communication between the two, means for forcing a scavenging charge through the combustion-chamber, a valve for controlling such charge, and means for opening said valve when the combustion-chamber valve is closed.

6. In an explosive-engine, in combination, a cylinder, a crank-casing connected thereto, a separate stationary combustion-chamber, a passage-way leading from the crank-chamber to the combustion-chamber, a scavenging-valve for controlling said passage-way, a partition between the combustion-chamber and cylinder, a valve controlling an opening in said partition, and means for opening the scavenging-valve when the last-mentioned valve is closed.

7. In an explosive-engine, in combination, a cylinder, a combustion-chamber divided into compartments, a valve for controlling communication between the compartments, means for admitting a scavenging charge into the compartment farthest from the cylinder, and means for simultaneously holding open the valve between the compartments, and the exit-valve from the compartment nearest the cylinder.

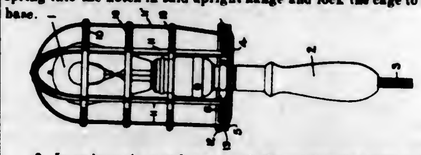
8. In an explosive-engine, in combination, a cylinder, a closed crank-casing connected therewith, a plurality of combustion-chambers communicating with each other and one communicating with the cylinder, an igniter in the combustion-chamber which communicates with the cylinder, a valved exhaust passage-way from said combustion-chamber, means controlling communication between the combustion-chambers, a valved passage-way from the crank-casing leading into the combustion-chamber farthest from the igniter to admit a scavenging charge of air thereto.

9. In an explosive-engine, in combination, a cylinder, a stationary combustion-chamber, a valve controlling communication between the two, a crank-shaft, mechanism operated from the motion thereof to operate said valve, and means for forcing a scavenging charge through the combustion-chamber when the valve is closed.

811,810. LAMP-GUARD. MONTRAVILLE M. WOOD, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed July 11, 1904. Serial No. 213,003.

Claim.—1. In an incandescent-lamp guard, the combination with a supporting-base having a notched flange, of a cage adapted to be secured to said base by a bayonet-joint fastening, and locking means comprising a radially-movable cage-rib capable of engagement with said notched flange.

2. In an incandescent-lamp guard, the combination with a supporting-base having an upright flange provided with radial lugs and a notch, of a cage having a flanged ring containing notches to register with said lugs, and a rib having a loose foot adapted to spring into the notch in said upright flange and lock the cage to the base.



3. In an incandescent-lamp guard, the combination with a supporting-ring 5 having a flange 6 provided with lugs 7, a notch 8, and a bevel 9 adjacent to said notch, of a cage having a loose resilient rib 11', and a ring 12 provided with an internal flange 13 containing notches 14.

811,811. STOPPER FOR BOTTLES. JAMES J. ALLISON, Rockfalls, Ill. Filed May 23, 1905. Serial No. 261,544.

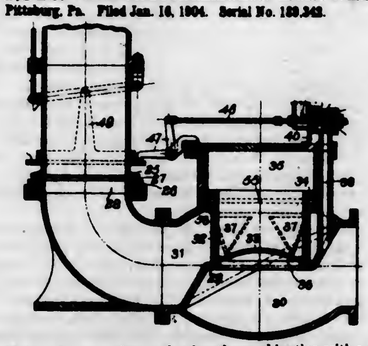
Claim.—1. A stopper for bottles of the class named, comprising a hollow plug, adapted to be held in the neck of the bottle, and provided at its inner end with an inwardly-opening valve; and means for conducting the liquid contents of the bottle from the bottom thereof to the inner end of said plug; substantially as set forth.

2. In a device of the class named, a hollow flexible plug, provided in its inner end with an inwardly-opening valve; a hollow stopper, supported in the neck of the bottle, and embracing the lower part of the plug; and means for conducting the contents of the bottle to the inner end of said plug; substantially as and for the purpose set forth.

3. In a bottle-stopper, the combination of the stopper 2, fixed in the neck of the bottle; the hollow plug 4, embraced by the stopper 2, having an inwardly-opening valve in its inner end, and provided with the sleeve 6 centrally of such plug; and the pipe 3, providing a passage for the contents of the bottle to the plug 4; substantially as shown and set forth.

4. In a device of the class named, the combination of the stopper 2, fixed in the neck of the bottle; the hollow plug 4, embraced by the stopper 2, having an inwardly-opening valve in its inner end; the cap 8, fixed on the top of the bottle, and provided with an opening 9, in line with the opening in the plug 4; and the pipe 3, extending from the lower end of the stopper 2 to the bottom of the bottle; substantially as shown and described.

811,812. STAND-PIPE FOR RAILWAYS. EDWARD V. ANDERSON, Pittsburg, Pa. Filed Jan. 16, 1904. Serial No. 189,342.

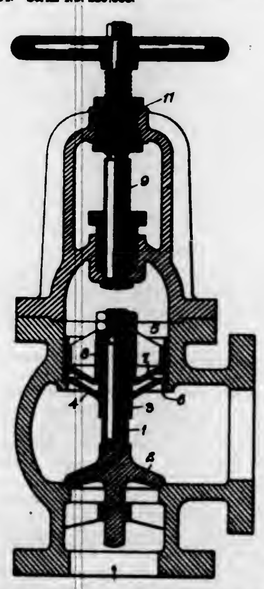


Claim.—1. In a valve mechanism the combination with a casing provided with a valve-seat in its interior, of a hollow cylinder within said casing surrounding said valve-seat at one end and open at its opposite end and having openings at its side for the flow of liquid when the valve is open, a cylindrical valve substantially fitting the interior of the cylinder and covering the outlet-ports when in closed position and having one end closed and adapted to seat against said valve-seat, and means for operating said valve.

2. In a valve mechanism the combination with a casing provided with a valve-seat in its interior, of a hollow cylinder within said casing surrounding said valve-seat at one end and open at its opposite end and having openings at its side for the flow of liquid when the valve is open, a cylindrical valve substantially fitting the interior of the cylinder and covering the outlet-ports when in closed position and having one end closed and adapted to seat against said valve-seat, an operating-cylinder in axial alinement with the first-named cylinder, a piston therein connected to said valve and means for admitting fluid under pressure to the operating-cylinder on the side of the piston opposite said valve and for permitting the escape of said fluid.

3. In a valve mechanism the combination with a casing provided with an internal valve-seat and embodying in its construction two internal hollow cylinders differing in diameter and having a common axis, one end of the smaller cylinder surrounding the valve-seat and its opposite end communicating with the larger cylinder, the smaller cylinder having outlet for the flow of liquid when the valve is open, a combined valve and piston having its valve portion when closed, substantially fitting the smaller cylinder throughout the length thereof and guided thereby and having the end opposite the piston portion constructed to seat on the valve-seat, the piston portion fitting the larger cylinder a passage connecting the larger cylinder with a source of supply and with a waste-passage and a valve for alternately closing said passages.

811,813. VALVE. EDWARD V. ANDERSON, Pittsburg, Pa. Filed Dec. 30, 1904. Serial No. 239,005.

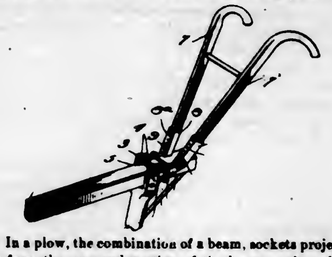


Claim.—1. A check or non-return valve mechanism having in combination a valve, a hollow piston movable with and independent of the valve, a second piston connected to the valve and arranged within the hollow piston, substantially as set forth.

2. A check or non-return valve mechanism having in combination a valve, a piston movable with and independent of the valve, a stop for limiting the movement of the piston and a second piston connected to the valve, substantially as set forth.

811,814. PLOW. JEFFERSON H. BAKER, Collinsville, Tex. Filed Oct. 6, 1905. Serial No. 281,606.

Claim.—1. In a plow, the combination of a beam, a stock applied thereto, sockets secured to the beam near the rear end portion thereof, handles having the lower ends secured to said sockets, and a clamp attached to the beam and holding said sockets in position thereon, the upper portion of the stock being bifurcated to form spaced members upon opposite sides of the beam, said spaced members coacting with the sockets to hold the same in position.

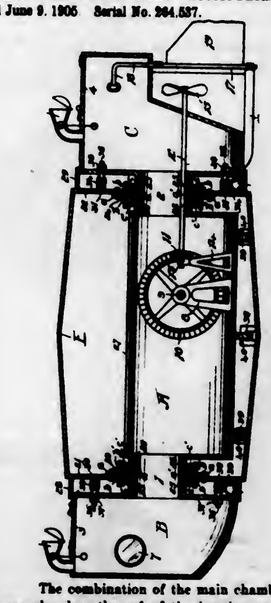


2. In a plow, the combination of a beam, sockets projecting upwardly from the rear end portion of the beam, each socket being formed with an integral foot extending therefrom longitudinally of the beam at a side of the latter, a U-shaped clamp and clamp-plate embracing the rear end portion of the beam and engaging the feet of the sockets to secure the same to said beam, handles having the lower ends thereof mounted in the sockets, and means for securing said handles to the sockets.

3. In a plow, the combination of a beam, sockets arranged at the rear end portion of the beam, handles mounted in said sockets, and a stock attached to the beam and coacting with the sockets to hold the same in position.

4. In a plow, the combination of a beam, sockets arranged at the rear end portion of the beam, handles mounted in said sockets, feet or extensions projected from the sockets and arranged on opposite sides of the beam, said beam being formed with recesses to receive said extensions, a clamp secured to the beam and holding the extensions of the sockets in the recesses in which they are arranged, a stock secured to the beam and having its upper end formed with spaced members engaging the extensions on the sockets and coacting therewith to hold the sockets in position, and a brace between the rear end of the beam and the stock.

811,815. LIFE-SAVING BOAT. AUGUST BAUMGART, Lind, Wash. Filed June 9, 1905. Serial No. 264,537.



Claim.—The combination of the main chamber, of the forward and rear chambers thereof, of the housing or movable cover provided with disks surrounding the main chamber, and an annulus provided with a pair of annular spaces and secured to the disks of said housing.

2. The combination of the main chamber, of the forward and rear chambers thereof, of the housing or movable cover provided

ing series of punch-controlling arms, said arms being formed on the

arranged to convey an elastic medium and project the same upon a

and a coin-slot cover, of a three-armed lever of which one arm en-

2. The combination of the main chamber, of the forward and rear chambers thereof, of the housing or movable cover provided with disks surrounding the main chamber, an annulus or ring approximately in the form of a cross in cross-section secured to said disks, annular or ring plates secured to the ends of the horizontal legs thereof, and forming a pair of annular spaces between the lower vertical leg and said annular spaces.

3. The combination of the main chamber, of the forward and rear chambers thereof, of the housing or movable cover surrounding the main chamber provided with disks, an annulus provided with a pair of annular spaces secured to the disks thereof and a plurality of set-wheels or rollers the periphery thereof working on the outer face of said disks.

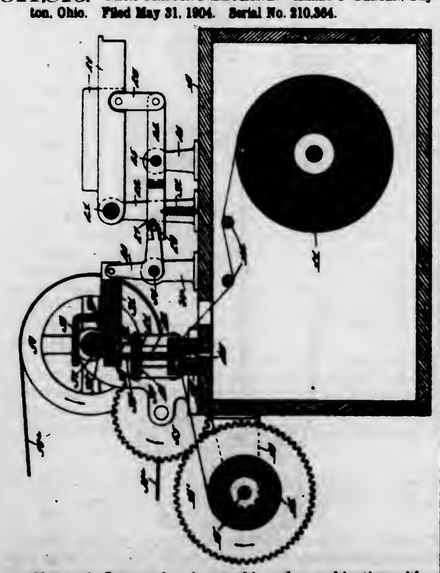
4. The combination of the main chamber, of the forward and rear chambers thereof, of the housing or movable cover surrounding the main chamber provided with disks, an annulus provided with a pair of annular spaces secured to the disks thereof and a plurality of set-wheels or rollers the periphery thereof working on the outer face of said disks and means for adjustably securing said set-wheels or rollers to the forward and rear chambers of the life-boat.

5. The combination of the main chamber, of the forward and rear chambers thereof, of the housing or movable cover surrounding the main chamber provided with disks, an annulus secured to the end disks thereof and provided with annular spaces one of said annular spaces adapted to be filled with packing and the other with roller-bearings to permit the housing or outer movable cover to freely revolve.

6. In combination with the forward and rear chamber of the life-boat and the movable cover or housing thereof provided with disks, a plurality of rollers or set-wheels, the periphery thereof working upon the disks of the aforesaid movable cover, and said rollers or set-wheels being secured to the forward and rear chambers by means of a forked-shaped member, and adjusted by means of a nut or bur.

7. The combination of the main chamber, of the forward and rear chambers thereof, and of the housing or movable cover surrounding the main chamber provided with disks, an annulus provided with a pair of annular spaces secured to the disks of said movable cover or housing, a plurality of set-wheels, the periphery thereof working on the outer face surface of aforesaid disks, and means for adjusting said set-wheels to prevent longitudinal movement of the housing upon the collars communicating with the aforesaid forward and rear chambers.

811,816. **PERFORATING-MACHINE.** HARRY S. BERGEN, Dayton, Ohio. Filed May 31, 1904. Serial No. 210,364.



Claim.—1. In a perforating-machine, the combination with a series of keys, a series of reciprocatory punches corresponding thereto, and means for feeding paper below said punches; of a corresponding series of punch-controlling arms, said arms being formed on the upper side with a cut-away portion adjacent to a raised portion, and formed on the lower side with a slot for engaging the respective punch; an eccentric-shaft extending transversely above said arms; means connected with said keys for operating said arms to carry said raised portion thereof into the path of movement of said eccentric-shaft; and means for rotating said shaft in such direction that the frictional contact of the shaft with said arm assists the key movement of the arm in carrying the raised portion thereof into operative position.

2. In a perforating-machine, the combination with a series of keys, a series of reciprocatory punches corresponding thereto and normally spring-retracted, and means for feeding paper below said punches; of a corresponding series of punch-controlling arms, said arms being formed on the upper side with a cut-away portion adjacent to a raised portion, and formed on the lower side with a slot of such shape as to permit movement of the arm at right angles to the punch independently of the punch, but engaging the punch to cause the latter to follow the arm during its reciprocatory movements in the direction of the reciprocatory movements of the punch; an eccentric-shaft extending transversely above said arms; means connected with said keys for operating said arms to carry said raised portion thereof into the path of movement of said eccentric-shaft; and means for rotating said shaft to cause the reciprocation of the punches when said raised portion of the controlling-arms is in the path of movement of said shaft.

3. In a perforating-machine, the combination with a series of keys, a series of reciprocatory punches corresponding thereto and normally spring-retracted, and means for feeding paper below said punches; of a corresponding series of punch-controlling arms, said arms being formed on the upper side with a cut-away portion adjacent to a raised portion, and formed on the lower side with a slot of such shape as to permit movement of the arm at right angles to the punch independently of the punch, but engaging the punch to cause the latter to follow the arm during its reciprocatory movements in the direction of the reciprocatory movements of the punch; an eccentric-shaft extending transversely above said arms; means connected with said keys for operating said arms to carry said raised portion thereof into the path of movement of said eccentric-shaft; means for rotating said shaft to cause the reciprocation of the punches when said raised portion of the controlling-arms is in the path of movement of said shaft; and a retracting-arm connected with the punch-controlling arm and extending over the upper side of said eccentric-shaft at such distance from the controlling-arm as to permit the free rotation of said shaft between the retracting-arm and the cut-away portion of the controlling-arm without causing the reciprocation of said controlling-arm, but when the controlling-arm is operated by the key, the distance between the retracting-arm and the raised portion of the controlling-arm being such that the said eccentric-shaft will strike both the said raised portion and the said retracting-arm successively in its rotary movement.

4. In a perforating-machine, the combination with a series of keys, and a series of reciprocatory punches corresponding thereto; of a corresponding series of punch-controlling arms, said arms being formed on the upper side with a cut-away portion adjacent to a raised portion, and formed on the lower side with a slot of such shape as to permit movement of the arm at right angles to the punch independently of the punch, but engaging the punch to cause the latter to follow the arm during its reciprocatory movements in the direction of the reciprocatory movements of the punch; an eccentric-shaft extending transversely above said arms; means connected with said keys for operating said arms to carry said raised portion thereof into the path of movement of said eccentric-shaft; means for rotating said shaft to cause the reciprocation of the punches when said raised portion of the controlling-arms is in the path of movement of said shaft; and an intermittent feed and locking device for feeding paper below said punches only when the punches are withdrawn from the paper and for locking the feed while the punches are perforating the paper.

811,817. **MACHINE FOR COMBING WOOL.** ISAAC BENT, Rhode Island. Filed Apr. 12, 1905. Serial No. 255,122.

Claim.—1. In a machine for combing wool the herein-described apparatus adapted to force the wool slivers into the combs by pressure exerted through an elastic medium, comprising means to convey said medium from a source of supply to a position above said slivers, circles of combs, and means to secure the slivers in the combs.

2. In a wool-combing machine, the herein-described apparatus comprising a series of circle combs, a series of conduits adapted and arranged to convey an elastic medium and project the same upon a sliver of wool in a manner that the wool is pressed below the points of the said combs at the meeting place of the circles.

3. In a machine for combing wool the circle combs, the conduits provided with by-passages having terminals adapted for lateral and vertical adjustment in their relation to the combs, and means to vertically and horizontally adjust and support said conduits relative to the tangential junction of the circles.

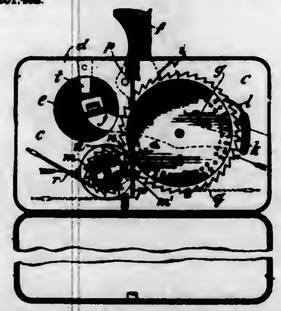
4. In a wool-dabbing apparatus, a series of circle combs, a series of conduits provided with means for deflecting a part of their contents, and having foraminous floors arranged to deliver pressure at a predetermined angle directly to the junction of the circles, a series of by-passages supported by said conduits provided with fan-shaped terminals, and means within said terminal to diffuse the volume of air as it passes to the orifices.

5. A wool-dabbing apparatus composed of a series of members transmitting an elastic medium from a source of supply to the circles of a wool-comb, two or more fan-shaped terminals coacting with said members provided with sinuous partitions, perforations therein to disseminate the volume of pressure into converging and diverging streams to secure an equalized pressure over the wool sliver before it enters the junction of the combs, the circle of combs, and means to maintain the sliver of wool within the said circle.

6. In an apparatus for confining slivers of wool to the combs, two or more main conduits having each flaring orifices covered by foraminous plates, apertures in each plate enlarged to permit egress of an increased volume of pressure over that issuing through the associated perforations, so as to confine the wool at a precise point in the circles, in combination with rotatable means to retain the wool below the points of the combs, the said combs and means for the manual adjustment and maintenance vertically of said rotatable devices and conduits.

7. In combination the circle combs and conduit carrying fluid under pressure, terminals thereto having foraminous barriers and orifices, and provided with means to deflect the fluid-pressure into separate currents, rotatable brushes or aprons for confining the wool below the points after the confinement of the sliver by fluid-pressure, and the presser-feet having means for their axial and vertical adjustment, and adapted to confine the wool to the circles after passing the junction of the combs.

811,818. **MONEY-BOX.** ROBERT H. BISHOP and WILLIAM DOWN, Highgate, England, assignors of two-thirds to Lyonel Edwin Clark and Sydney Francis Stapleton, London, England. Filed Mar. 23, 1905. Serial No. 251,462.



Claim.—1. In a money-box of the kind specified, a counting mechanism, a coin-operated lever for actuating said counting mechanism, and a pivoted coin-slot cover engaging directly with said lever for preventing the passage of the coin into the box when said cover is open.

2. In a money-box of the kind specified, a counting mechanism, a coin-operated lever for actuating said counting mechanism, and a pivoted coin-slot cover engaging with said lever which lever moreover cooperates with the said cover through the medium of a coin, the said coin being caused by the closing of the cover to move the lever to a position to permit the coin to pass into the box.

3. In a money-box, the combination with counting mechanism and a coin-slot cover, of a three-armed lever of which one arm engages with the counting mechanism, another arm serves to prevent the passage of the coin into the box and the third arm engages with the coin-slot cover and is operated by the opening of said cover to prevent the passage of the coin into the box when said cover is open and operated by the closing of said cover with a coin between them to permit the passage of the coin into the box and to actuate the counting mechanism.

811,819. **THERMO-ELECTRIC COUPLE.** WILLIAM H. BRISTOL, New York, N. Y. Filed June 30, 1905. Serial No. 267,834.

Claim.—1. A thermo-electric couple being separable or capable of division between its hot and cold ends.

2. A sectional or separable thermo-electric couple provided with connecting means between the hot and cold ends.

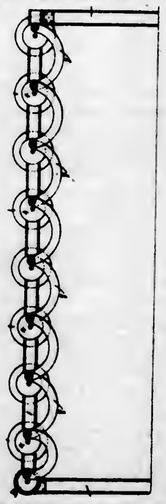
3. A thermo-electric couple comprising a primary section and a secondary section and means adapted to connect said primary and secondary sections between the hot and cold ends of the couple.

4. A thermo-electric couple comprising a primary section and a secondary section, and an open slotted joint adapted to connect the primary and secondary sections between the hot and cold ends of the couple.

5. The combination with an indicating device or recording instrument, of a sectional or separable thermo-electric couple provided with connecting means between the hot and cold ends.

6. The combination with an indicating or recording instrument, of a thermo-electric couple comprising a primary section and a secondary section and means adapted to connect said primary and secondary sections between the hot and cold ends of the couple.

811,820. **ROLLER-TABLE.** HENRY J. BURKHEIM, Pittsburg, Pa. Filed July 8, 1904. Serial No. 215,839.



Claim.—In a roller-table, the combination of a series of rolls adapted for coöperation in feeding material across the table and arranged in the same longitudinal plane, of a driving means at one end of the table, a pitman connecting said driving means to the adjacent roll, and pitmen connecting each of the rolls with the next succeeding roll, each of said pitmen being curved downwardly from its end connection with the rolls, whereby to permit side delivery from the table without interference with the pitmen.

811,821. **DRIER.** HORACE B. CAMP, Akron, Ohio. Filed July 20, 1903. Serial No. 170,568.

Claim.—The combination in a device of the class described com-

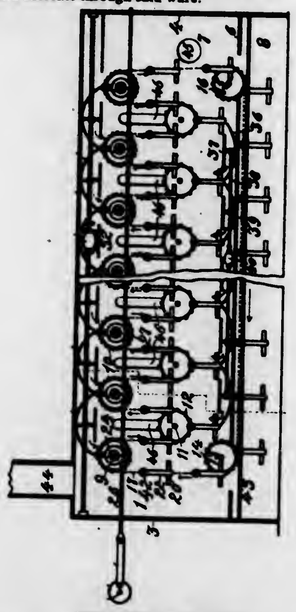
prising an inclosing shell, a plurality of sprocket-wheels mounted in said shell, said sprocket-wheels being arranged in pairs the members of each pair being oppositely disposed with respect to the

tween said lamps and the delivery-chamber aforesaid, substantially as set forth.

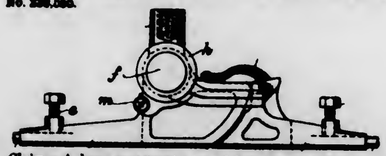
6. The combination with a bottle having a retaining ledge and a rounded head, of a cap having angularly disposed arms with legs

arms, legs depending from the arms, and an expansible ring con-

prising an inclosing shell, a plurality of sprocket-wheels mounted in said shell, said sprocket-wheels being arranged in pairs the members of each pair being oppositely disposed with respect to each other, parallel conveyer-chains arranged to run on said sprocket-wheels, means on said conveyer-chains to support ware-carrying pallets, pallets on said supporting means, means to operate said chains in a step-by-step movement, means to create a plurality of air-currents in said shell adjacent the course of said ware-carrying pallets, and means to direct said currents through said ware.



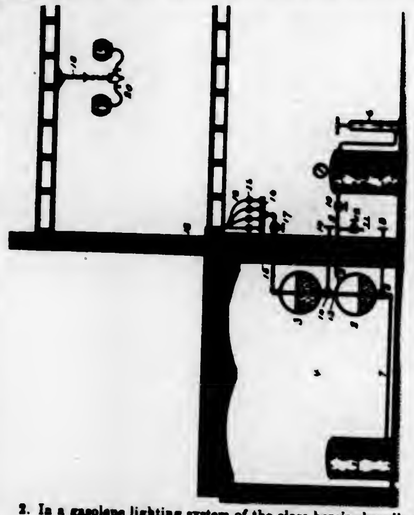
811,822. AUTOMATIC CIRCUIT-BREAKING SAFETY APPLIANCE FOR USE IN TROLLEY-WIRE SYSTEMS FOR ELECTRIC TRACTION. JAMES CARTER, Stalybridge, GEORGE HALL, Manchester, and ARTHUR PARSONS, Leeds, England. Filed Oct. 20, 1904. Serial No. 229,555.



Claim.—A hanger cut-out comprising a support *a*, an arm *b* swiveled intermediate of its ends to said support, the distance from said swivel to one end of said arm being greater than the distance from the swivel to the other arm, so that the one end is heavier than the other, a second arm having a forked end swiveled to said support *a*, the forks thereof inclosing the small end of the other arm, a contact carried by the short end of the first arm, said contact being adapted to engage with the second arm and means for securing line-wires to the free ends of the arms, substantially as described.

811,823. GASOLENE LIGHTING SYSTEM. JOHN B. CHRISTIAN, Minneapolis, Minn. Filed Aug. 3, 1903. Renewed July 19, 1905. Serial No. 270,436.

Claim.—1. In a gasolene lighting system of the class herein described, the combination of a main gasolene-storage chamber, an intermediate receiving-chamber of small capacity connected to the main chamber and adapted to be supplied therefrom by gravity, means for introducing and controlling a supply of compressed air to said intermediate chamber, a delivery-chamber of small capacity connected to said intermediate chamber and adapted to be supplied therefrom, means for controlling communication between the chambers aforesaid, a series of stationary lamps, and pipe connections between said lamps and the delivery-chamber aforesaid, substantially as set forth.



2. In a gasolene lighting system of the class herein described, the combination of a main gasolene-storage chamber free from pressure, an intermediate receiving-chamber of small capacity connected to the main chamber and adapted to be supplied therefrom by gravity, means for introducing and controlling a supply of compressed air to said intermediate chamber, a delivery-chamber of small capacity connected to said intermediate chamber and adapted to be supplied therefrom, means for maintaining pressure in said delivery-chamber, means for controlling communication between the chambers aforesaid, a series of stationary lamps, and pipe connections between said lamps and the delivery-chamber aforesaid, substantially as set forth.

811,824. BOTTLE-CLOSURE. FRANCIS W. H. CLAY, Pittsburg, Pa. Filed Jan. 4, 1905. Serial No. 239,898.

Claim.—1. A bottle closure comprising a body for covering the bottle opening, resilient flat arms on the body at an angle thereto and adapted to bend down, rigid legs on the arms for embracing and engaging the bottle head when the arms are depressed, substantially as described.

2. The combination with a bottle head having a retaining ledge, of a closing cap comprising a body with rigid circumference, flat spring arms outside the circumference set at an angle with the body, depending legs on the arms embracing the bottle head and having catches to engage the ledge, the diameters of the head and cap being such that the angle between the arms and legs is spread when the cap is forced down over the head, substantially as and for the purpose described.

3. The combination with a rounded bottle head having a circumferential ledge 9, of a metallic stopper cap comprising a disk 11, angular resilient flat arms 13 with depending rigid legs 13 and catch lips 15 adapted to engage the ledge.

4. In a bottle closure a disk having upwardly slanting flat arms capable of bending, downturned rigid legs to embrace a bottle head, and means to lock the legs on the head, substantially as described.

5. The combination with a rounded bottle head having a flat top seating surface and an outside annular ledge, of a closing disk having an annular ridge engaging the head, and angularly disposed flat arms with depending legs adapted to engage said ledge and press the ridge downward, the dimensions being such that the legs on the arms are circumferentially spread in springing over the ledge, substantially as described.

6. The combination with a bottle having a retaining ledge and a rounded head, of a cap having angularly disposed arms with legs thereon embracing the head, and retained thereon and exerting resilient pressure thereon, said arms being bent and adapted to be spread by the rounded bottle head to release the cap when the latter is pushed down on the bottle.

7. The combination with a bottle head having a sloping outer surface and a retaining ledge, of a resilient cap with divided sides adapted to engage the head and snap over the ledge, and adapted to be spread and released when said cap is pressed down on the head beyond its elastic limit, substantially as described.

8. The combination with a rounded bottle head having a retaining ledge, of a stopper cap having flat resilient arms with legs thereon engaging the head, the angle between the said arms and legs being sharper than the curve of the head, whereby the legs are spread and released when the cap is pressed down upon the head beyond the elastic limit of the arms and legs.

9. A bottle closing cap having resilient engaging legs substantially as set forth, adapted to lock itself on the bottle head when the legs are pressed downward, and to be released by spreading the legs when pressed further downward upon the bottle head, substantially as described.

10. A bottle closing cap comprising a flat disk, 11, with an annular ridge, 14, and having upwardly bent arms 12, and downwardly bent legs 13 with catch spurs 15, arranged substantially as described.

11. A bottle closing cap having an annular ridge or bead 14 to engage a flat topped surface of a bottle, and resilient means in the cap for exerting pressure on the bead, substantially as described.

12. In a bottle closing cap a series of resiliently-mounted legs for embracing the bottle head and having punched out lips 15 to engage the head, substantially as described.

13. The combination with a bottle head of rounded contour, of a closing cap therefor having resilient members adapted to engage the head when the cap is pressed on, the members having heads adapted to be spread by further pressure down on the head, to thereby release the engaging members.

14. The combination with a bottle head having an anchorage ledge and a rounded top, of a closing cap comprising legs to engage said ledge, a cover part to close the bottle mouth, and flat spring arms on the cover attached to the legs at an angle and adapted to spread said angle as the cap is pushed on the head to engage the legs on said ledge, and to be further depressed on the head and spread the said angle still further and release the legs, substantially as described.

15. The combination with a rounded bottle head having an anchorage ledge, of a closing cap thereon sprung out of normal position and exerting a self induced pressure on the bottle mouth by engagement with said ledge, the engaging part of the cap having a sharper curve than the head and adapted to be further spread to release the engagement by pressing the said part further down on the head, substantially as described.

811,825. BOTTLE-CLOSURE. FRANCIS W. H. CLAY, Pittsburg, Pa. Filed July 15, 1905. Serial No. 269,842.

Claim.—1. In a bottle-closure, in combination with a bottle-head having an anchorage thereon, a cap comprising a part covering the bottle-mouth, a corrugated ring engaging the anchorage, and a connection between said two parts resiliently drawing them together to exert self-induced pressure of the cap itself upon the bottle-mouth.

2. The combination of a bottle-head having an anchorage-ledge with a closing-cap thereon comprising a cover-plate, a resilient expansible ring engaging the ledge and bent portions connecting the plate and ring and resiliently pressing them toward each other, substantially as described.

3. In a bottle-closing cap, the combination of an expansible ring adapted to snap over and engage the head of the bottle, a cover-plate for the mouth of the bottle, and resilient bent members connecting the ring and plate, adapted to be sprung out of normal position in application, whereby the plate is drawn down and the cap exerts self-induced pressure on the bottle-mouth to close it.

4. A bottle-closing cap comprising a cover having spring-arms, legs depending from said arms, and a ring connecting the ends of said legs and adapted to engage the head of the bottle.

5. A bottle-closing cap comprising a cover having resilient arms, legs depending from the arms, and an expansible ring connecting the arms and adapted to automatically engage the bottle-head and by means of said legs to hold the arms sprung out of normal position in application.

6. A bottle-closing cap comprising a cover part, an anchorage part adapted to engage the bottle-head, and a bent part connecting the cover and anchorage part, adapted to have the sides of its bend sprung out of normal position in applying the cap, to thereby resiliently draw the cover and anchorage together and exert pressure of the cover on the bottle-mouth.

7. A bottle-closing cap comprising a part adapted to engage and fasten on the head, a closing cover part for the mouth of the bottle, and resilient members connecting the said cover and anchorage parts adapted to become pressed so as to draw said parts together and exert resilient pressure on the bottle-mouth, whereby no elastic packing is required.

8. The combination with a bottle-head having an anchorage-ledge, of a closure comprising a ring engaging the ledge, a cover for the mouth of the bottle, and parts connecting the ring and cover formed of bent resilient metal and adapted by compression of the bend to draw down the cover toward the anchorage, to make the seal.

9. In a bottle-closure, a cap adapted to fit over the bottle-head and having means to engage the head so as to be retained thereon, and a cover for the bottle-mouth, bent members connecting the said cover part to the engaging means and the bend adapted to be compressed to shorten said connecting members and thereby press the cover down on the bottle-mouth.

10. In a bottle-closure the combination with a bottle-head having an outside retaining-ledge, of a cap having a cover for the mouth of the bottle, a part engaging said retaining-ledge, and resilient bent portions connecting the cover and retaining part and adapted to be compressed in order to draw the cover down on the bottle-mouth.

811,826. PROCESS OF MAKING 4-IMINO-2-6-DIOXYPYRIMIDIN. MAX CONRAD, Aschaffenburg, and WALTER BECKH, Darmstadt, Germany. Filed Nov. 3, 1904. Serial No. 231,267.

Claim.—1. The process of producing 4-imino-2.6-dioxypyrimidin, which process consists in condensing urea and cyanacetic-acid ester in the presence of an alkali-condensing agent, substantially as described.

2. The process of producing 4-imino-2.6-dioxypyrimidin, which process consists in condensing urea and cyanacetic-acid ethylester in the presence of an alkali-condensing agent, substantially as described.

811,827. PROCESS OF MAKING PYRIMIDIN DERIVATIVES. MAX CONRAD, Aschaffenburg, and WALTER BECKH, Darmstadt, Germany. Original application filed Nov. 3, 1904, Serial No. 231,267. Divided and this application filed Oct. 21, 1905. Serial No. 283,767.

Claim.—1. The process of producing 4-imino-2.6-dioxypyrimidin, which process consists in condensing acidyl derivatives of urea with cyanacetic-acid esters in the presence of alkali-condensing agents.

2. The process of producing 4-imino-2.6-dioxypyrimidin, which process consists in condensing acetyl-urea with cyanacetic-acid ester in the presence of an alkali-condensing agent.

3. The process of producing 4-imino-2.6-dioxypyrimidin, which process consists in condensing acetyl-urea with cyanacetic-acid ethyl ester in the presence of an alkali-condensing agent.

811,828. PROCESS OF MAKING PYRIMIDIN DERIVATIVES. MAX CONRAD, Aschaffenburg, and WALTER BECKH, Darmstadt, Germany. Original application filed Nov. 3, 1904, Serial No. 231,267. Divided and this application filed Oct. 21, 1905. Serial No. 283,766.

Claim.—1. The process of producing alkyl-4-imino-2.6-dioxypyrimidins having the above-given general formula, which process consists in condensing alkyl-ureas of the above-characterized kind and cyanacetic-acid esters in the presence of alkali-condensing agents, substantially as described.

2. The process of producing alkyl-4-imino-2.6-dioxypyrimidins having the above-given general formula which process consists in condensing alkyl-ureas of the above-characterized kind and cyanacetic-acid ethyl ester in the presence of alkali-condensing agents, substantially as described.

3. The process of producing 3-methyl-4-imino-2.6-dioxypyrimidin, which process consists in condensing methyl-urea with cyanacetic-acid ethyl ester in the presence of an alkali-condensing agent, substantially as described.

811,829. PROCESS OF MAKING PYRIMIDIN DERIVATIVES. MAX CONRAD, Aschaffenburg, and WALTER BECKH, Darmstadt, Ger-

said plate and coöperating therewith, and a port in said plate arranged to register with said auxiliary passage

joined by means of hinges, a pivoted door or gate secured to each of

811,833. PACKING FOR ELASTIC-FLUID TURBINES. WIL-

811,829. **PROCESS OF MAKING PYRIMIDIN DERIVATIVES.** MAX CONRAD, Aschaffenburg, and WALTER BECKH, Darmstadt, Germany. Original application filed Nov. 3, 1904, Serial No. 231,267. Divided and this application filed Oct. 24, 1905. Serial No. 283,709.

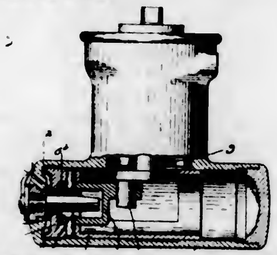
Claim.—1. The process of producing alkyl-4-imino-2.6-dioxypyrimidins of the above-given general formula, which process consists in condensing acidyl-alkyl-ureas of the above-characterized kind and cyanacetic-acid ester in the presence of alkali-condensing agents and contemporary splitting off of the acidyl groups.

2. The process of producing alkyl-4-imino-2.6-dioxypyrimidins of the above-given general formula, which process consists in condensing acetyl-alkyl-ureas of the above-characterized kind with cyanacetic-acid esters in the presence of alkali-condensing agents.

3. The process of producing alkyl-4-imino-2.6-dioxypyrimidins of the above-given general formula, which process consists in condensing acetyl-alkyl-urea of the above-characterized kind with cyanacetic-acid ethyl ester in the presence of an alkali-condensing agent.

4. The process of producing 3-methyl-4-imino-2.6-dioxypyrimidin, which process consists in condensing acetyl-methyl-urea with cyanacetic-acid ethyl ester in the presence of an alkali-condensing agent.

811,830. **VALVE FOR DOOR-CHECKS.** NATHAN W. CRANDALL, New Britain, Conn., assignor to Russell & Erwin Manufacturing Company, New Britain, Conn., a Corporation of Connecticut. Filed Oct. 5, 1904. Serial No. 227,198.



Claim.—1. In a liquid door-check, a piston having a passage through its head and an auxiliary passage adjacent thereto, a valve having a hub thereon projecting through said passage in said piston-head and having a port arranged to register with said auxiliary passage through said head and a plug mounted in the check-case and engaging with said valve whereby the angular position of the latter may be varied to increase or diminish the cross-sectional area of the fluid-passage formed by the said auxiliary passage and the port in said valve.

2. In a liquid door-check, a piston provided with a passage through its head and having an auxiliary port therein, an open valve-body loosely seated in said passage and constructed to take a flat seat against the front face of the piston-head and to automatically open when the piston is moved in one direction, and to automatically close when the piston is moved in the opposite direction, said valve-body having a port located to register with the auxiliary port of the piston-head, and means to vary the operative position of the valve for the purpose described.

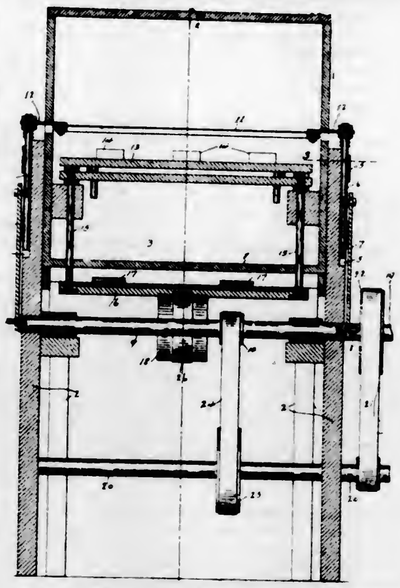
3. In a liquid door-check, a piston, a valve loosely mounted in the head of said piston and arranged to bear flatwise against an outer seat thereon when the piston is moved in one direction and to become freed from said seat when the piston moves in an opposite direction, an auxiliary liquid-passage through said valve and piston-head, means for adjusting said valve by rotation to increase or diminish the cross-sectional area of said auxiliary passage.

4. In a liquid door-check, a piston, a valve loosely mounted in the head of said piston and arranged to bear flatwise against an outer seat thereon when the piston is moved in one direction and to become freed from said seat when the piston moves in an opposite direction, an auxiliary liquid-passage through said valve and piston-head, means for adjusting said valve to increase or diminish the cross-sectional area of said auxiliary passage, said means comprising a rotatable plug carried by the check-casing and engaging said valve but non-rotatable independently thereof.

5. In a liquid door-check, a piston, a main passage and an auxiliary passage through the piston-head, a valve for both of said passages comprising a plate loosely held by said piston-head and overstanding said auxiliary passage and a rotatable plug loosely fitting said plate and coöperating therewith, and a port in said plate arranged to register with said auxiliary passage.

6. In a liquid door-check, a piston having a main and an auxiliary passage through its head and a concentric groove of gradually-decreasing cross-sectional area extending from said auxiliary port to the surface of the head, a valve for both of said passages comprising a plate loosely held by said head and overstanding said auxiliary passage, a rotatable plug loosely fitting said plate, the latter having a port arranged to register with said auxiliary passage, and means for adjusting said rotatable plug to change the operative position of said valve.

811,831. **BRUSH-FILLING MACHINE.** FRANK C. CURTIS, Troy, N. Y., assignor to The Universal Brush Company, a Corporation of New York. Filed Apr. 1, 1905. Serial No. 253,221.



Claim.—1. In a machine of the class described, the combination with a bristle-feeding bristle-agitator; of a support for a bristle-receiving plate below the agitator; and means for imparting to said support jarring movements independently of the movements of said agitator.

2. In a machine of the class described, the combination with a bristle-feeding bristle-agitator; and mechanism for agitating the same; of a support for a bristle-receiving plate below the agitator; and means for imparting to said support jarring vertical movements of less amplitude than the movements of said agitator.

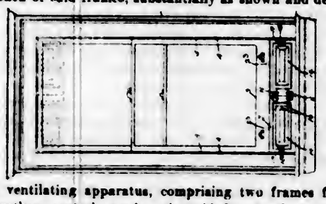
3. In a machine of the class described, the combination with a bristle-feeding bristle-agitator; and mechanism for agitating the same; of a support for a bristle-receiving plate below the agitator; and means for imparting to said support jarring vertical movements differing in time from the movements of the agitator.

4. In a machine of the class described, the combination with a bristle-feeding bristle-agitator; and mechanism for agitating the same; of a support for a bristle-receiving plate below the agitator; and means for imparting to said support jarring vertical movements differing in time and amplitude from the movements of the hopper.

5. In a machine of the class described, the combination with a bristle-feeding bristle-agitator; and crank mechanism for agitating the same; of a bristle-receiving plate having a plurality of bristle-recesses; a support for the plate below the agitator; and a cam adapted to impart to said support jarring movements at variance with the movements of the agitator.

811,832. **VENTILATING APPARATUS.** HARRY DE WALLACE, Watertown, N. Y. Filed Jan. 26, 1905. Serial No. 242,868.

Claim.—1. A ventilating apparatus, comprising two frames joined by means of hinges, a pivoted door or gate secured to each of said frames, a catch provided on each door or gate adapted to hold the same in a closed position, a pair of rearwardly-projecting wings or flanges secured to the horizontal edges of said doors, and at right angles to the plane of said door or gate, and a screen secured to the back of each of said frames, substantially as shown and described.



2. A ventilating apparatus, comprising two frames foldably joined together, central openings in said frames, doors or gates adapted to fit and close said openings, hinges connecting said doors or gates to said frames, wings or flanges secured to the horizontal edges of said doors or gates, screens attached to the back of the frames and adapted to limit the movement of said doors or gates, substantially as shown and described.

3. A ventilating apparatus, comprising two frames hinged together and adapted to be attached to a window-frame, a central opening in each of said frames, doors or gates pivotally joined to said frames and adapted to fit and close said openings to prevent the admission of air into a room, and also adapted to be swung open for the purpose of admitting air into a room, a latch on each door adapted to hold the same in a closed position, a pair of wings secured to the opposite edges of each door, a lug or angular projection formed on each wing adapted to limit the movement of a door, and a screen disposed across the central opening of each frame, all substantially as and for the purposes described and shown.

4. A ventilating apparatus, comprising two frames hinged or pivoted together, central rectangular openings formed in said frame, doors or gates hinged to said frames and adapted to admit or exclude a volume of air, wings secured to the outer side of each door or gate and adapted to confine the flow of air to a channel formed by said wings and said door or gate, a screen secured to the back or weather side of each frame adapted to exclude insects, snow and sleet from a room, and means for attaching said ventilating apparatus to a window-sash, substantially as shown and described.

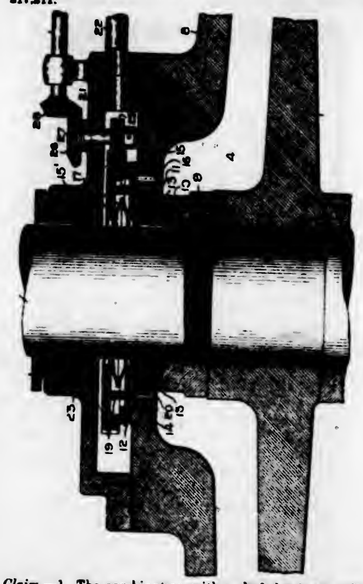
5. A ventilating apparatus, comprising a pair of rectangular frames of equal size joined together by means of a hinge or hinges, the abutting ends of said frames being reversely rabbeted to prevent the leakage of air through said joint, a central rectangular opening in each of said frames, and a movable door or gate hinged or pivoted to each of said frames whereby either or both of said rectangular openings may be opened or closed for the purpose of admitting or excluding a volume of air, substantially as shown and described.

6. A ventilating apparatus, comprising two frames foldably hinged together, the combined length of said frames being equal to the width of a window-sash, a rectangular opening formed in the center of each of said frames, a door or gate hinged on one side, and adapted to close or open the rectangular opening, of each of said frames, for the purpose of admitting or excluding a volume of air, and a screen upon the back of each of said frames and extending across said rectangular opening, adapted to prevent the admission of insects, &c., substantially as shown and described.

7. A ventilating apparatus, comprising two frames having barbeted ends and joined together by means of hinges, a central opening in each frame, a gate or door hinged to each frame and adapted to be operated to close said opening for the purpose of excluding fresh air from a room, and also adapted to be swung open on said hinges for the purpose of admitting air of any desired volume into a room, a pair of wings or flanges oppositely disposed upon the rear surface of each door or gate adapted to form a channel for the flow of a current of air into a room or compartment, a lug disposed at right angles to each of said wings or flanges, and a screen secured to the back and across the central opening in each frame, adapted to prevent the opening of said doors or gates beyond a certain limit, substantially as shown and described.

8. A ventilating apparatus, comprising two frames pivotally joined together and adapted to be placed in a window either above or below, and in line with the sash thereof, devices adapted to form a connection between the ventilating apparatus and a window-sash, and a pair of doors or gates pivotally mounted upon said apparatus for the purpose of regulating the flow of air into or from a room, substantially as shown and described.

811,833. **PACKING FOR ELASTIC-FLUID TURBINES.** WILLIAM L. R. EMMET, Schenectady, N. Y., assignor to General Electric Company, a Corporation of New York. Filed July 19, 1904. Serial No. 217,211.



Claim.—1. The combination with a shaft having a collar, of a packing-ring resting on said collar, an annular holder for said ring, a gland surrounding said holder, and springs between said gland and holder.

2. The combination with a shaft having a collar, of a packing-ring resting on said collar, an annular holder for said ring having a flange bearing thereon, a gland surrounding said holder and having a flange, a steam-tight connection between said flanges, and ports leading into the space between said flanges.

3. The combination with a shaft having a collar provided with radial grooves, of a carbon packing-ring resting on said collar, an annular holder for said ring having a flange bearing thereon and ports passing through it, a gland splined on said holder and having a flange, and a steam-tight connection between said flanges.

4. The combination with a shaft having a collar provided with radial grooves, of a carbon packing-ring resting on said grooved collar, an annular holder for said ring provided with ports and having a flange bearing on said ring, a gland splined on said holder and having a flange, a steam-tight connection between said flanges, and springs between said flanges.

5. The combination with a shaft having a collar provided with narrow radial grooves running from the outside partly across the same, of a carbon packing-ring resting both on the grooved and ungrooved surface of the collar, and means for exerting a pressure on said ring.

6. The combination with a shaft having a collar, of a carbon packing-ring resting thereon, and an annular holder having a flange bearing on the ring and containing radial grooves running part way across the ring.

7. The combination with a shaft having a collar, of a packing for said shaft resting on said collar, a rotatable screw-threaded gland, springs between said gland and packing, a casing inclosing said parts, and means for rotating said gland from outside said casing.

811,834. **STAIR-TREAD.** CHARLES W. ENGLEHEIM, Newark, N. J., assignor of one-half to Adolph B. Fink, Newark, N. J. Filed June 14, 1905. Serial No. 265,118.

Claim.—1. A stair-tread comprising a plate provided with a top portion and a front downwardly-extending portion, said portions having an opening, downwardly-extending prongs on the edges of the plate bordering the part of the opening in the top portion and laterally-extending prongs on the edges bordering the part of the opening in the front portion, substantially as described.

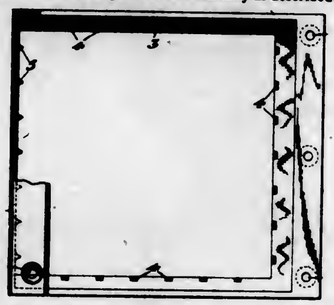
2. A stair-tread comprising a plate provided with a top portion and a front downwardly-extending portion, said portions having an opening, prongs on the edges of the plate bordering the opening in the top portion and front portion, substantially as described.

or away from said side of the frame, a table-top pivotally connected with said table-base near the inner edge thereof, and adjusting means connecting the table-top and table-base, whereby the inclination of

having a part projecting beyond its insulating-ring to engage with the gasket whereby a water-tight joint is formed, substantially as described.

outer cavity, two metallic leading-in strips, one at each end, and each extending from an outer cavity through one of said openings into the corresponding inner cavities, means within each inner cavity

2. A stair-tread comprising a plate provided with a top portion and a front downwardly-extending portion, said portions having an opening, prongs on the edges of the plate bordering the opening in the top portion and front portion, substantially as described.



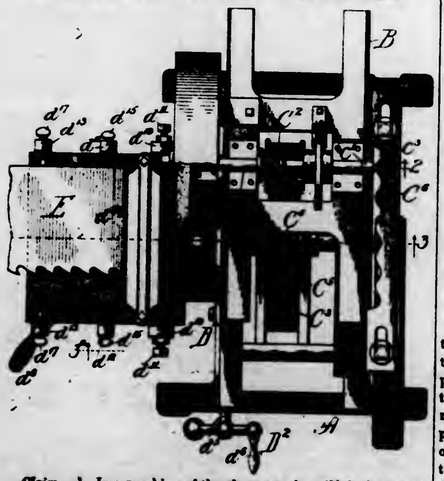
3. A stair-tread comprising a plate provided with a top portion and a front downwardly and inwardly extending portion, said portions having an opening, prongs on the edges of the plate bordering the opening in the top portion and front portion, substantially as described.

4. A stair-tread comprising a plate provided with a top portion and a front downwardly-extending portion, said portions having an opening and a groove in their under face bordering said opening and prongs on the edges of the plate bordering the opening in the top portion and front portion, substantially as described.

5. A stair-tread comprising a plate provided with a top portion and a front downwardly and inwardly extending portion said portion having an opening, downwardly-extending prongs on the edges of the plate bordering the part of the opening in the top portion and laterally-extending prongs on the edge of the plate bordering the part of the opening in the front portion, substantially as described.

6. A stair-tread comprising a plate provided with a top portion and a front downwardly and inwardly extending portion, said portions having an opening and a groove in their under face bordering said opening, downwardly-extending prongs on the edges of the plate bordering the part of the opening in the top portion and laterally-extending prongs on the edges of the plate bordering the part of the opening in the front portion, substantially as described.

811,835. SAW-DRESSING MACHINE. LARS L. FILSTRUP, Chicago, Ill., assignor to Covel Manufacturing Company, Chicago, Ill., a Corporation of Illinois. Filed Mar. 1, 1904. Serial No. 196,003.



Claim.—1. In a machine of the character described, the combination of a frame, a table-support connected therewith and provided with a horizontal guide projecting perpendicular to the adjacent side of the frame, a table-base mounted on said guide to move toward or away from said side of the frame, a table-top pivotally connected with said table-base near the inner edge thereof, and adjusting means connecting the table-top and table-base, whereby the inclination of the table-top may be varied, for the purpose set forth.

2. In a machine of the character described, a table-support equipped with a guide, a table-base mounted on said guide and provided at the inner portion with pivot-supports, interchangeable table-tops provided at their inner portions with means for attaching them to said pivot-supports, and means at different positions on the table-base for securing the outer portions of the table-tops, whereby either table-top may be used, as desired.

3. In a machine of the character described, the combination of a table-support equipped with a horizontal guide, a table-base mounted on said guide, means for moving the table-base on its guide, pivot-supports at the lateral edges of the inner portion of the table-support, a table-top pivoted thereon at its inner end, means for adjusting the outer end of the table-top vertically, and means for clamping the table-top to the table-base after adjustment of inclination, for the purpose set forth.

4. The combination of a table-support provided with a guide, a table-base adjustably connected with said guide, a table-top pivotally connected with the inner end of said table-base, an adjusting-screw for varying the height of the outer end of the table-top with relation to the table-base, and clamping-screws serving to secure the table-top to the table-base after adjustment of the inclination of the table-top.

5. A table-base for a machine of the character described, comprising a horizontal member provided at its inner end with lateral upturned pivotal lugs, intermediately with lateral upturned lugs for securing the outer end of a relatively short table-top, and at its outer end with lateral upturned lugs for securing the outer end of a relatively long table-top.

6. The combination with the frame and grinding-wheel of a machine of the character described, of a table-support adjustable vertically with relation to the frame, and provided with a guide at right angles to the grinding-wheel, a table-base adjustably connected with said guide, and interchangeable table-tops for said table-base, for the purpose set forth.

7. A table-base for the purpose set forth, comprising a member equipped with guide-connecting means and provided at its inner end with a pair of relatively high perforate pivotal lugs, intermediately with a pair of relatively low perforate securing-lugs, and at its outer end with a pair of perforate securing-lugs of intermediate length, for the purpose set forth.

8. In a machine of the character described, the combination with the frame thereof, of a vertically-movable table-support, a vertical screw connected therewith and equipped with a worm-wheel, and a horizontal worm engaging said worm-wheel and provided with a stem projecting past one end of the frame and equipped with a handle, for the purpose set forth.

811,836. ELECTRICAL HOSE-SIGNALING APPARATUS. WILLIAM FOWLER, Colorado Springs, Colo. Filed June 14, 1904. Serial No. 212,585.

Claim.—1. In electrical hose-signaling apparatus, the combination of coupling members equipped with insulating-rings, two contact-rings located in the insulating-ring of one member, two contact-pins located in the insulating-ring of the other member and adapted to engage the rings of the first-named member, three conductors mounted on the line of hose, two of them being connected with the pins of one coupling member, and two of them with the rings of the other coupling member, while the third conductor is connected with the body of each coupling member, a revoluble ring carried by one of the coupling members, said ring having an annular recess therein and a gasket in said recess, said gasket being located outside of the insulating-ring of the member which carries the revoluble ring and being engaged by the end of said member and the cooperating member having a part projecting beyond its insulating-ring to engage with the gasket whereby a water-tight joint is formed, substantially as described.

2. In apparatus of the class described, a hose-coupling consisting of two cooperating coupling members equipped with insulating-rings and contact devices for completing a signaling-circuit through the coupling, a ring having an annular recess therein carried by one member and a gasket carried in said recess and having a portion located outside of the insulating-ring of one coupling member and engaged by both coupling members for the purpose of making a water-tight joint, the gasket being located beyond and separated from the waterway of the coupling.

3. The combination of a line of hose carrying three electrical conductors, contacts mounted on one member of the coupling of the hose and exteriorly exposed, the said contacts being connected with two of the conductors of the line and insulated from the coupling member, the third conductor of the line being connected with the body of the coupling member, the said coupling member having a projection located between the insulated contacts, an electrical key provided with spring-actuated contacts adapted to engage the insulated contacts of the coupling member, the said key having a third contact shaped to receive the projection of the coupling member which projection is provided with a recess, means mounted on the key whereby the latter is made to interlock with the projection of the coupling member comprising a spring-actuated pawl adapted to enter the recess of the said projection, branch conductors leading from the several contacts of the electrical key, and a portable bell or signal device with which the branch conductors are suitably connected.

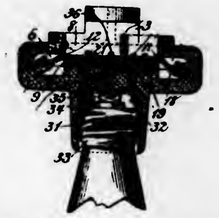
4. The combination with a line of hose provided with three electrical conductors leading to one of the coupling members, exposed contacts mounted on one of the coupling members to which two of the conductors of the line lead, the third conductor leading to the body of the coupling member, the latter having a projection provided with a recess an electrical key having three contacts insulated from each other and adapted to form electrical connection on the coupling member with the three conductors of the line, one of the contacts consisting of a thimble adapted to receive the projection of one of the coupling members, the key being provided with a spring-actuated pawl adapted to engage the recess of the coupling-member projection, three branch conductors leading from the contacts of the electrical key, a portable bell to which the three branch conductors lead, a revoluble spool upon which the bell mechanism is mounted, a casing in which the spool is located, the conductors being adapted to wind on the spool which is spring-actuated for the purpose, a portable battery, two insulated contact-rings mounted on the spool and connected with the respective poles of the battery, and suitable connections whereby as the push-button or circuit-closer of the bell is closed, the the bell mechanism is in circuit with the battery.

5. The combination with a line of hose provided with three electrical conductors leading to one of the coupling members, two of the said conductors being insulated from the coupling member, while the other conductor is connected with the said member, the latter having a projection provided with a recess; an electrical key adapted to be connected with the coupling member and having three contacts insulated from each other and adapted to form a suitable electrical connection on the coupling member with the three conductors of the line, one of the conductors forming a socket adapted to receive the projection of one coupling member the key having a spring-actuated pawl adapted to engage the recess of the coupling-member projection, three branch conductors connected with the contacts of the key, a bell or signal device with which the three branch conductors are suitably connected, and a spool mounted on the bell-casing and upon which the three conductors of the electrical key may be wound for the purpose set forth.

6. An apparatus of the class described, the combination with a hose and a coupling member connected therewith, of an insulating-ring with which the coupling member is provided, threaded contacts inserted in the coupling member and entering the insulating-ring to hold the latter in place, the said contacts being exposed at the outer surface of the member and being insulated from the metal part of the latter, and conductors connected with the said contacts, substantially as described.

811,837. SUPPORT FOR INCANDESCENT LAMPS. ERWIN R. GILL, Yonkers, N. Y. Filed Jan. 17, 1905. Serial No. 241,663.

Claim.—1. In a device of the class described a wall-section having a pair of electrically-separated cavities on its inner side and a corresponding pair of electrically-separated cavities on its outer side and having openings joining each inner cavity to its corresponding outer cavity, two metallic leading-in strips, one at each end, and each extending from an outer cavity through one of said openings into the corresponding inner cavities, means within each inner cavity for making electrical connection between each leading-in strip and an electric wire, a lamp-supporting section fitting over said wall-section, a lamp-socket thereon, and means for making electrical connections between each of said leading-in strips and said socket, substantially as described.

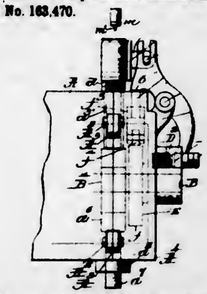


2. In a device of the class described, a wall-section and a lamp-supporting section made each with a flat face to fit the other and each having two open cavities in said faces pierced on opposite sides with semicircular openings, insulated electric wire passing through and fitting said openings and having each a bare portion within its appropriate cavity, a lamp-socket on the outer side of the lamp-supporting section, a threaded shell in said socket, a central screw having its head in the bottom of said socket and extending through both sections of the entire device, a side screw passing through the edge of said shell and through both sections of the device and leading-in strips extending from the threaded tips of said two screws to the bare parts of said insulated wires, substantially as described.

3. As an article of manufacture, a support for incandescent lamps comprising the following parts, to wit: a wall-section having an inner flat face with a cavity at each end semicircularly pierced on the opposite sides and having corresponding cavities on its under side separated by an insulating-partition and each communicating by an opening with its corresponding inner cavity; in combination with a lamp-supporting section having a flat inner face with cavities semicircularly pierced on opposite sides, all to register with the inner cavities on the wall-section, and a socket on the outer side of said lamp-supporting section, substantially as described.

4. In a device of the class described, a wall-section having an insulating-partition on its under side, two leading-in strips extending outward from the foot of said partition, permanent retaining-screws passing through the body of said wall-section and said leading-in strips, a lamp-supporting section fitting over said wall-section and provided with cavities to go over the heads of said screws and two connecting and securing screws passing through both of said sections and screwing into said two strips, substantially as described.

811,838. MACHINE FOR INSERTING LACING-STUDS. PERLEY R. GLASS, Quincy, Mass., assignor to The Peerless Machinery Company, Boston, Mass., a Corporation of Massachusetts. Filed June 29, 1903. Serial No. 163,470.



Claim.—1. In a machine of the class described, a clenching member, a plunger, a hook-sustaining plate carried by said plunger, means to supply said hook-sustaining plate with hooks when the plunger occupies one of its extreme positions, means to move the plunger after supplying said plate with a hook, and means to slide said plate transversely with relation to the longitudinal axis of said plunger, to withdraw the plate from a set hook before the return of the plunger to its starting-point.

2. In a machine of the class described, a movable plunger grooved at its end, a hook-sustaining plate carried by said plunger and having its upper side located in a plane below the upper end of said plunger, and means to slide said plate transversely with relation to the longitudinal axis of said plunger to withdraw the same from the throat of a set hook while the upper end of the plunger contacts with the stock in which the hook has been set.

3. In a machine of the class described, a plunger, means to raise and lower the same, a hook-sustaining plate mounted at the end of and guided by said plunger, a lever in operative engagement with said plate at both extreme positions of the plunger, and means to move said lever to slide said plate transversely to said plunger at the end thereof to withdraw said plate from a set hook.

4. In a machine of the class described, a plunger, a hook-sustaining plate guided by said plunger and located at one end thereof, and means controlled by a spring to maintain the end of said plate in normal position to receive the throat of a hook.

5. In a machine of the class described, a plunger, means to reciprocate said plunger, a hook-sustaining plate guided at the end thereof, and means coacting with said plate to move the same transversely with relation to the longitudinal axis of said plunger to withdraw said plate from the throat of a set hook

6. In a machine of the class described, the combination with a plunger, of a hook-sustaining plate, a lever, and a spring to move it to cause said plate to enter the throat of a lacing-hook, and a continuously-moving actuator to act upon said lever after setting the hook to withdraw said sustaining-plate from the throat of the hook.

7. In a machine of the class described, a raceway, a clenching device, a plunger having a guideway, a hook-sustaining plate slidably mounted at the end of said plunger, and means to slide automatically said plate controlled in its direction of movement by said guideway, the plate being moved transversely to the longitudinal axis of said plunger.

8. In a machine of the class described, a plunger, a hook-sustaining plate located at the end thereof and notched at its edge to receive the neck of the hook as the throat of the hook to be set comes onto the edge of said plate, and means to slide automatically said plate at right angles to the longitudinal axis of said plunger to withdraw said plate from the throat of the hook after the latter has been set in the stock.

9. In a machine for setting lacing-hooks, a plunger having a recess at its upper end to receive the head of a hook, said recess being wider than the width of the head of the hook to be set, a hook-sustaining plate slidably sustained by said plunger and having its hook-receiving edge in and crossing said groove, said plate having a notch in its edge to receive the neck of the hook as the latter comes into setting position on said plate, and means to automatically move said plate outwardly in said plunger to withdraw the plate from the throat of the hook after the same has been set in the stock that the hook and plunger may be separated one from the other.

10. In a machine of the class described, a raceway, a clenching device, a plunger having its upper end recessed to form a space for the reception of the head of a lacing-hook, a slidable hook-sustaining plate sustained at the upper end of said plunger, the end of said plate being adapted to be embraced by the throat of the hook to be set, means to actuate said parts to effect the thrusting of the shank of the hook through the stock that the clenching device may expand the shank of the hook, and means to move said plate in said plunger at right angles to the longitudinal axis thereof to withdraw said plate from the throat of said hook preparatory to lowering the plunger.

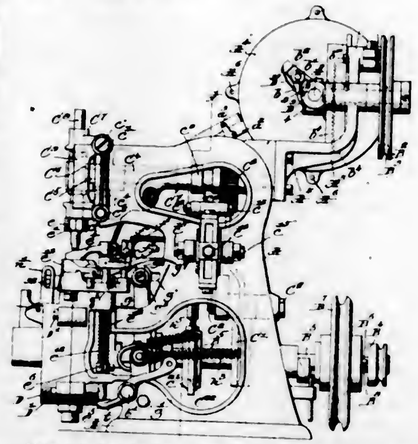
11. In a hook-setting machine, a plunger having a horizontal guideway and a hook-receiving space, and a hole for a guide-rod, combined with a hook-sustaining plate located in said guideway, and provided with a guide-rod entering the hole of said plunger.

12. In a hook-setting machine, a plunger and a carrying member therefor, means to adjust the plunger on the carrying member, a hook-sustaining plate carried by said plunger, and means to move said plate substantially at right angles to the longitudinal axis of said plunger to withdraw said plate from a set hook.

13. In a hook-setting machine, a plunger, means to move the same longitudinally, a hook-sustaining plate guided in the upper portion of said plunger, a lever mounted on the framework of the machine, said lever being loosely connected at its upper end with said hook-sustaining plate, and means to move said lever to withdraw the hook-sustaining plate from the throat of the set hook.

14. In a machine of the class described, a raceway, a plunger, means for carrying said plunger, means for adjusting said plunger on said carrying means, means for holding said plunger in its adjusted position in said carrying means, a hook-sustaining plate guided at the end of said plunger and adapted to receive a hook from said raceway, a clenching device to set in stock the shank of a hook held by said plate, and means to thereafter slide said plate transversely to the longitudinal axis of said plunger to withdraw said plate from the throat of the set hook.

811,839. **MACHINE FOR SETTING LACING HOOKS OR STUDS.** PERLEY R. GLASS, Quincy, Mass., assignor to The Peerless Machinery Company, Boston, Mass., a Corporation of Massachusetts. Filed Oct. 23, 1903. Serial No. 178,941.



Claim.—1. In a hook-setting machine, a plunger, and a movable hook-sustaining plate mounted therein and provided at its upper side with a setting-pocket to receive and position the shoulder of the hook to be set, and means to move said hook-sustaining plate laterally with relation to the longitudinal axis of said plunger.

2. In a hook-setting machine, a plunger, a hook-sustaining plate located at the end thereof and guided thereby and provided at its upper side with a setting-pocket to receive, act against and position the shoulder or that part of the hook at the enlarged end of the shank to which is joined the neck of the hook.

3. In a hook-setting machine, aplunger, a hook-sustaining plate movably mounted in said plunger and having at its upper side a raised portion recessed to receive and position the hook, and having a notch in its end to embrace the neck of said hook.

4. In a hook-setting machine, a stock-support, a punch to punch the stock for the reception of the shank of a hook to be set in the stock, means to move the punch to feed the stock, a clenching-surface, combined with a plunger, a hook-sustaining plate carried thereby, means to move said plunger and plate to set the hook carried by said plate, and means to move said plate at right angles to the longitudinal axis of said plunger after the hook has been set.

5. In a hook-setting machine, a plunger having a laterally-movable hook-sustaining plate provided at its upper end with a setting-pocket to receive and position the hook to be set, a punch having a clenching-surface, means for automatically moving said punch to enter and then to feed the stock into setting position.

6. A plunger, a hook-sustaining plate carried thereby, a delivery-raceway for conducting hooks to said hook-sustaining plate, a device, and means to move it to supply hooks to said delivery-raceway one by one and stop the supply of hooks to said raceway when a hook has been improperly lodged therein.

7. In a hook-setting machine, a stock-support, a punch provided with a clenching-surface, means to move said punch to punch a hole in and to feed the stock over the stock-support, combined with a plunger, a hook-sustaining plate carried thereby and means to change the relative position of said plunger with its hook-sustaining plate and said clenching-surface to set in stock a hook sustained by said plate, and means to move said plate at the end of said plunger and substantially at right angles to the longitudinal axis thereof to withdraw said plate from the throat of a set-hook.

8. In a machine of the class described, a delivery-raceway, a separator having a finger to receive the hooks to be delivered to said raceway, a shaft to which said separator is attached, a stop, a dog adjustably mounted on said shaft to provide for locating the finger of the separator correctly in said raceway, means acting normally to retain one end of said dog against said stop and maintain said separator in position to receive a hook, and means acting on said dog to turn the same and the separator to effect the delivery of a hook.

9. In a machine of the class described, a delivery-raceway, a separator having a finger to receive the hook to be delivered to said raceway, a shaft to which said separator is attached, a stop, a dog adjustably mounted on said shaft to provide for locating the finger of the separator correctly in said raceway, and means acting normally to retain one end of said dog against said stop and maintain said separator in position to receive a hook, a lever, and a spring-pressed pawl pivoted on said lever, said pawl when said lever is moved in one direction meeting said dog and turning said separator to deliver a hook.

10. In a machine of the class described, a delivery-raceway, a separator having a finger to receive a hook to be delivered to said raceway, a shaft to which said separator is attached, a stop, a dog adjustably mounted on said shaft to provide for locating the finger of the separator correctly in said raceway, and means acting normally to retain one end of said dog against said stop and maintain said separator in position to receive a hook, and a lever provided with a spring-pressed pawl that is acted upon by the end of the dog to depress said pawl during the backward movement of said lever after having turned the separator.

11. In a machine of the class described, a main raceway, a delivery-raceway, a separator at the junction of said raceways presenting a finger occupying a normal position to receive from the main raceway and sustain a hook, combined with a lever, and a separator-moving pawl movable with said lever, a spring acting against said pawl, and an adjusting device to determine the extent of movement of said pawl by said spring.

12. In a machine for setting lacing-hooks, a hopper, a rotatable lifter therein for selecting hooks from a mass of hooks, a raceway upon which said rotatable lifter delivers lacing-hooks, means to move said lifter forwardly and to return the same automatically to its starting-point should its forward movement have been obstructed by a lodged hook.

13. In a machine for inserting lacing-hooks, a raceway, a hopper, a series of blades to pick up hooks contained in said hopper, means to bring the blades in register with said raceway and to turn said blades backwardly should the forward movement of a blade be obstructed by a hook lodged between a blade and the raceway.

14 In a machine of the class described, a raceway, a hook-lifter having a ratchet-wheel provided with notches, a toothed p wl-carrier having a pawl to engage the notches of said ratchet-wheel, a rack in engagement with the teeth of said pawl-carrier, a lever, means to move said lever, and a spring connecting said lever with said rack and moving the latter in a direction to turn the hook-lifter in a direction to deliver to said raceway the hooks sustained thereby, said spring being adapted to yield when the movement of the lifter is obstructed to obviate breaking the machine.

15. In a machine of the class described, a raceway, a hook-lifter having a ratchet-wheel provided with notches, a toothed pawl-carrie having a pawl to engage the notches of said ratchet-wheel, a rack in engagement with the teeth of said pawl-carrier, a lever, means to move said lever, a spring connecting said lever with said rack and moving the latter in a direction to turn the hook-lifter in a direction to deliver to said raceway the hooks sustained thereby, and means coacting with said pawl at the end of each forward stroke of the pawl-carrier to release said pawl from the notch of the ratchet-wheel that the pawl-carrier and pawl may be moved backwardly.

16. In a machine of the class described, a raceway, a hook-lifter having a ratchet-wheel provided with notches, a toothed pawl-carrier having a pawl to engage the notches of said ratchet-wheel, a slotted rack in engagement with the teeth of said pawl-carrier, a lever having a pin entering the slot of said rack, a spring connecting said lever with said rack, means to move said lever in one direction that the spring connected therewith may move the rack to turn the hook-lifter to deliver hooks to said raceway, said spring yielding and permitting the rack-bar to stop when the movement of the lifter is obstructed by a hook, the pin of said lever, when the latter is moved in an opposite direction, meeting one end of the slot in said rack-bar and causing the pawl when in engagement with a notch of said ratchet-wheel to turn the same and the lifter backwardly as and for the purpose described.

17. In a machine of the class described, a hopper having a passage for the delivery of hooks, a rotatable hook-lifter, a raceway to which the hook-lifter delivers hooks, a ratchet-wheel fast on the axis of said hook-lifter, a pawl-carrier, a pawl having a lug engaging a notch in said ratchet-wheel, means to release said pawl, and yielding means for actuating said pawl-carrier whereby in case of clogging of the lifter by a hook the pawl will stop short of making its full stroke and will remain in engagement with the notch of the ratchet-wheel during the back stroke of the pawl and pawl-carrier, said pawl moving backwardly with it the ratchet-wheel and the hook-lifter that the obstruction may be removed.

18. In a machine of the class described, a hopper, a hook-lifter, a shaft sustaining the same, a pawl-carrier mounted loosely on said shaft, yielding actuating means for said pawl-carrier, a pawl mounted on said carrier, a ratchet-wheel fixed to said shaft and having notches to be engaged by said pawl, and a device to lift and disengage said pawl from the notches of said wheel only after the pawl-carrier has been moved for its full feeding stroke.

19. In a machine of the class described, a lacing-hook lifter having an attached ratchet-wheel provided with notches, combined with actuating means therefor comprising a pawl and pawl-carrier, a rack connected therewith, a spring connected with said rack, a lever joined with said spring, and means to move said lever said spring permitting the pawl-carrier to be arrested when the lifter is clogged but without stopping said lever.

20. In a machineof the class described, a lifter for lacing-hooks, and a shaft to which said lifter is connected, combined with actuating means therefor comprising a pawl-carrier and pawl, a ratchet-toothed wheel fixed to the shaft carrying the lifter, and yielding means for actuating said pawl-carrier and pawl that their movement may be arrested whenever the lifter is clogged by a hook, said pawl at such times retaining its engagement with the ratchet-wheel, and turning said lifter backwardly that the lacing-hook which clogged the lifter may be removed therefrom.

21. In a machine of the class described, a punch and set, means to move the same laterally to feed the stock, combined with a top end gage movable longitudinally therewith during the feeding operation.

22. In a machine of the class described, a punch and set, and means to move the same laterally to feed the stock combined with a top end gage adjustable with relation to said punch and set and movable longitudinally therewith in the operation of feeding the stock.

23. In a machine of the class described, a punch and set, a slide carrying said punch and set, means to move the punch in the slide, means to move the slide while the punch is in the stock that the latter may feed the stock, and two end gages carried by and movable with said slide as the punch is moved to feed the stock.

24 In a hook-setting machine, stock-feeding means and connected end gages movable therewith and determining the position of the stock prior to the engagement of the stock by the stock-feeding means.

25. In a hook-setting machine, a stock-support, a punch-bar having a punch for feeding the stock, a slide sustaining a punch-bar, means to move the punch-bar to enter the stock to feed the same, means to move the slide horizontally that the punch may feed the stock, and an end gage movable with the slide and punch as the latter feeds the stock.

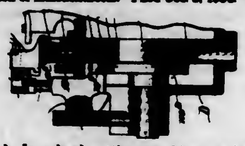
26. In a hook-setting machine, a stock-support, a punch, means to move the same vertically and horizontally, and two end gages movable horizontally with said punch and determining the position of the shoe-upper on the stock-support prior to the action of the punch in feeding the stock.

27. In a machine for setting lacing-hooks, stock-feeding means including a sliding frame, an end gage movable longitudinally with said frame during the feeding of the stock, and devices to adjust the feeding stroke of the stock-feeding means and gage to the size number of the shoe, that the bottom and top hooks of a series of hooks may be properly set irrespective of the length or size of the shoe.

28. In a hook-setting machine, a stock-support, a clamping-foot, means to move it to clamp and release the stock, a punch, a carrying-slide therefor, means to acuate the punch in said slide to punch a hole in the stock while the latter is clamped on the stock-support, means to move said slide and punch laterally while the stock is unclamped that the punch may move the stock over the work-support, a plunger having means to sustain the hook to be set, actuating means for said plunger, and an end gage carried by said slide, to operate substantially as described.

29. In a hook-setting machine, a stock-support, a clamping-foot, means to move it to clamp and release the stock, a punch, a carrying-slide therefor, means to actuate the punch in said slide to punch a hole in the stock while the latter is clamped on the stock-support, means to move said slide and punch laterally while the stock is unclamped that the punch may move the stock over the work-support, a plunger having means to sustain the hook to be set, actuating means for said plunger, and two end gages carried by said slide, one being adjustable with relation to the other and operating substantially as described.

811,840. HOOK-SETTING MACHINE. PERLEY R. GLASS, Quincy, Mass., assignor to The Peerless Machinery Company, Boston, Mass., a Corporation of Massachusetts. Filed Oct. 3, 1904. Serial No. 226,936.



Claim.—1. In a hook-setting machine, a plunger-carrier and plunger, combined with a movable hook-sustaining plate having a slot at its end, the wall of which helps to secure the head of the hook while the hook is being set.

2. In a hook-setting machine, a plunger-carrier and plunger, combined with a movable hook-sustaining plate having a slot at its end, the wall of which helps to support the head of the hook while the hook is being set, said plate having a notch at right angles to said slot to receive the neck of the hook.

3. In a hook-setting machine, a plunger, a hook-sustaining plate sustained loosely by said plunger, a stationary stripper carried by said plunger and normally out of engagement with the head of the hook and means to withdraw said plate from the throat of said hook, said stripper engaging the edge of the top of the hook as the plate is withdrawn from the throat thereof thus insuring the discharge of the hook from said plate.

4. In a machine of the class described, a plunger having a head grooved for the reception of a hook-sustaining plate, a hook-sustaining plate guided by the head of said plunger, a stripper sustained by said head and occupying a position always between the opposite ends of said plate, means to move said plate transversely of the longitudinal axis of the plunger to withdraw the end of the plate from the throat of the stud, said stripper insuring the discharge of the hook from the hook-sustaining plate.

5. In a hook-setting machine, a hook-delivery raceway, a plunger-carrier and plunger, means to adjust one of said parts with relation to the other part to provide for varying thicknesses of stock, a hook-sustaining plate slidably sustained at the end of said plunger, means to move said plunger vertically for a defined distance whatever the thickness of the stock, and an adjustable stop to arrest the upper part of the plunger in its descent that the hook-sustaining plate may be stopped in exact alinement with said hook-delivery raceway.

6. In a hook-setting machine, a plunger-carrier, a plunger loosely mounted therein and provided with a hook-sustaining plate, a raceway to deliver hooks to the hook-sustaining plate, and an adjustable stop to arrest the plunger in its descent and stop the end of the hook-sustaining plate exactly in line with said raceway.

7. In a hook-setting machine, a plunger-carrier, a plunger loosely mounted therein and a spring interposed between said plunger and plunger-carrier, a hook-sustaining plate mounted in said plunger, a raceway to deliver hooks to said plate, and an adjustable stop to arrest the plunger in its descent to stop the end of the hook-sustaining plate exactly in line with said raceway, said spring permitting the plunger-carrier to descend to its starting-point without moving the plunger.

8. In a hook-setting machine, a plunger, a hook-sustaining plate carried thereby and having a block joined thereto, combined with a lever having an extension engaging said block loosely, and means to move said lever.

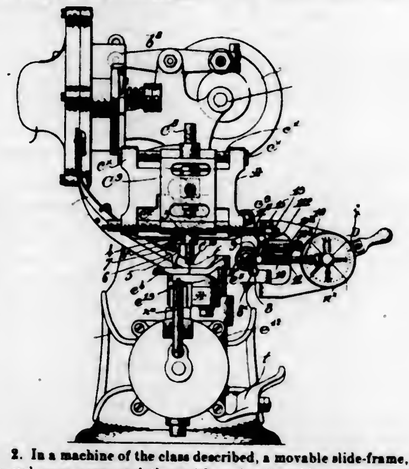
9. In a hook-setting machine, a plunger, a hook-sustaining plate carried thereby, a sleeve, a screw connecting said plate and sleeve, and a lever engaged loosely by said sleeve, and means to move said lever.

10. In a hook-setting machine, the combination with the plunger having a hook-sustaining plate to receive and carry a hook to be set, a work-support having a wear-plate the face of which acts as guide for the side of the hook as the latter is being moved during the setting operation.

11. In a hook-setting machine, a work-plate having a wear-plate provided with a vertical face to act against one side of the hook being set, and a seating device to enter the groove in the neck of the hook, as and for the purpose set forth.

811,841. HOOK-SETTING MACHINE. PERLEY R. GLASS, Quincy, Mass., assignor to The Peerless Machinery Company, Boston, Mass., a Corporation of Massachusetts. Filed Oct. 13, 1904. Serial No. 228,008.

Claim.—1. In a machine of the class described, a punch and set, means to cause the punch to enter and feed the shoe-upper, a top end gage movable with said punch during its feeding operation, and another top end gage sustained independently of said punch and made adjustable with relation to said first gage according to the size of the shoe being provided with hooks.



2. In a machine of the class described, a movable slide-frame, a top end gage connected therewith and adjustable longitudinally thereon, a punch carried by said frame, means to move the punch to enter the material, and means to move the frame to feed the material, combined with a second longitudinally-adjustable top end gage sustained by the framework of the machine and occupying a stationary position with relation to the top end gage sustained by said slide-frame, a finger movable with said second top end gage in its adjustment, and an indicator coacting with finger.

3. In a machine of the class described, a slide-frame, a combined punch and set carried thereby, means to move said slide-frame to and fro, means to cause the punch to enter the stock and feed the latter as the slide-frame is moved in one direction, a top end gage connected with said slide-frame and movable therewith in its to-and-fro movements.

4. In a machine of the class described, a stock-support, a slide-frame provided with a set and punch, a top end gage fixed to and movable only longitudinally with said head, and another adjustable top end gage separated from said frame.

5. In a machine of the class described, a stock-support, a slide-frame provided with a set and punch, a top end gage fixed to and movable only longitudinally with said frame, and another adjustable top end gage sustained independently of said frame, combined with a edge gage intermediate said top end gages.

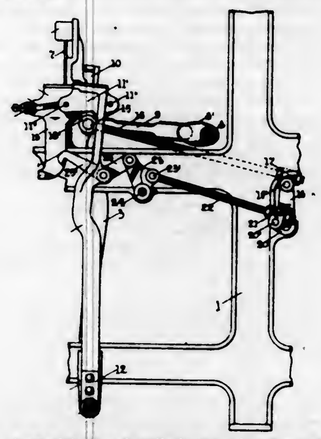
6. In a machine of the class described, a slide-frame having a boss at its lower end, a punch located in said boss, a collar surrounding said boss, and a top end gage adjustable laterally on said collar.

811,842. LOOM FOR MAKING PILE FABRICS. ALBERT A. GORDON, Jr., Worcester, Mass., assignor to Crompton & Knowles Loom Works, a Corporation of Massachusetts. Filed Dec. 9, 1904. Serial No. 236,084.

Claim.—1. In a loom of the class described, the combination with the lay, and a pivotally-supported and swinging frame at the end of the lay, carrying a shuttle-box, of connections intermediate the lay and the swinging frame, one of said connections having a locking-arm thereon to engage a part of the lay and lock the swinging frame and lay together, during a portion of their movement.

2. In a loom of the class described, the combination with the lay, and a pivotally-supported and swinging frame at the end of the lay, carrying a shuttle-box, of connections intermediate the lay and the swinging frame, and a locking device carried on the swinging frame, and adapted to engage a part of the lay, to lock the swinging frame and lay together, during a portion of their movement, said locking device connected with and operated by the connections intermediate the lay and the swinging frame.

3. In a loom of the class described, the combination with the lay, and a pivotally-supported and swinging frame at the end of the lay carrying a shuttle-box, of connections intermediate the lay and the swinging frame, and a locking device to lock the swinging frame and lay together, during a portion of their movement, and an adjusting-screw, adapted to maintain the proper relative positions of the swinging frame and lay.



4. In a loom of the class described, the combination with the lay, and a pivotally-supported and swinging frame at the end of the lay, carrying a shuttle-box, of connections intermediate the lay and the swinging frame, and a locking device, connected with and operated by said connections, to lock said frame to the lay during a portion of their movement, and an adjusting-screw carried on the lay, and adapted to engage the swinging frame when the same is locked to the lay.

5. In a loom of the class described, the combination with the lay, and a pivotally-supported and swinging frame at the end of the lay, carrying a shuttle-box, of connections intermediate the lay and the swinging frame, said connections comprising a connector from the lay to an arm on a rock-shaft, and said rock-shaft, a second arm on said rock-shaft, a connector from said arm to a lever or arm fast on a lever, and rock-shaft, and said rock-shaft, and a connection from said lever or arm to the swinging frame, the relative position of the parts being such, that the movement of the swinging frame relatively to the lay is accelerated at certain times.

811,843. DAMPENER FOR SHEET FEEDS OR SEPARATORS. CHARLES G. HARRIS, Niles, Ohio, assignor to The Harris Automatic Press Company, Niles, Ohio, a Corporation of Ohio. Filed Feb. 24, 1905. Serial No. 247,130.

Claim.—1. A moistening device for paper feeding or pushing elements, comprising an imperforate fluid-containing body from which the fluid will gradually seep to the outer surface sufficient to moisten a paper-engaging element.

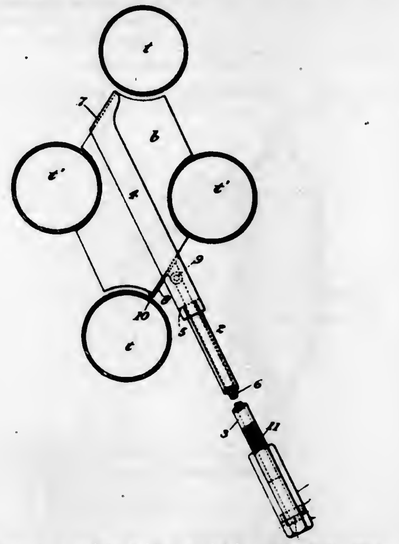
2. A moistening device for paper feeding or pushing elements, comprising an imperforate fluid-containing body from which the fluid will seep to the outer surface in quantity not exceeding that which may be taken up by evaporation.

3. A moistening device for paper feeding or pushing elements, comprising a fluid-containing body of such density of composition that the fluid will gradually seep to the outer surface thereof, and means for sealing such body as against the admission of air.

4. A moistening device for paper-feeding bands or rollers comprising a fluid-containing body of diatomaceous earth from which the fluid will be caused to seep to the outer surface in quantity not exceeding that which may be taken up by evaporation or by a paper-engaging element contacting therewith.

5. A moistening device for paper-feeding bands or rollers comprising a fluid-containing body of diatomaceous earth from which the fluid will be caused to seep to the outer surface in quantity not exceeding that which may be taken up by evaporation or by a paper-engaging element contacting therewith, and means for controlling the admission of air to such body to increase the flow therefrom.

811,844. TOOL FOR HOLDING FIRE-BRICKS OF WATER-TUBE BOILERS. PATRICK HEELY and JOHN KEMM, Brooklyn, N. Y. Filed July 7, 1905. Serial No. 268,734.



Claim.—1. A tool for holding fire-bricks at diagonally opposite corners of the bricks and for inserting said bricks in or removing them from water-tube boilers, embodying a rod-like carrier, and means on said carrier for clamping and releasing a fire-brick at diagonally opposite corners thereof.

2. A tool for holding and inserting or removing the fire-bricks of water-tube boilers, embodying a rod-like carrier, a pair of clamps projecting respectively from and engaging a brick at opposite sides of the longitudinal axis of said carrier, and means for adjusting one of said clamps relatively to the other.

3. A tool for holding and inserting or removing the fire-bricks of water-tube boilers, embodying a rod-like carrier, a pair of clamps projecting respectively from and engaging a brick at opposite sides of the longitudinal axis of said carrier at obtuse angles thereto, and means for adjusting one of said clamps relatively to the other.

4. A tool for holding and inserting or removing the fire-bricks of water-tube boilers, embodying a rod-like carrier, a pair of clamps projecting respectively from and engaging a brick at opposite sides of the longitudinal axis of said carrier each clamp being with respect to the carrier substantially at a right angle in the line of its height and at an obtuse angle in the line of its base.

5. A tool for holding and inserting or removing the fire-bricks of water-tube boilers, embodying a rod-like carrier, a pair of clamps projecting respectively from and engaging a brick at opposite sides of the longitudinal axis of said carrier one of said clamps being movable lengthwise of said carrier and also mounted to swing on said carrier to change its angular position.

6. A tool for holding and inserting or removing the fire-bricks of water-tube boilers, embodying a rod-like carrier, a pair of clamps projecting respectively from and engaging a brick at opposite sides of the longitudinal axis of said carrier one of said clamps having an angular brick-supporting lip, and means for adjusting one of said clamps relatively to the other.

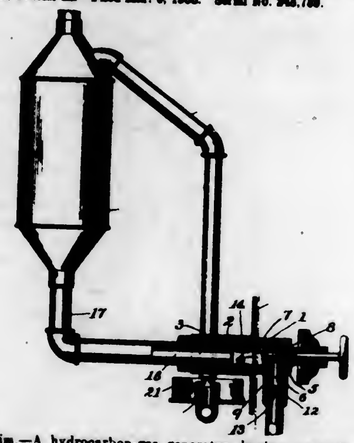
7. A tool for holding and inserting or removing the fire-bricks of water-tube boilers, embodying a two-part rod-like carrier, a pair of clamps projecting respectively from and engaging a brick at opposite sides of the longitudinal axis of the two parts of said carrier, and means for moving one part of the carrier relatively to the other.

8. A tool for holding and inserting or removing the fire-bricks of water-tube boilers, embodying a two-part rod-like carrier the two parts of which are connected by screw-threads and are adjustable thereby relatively to each other, and a pair of clamps projecting respectively from and engaging a brick at opposite sides of the longitudinal axis of the two parts of said carrier.

9. A tool for holding fire-bricks at diagonally opposite corners of the bricks and for inserting said bricks in or removing them from

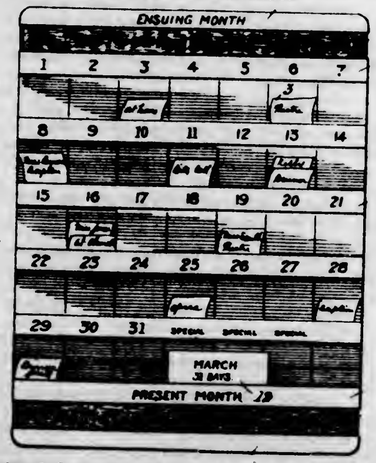
water-tube boilers, embodying a two-part rod-like carrier one part of which constitutes a guide and the other part a slide movable along said guide, a pair of clamps projecting respectively from said guide and slide for clamping and releasing a fire-brick at diagonally opposite corners thereof, and means for adjusting the slide along said guide and for holding the same in its adjusted position.

811,845. HYDROCARBON-GAS GENERATOR. LEO HENDERSON, Peoria, Ill. Filed Mar. 6, 1905. Serial No. 248,780.



Claim.—A hydrocarbon-gas generator, having a supply-duct for connection with a source of liquid hydrocarbon, provided with a small valve-controlled orifice arranged to emit the said liquid hydrocarbon in the form of a jet, a superheating-chamber arranged in line with said orifice to receive said jet of hydrocarbon, a gas-pipe connected to said chamber, a subburner for heating said chamber, means to supply said burner with gas generated in said chamber, a commingling-passage between said chamber and said jet-orifice, said commingling-passage being open to the atmosphere, a movable sleeve surrounding said passage to vary the size of the opening of said passage to the atmosphere, and a flame-shield carried by said sleeve between said subburner and said jet.

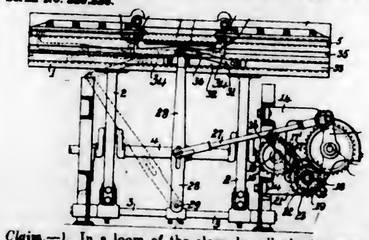
811,846. PERPETUAL CALENDAR. CHARLES P. HIDDEN, Baltimore, Md. Filed Mar. 1, 1905. Serial No. 247,231.



Claim.—1. In a perpetual calendar, the combination of a book carrying a series of strips which are inscribed with the days of the month and secured at the lower edge only to the back, and extending entirely across the book from side to side thereby producing continuous pockets for memorandum-cards, and an endless band on which is inscribed the days of the week, and the said band being placed loosely over and around the back and adapted to be moved laterally in either direction independently of the back to adjust the days of the week to the days of the month, substantially as specified.

2. In a perpetual calendar, the back thereof having the days of the month fixed thereon in horizontal rows, and arranged to be read from left to right, combined with two independent horizontally-placed and movable endless bands inscribed with the days of the week, in duplicate, one set of inscriptions forming the continuation of the other, and one band being arranged over the rows of figures indicating the days of the month, and the other similar band, being situated below the said rows of figures, substantially as and for the purpose specified.

811,847. LOOM FOR WIRE FABRICS OR GAUZE. EDWARD HOLLINGWORTH, Debdens, England, assignor to Crompton & Knowles Loom Works, a Corporation of Massachusetts. Filed Oct. 20, 1904. Serial No. 229,236.



Claim.—1. In a loom of the class described, the combination with a continuously-driven gear or pinion, and an oscillating lever, and connections from said lever to a shuttle, for traversing the shuttle across the loom, of mechanism intermediate said continuously-driven gear or pinion, and said oscillating lever, to cause said lever to dwell at each extremity of its movement, said mechanism consisting of a gear having a stud or roll thereon entering a longitudinal slot in an arm or lever, and said lever loosely mounted on a shaft, and having loosely mounted on one end a bevel-gear which meshes with a bevel-gear mounted loosely on a shaft, and said bevel-gear having peripheral teeth thereon meshing with a pinion on a continuously-driven rotary shaft, and said shaft, a second bevel-gear loosely mounted and in mesh with the bevel-gear on said lever, and having peripheral teeth thereon which mesh with a gear, and said gear, and a crank connected therewith, and a connection from said crank to the oscillating lever.

2. In a loom of the class described, a lever centrally pivoted on a block or slide and adapted to be moved endwise to and fro across the lay, said lever having upturned fingers or projections adapted to enter corresponding recesses or grooves in the respective ends of the shuttles, a cam groove or slide in the lay, which is engaged by a stud or roll on said lever, to move said lever as it is carried across the lay, to cause one finger on said lever to be engaged with and the other to be disengaged from the shuttle, alternately, connections intermediate said slide and an oscillating lever, and said oscillating lever, and means for giving a dwell thereto at each extremity of its movement, said means consisting of a continuously-driven gear or pinion, a gear having a stud or roll thereon entering a longitudinal slot in an armor or lever, and said lever loosely mounted on a shaft, and having loosely mounted on one end a bevel-gear, which meshes with a bevel-gear mounted loosely on a shaft, and said bevel-gear, having peripheral teeth thereon meshing with a pinion on a continuously-driven rotary shaft, and said shaft, a second bevel-gear loosely mounted, and in mesh with the bevel-gear on said lever, and having peripheral teeth thereon which mesh with a gear, and said gear, and a crank connected therewith, and a connection from said crank to the oscillating lever.

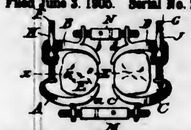
811,848. DENTAL CLAMP. EDSON L. HUTCHINSON, Honolulu, Hawaii. Filed Apr. 5, 1905. Serial No. 253,904.

Claim.—1. In a dental clamp of the kind described, a U-shaped body portion having one leg bifurcated and the other terminating in a clamping-jaw, and a lever pivoted between the ends of the bifurcation and coöperating with said clamping-jaw.

2. In a dental clamp of the kind described, a lever pivoted to one end of the clamp and capable of sliding laterally upon said pivot.

3. A dental clamp comprising a body *a*, a jaw *b*, legs *c c'* connected by a bar *d*, and a lever *g* provided with a jaw *h* and capable of turning upon the bar *d* and of sliding upon same between the ends of the legs *c c'*.

811,849. TEETH-SEPARATOR. EDSON L. HUTCHINSON, Honolulu, Hawaii. Filed June 3, 1905. Serial No. 263,616.



Claim.—1. In an apparatus for separating teeth, two bows, adjustable connections between the bows, each bow composed of two sections, each section provided with a separating-jaw, one section of each bow provided with a bar adapted to slide in the end of the other section, and means for instantly clamping and releasing the sections, substantially as described.

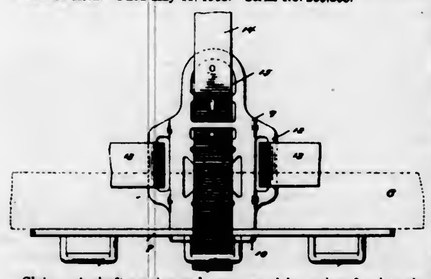
2. In an apparatus for separating teeth, two bows, adjustably connected by right and left handed screws, each bow composed of two sections, each section provided with a separating-jaw, one section of each bow provided with a bar adapted to slide in the end of the other section, and means for instantly clamping and releasing the sections, substantially as described.

3. In an apparatus for separating teeth, the combination of the sectional bows A C provided with the jaws *a c* and the bars F G respectively, the sectional bows B D provided with the jaws *b d* and bifurcated ends in which the bars F G respectively are adapted to slide, and means for clamping said bars in various positions in said bifurcated ends.

4. In an apparatus for separating teeth, a sectional bow provided with a bar having a threaded hole to engage a screw P, and a piece Q swiveled on the end of said screw, for the purpose described.

5. In combination, the sectional bows A C, connected by the screw-bar M, and provided with jaws *a c*, bars F G, screws P with pieces Q, and the sectional bows B D, connected by the screw-bar N, and provided with the jaws *b d* and bifurcated ends in which are respectively pivoted the cam-levers H J and shoes K L, for the purpose and substantially as described.

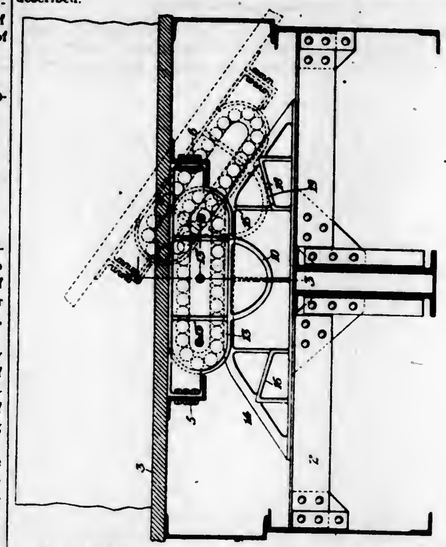
811,850. SHAFT CARRIER AND TUG. WILLIAM M. JOHNSON, Detroit, Mich. Filed May 11, 1905. Serial No. 260,005.



Claim.—A shaft carrier and tug comprising a bar fixed to the under side of the shaft and having a series of loops depending therefrom, and a plate to which the tug is attached, having its lower end curved under the shaft and provided with an opening through which one of said loops extends, and having at its upper end a buckle to attach the back-strap which is extended down outside the shaft and inserted through the loop under the said opening.

811,851. LATERALLY-MOVABLE DUMPING-VEHICLE. JOHN W. KING, New York, N. Y., assignor to Lawson Boat and Car Company, New York, N. Y., a Corporation of New Jersey. Filed May 17, 1905. Serial No. 260,941.

Claim.—1. In a vehicle, the combination with the underframe having a track and lateral bearings, of the laterally-movable box provided with antifriction means engaging said track and downwardly-extending projections adapted to engage and rock on said bearings while the box is completing its lateral movement and thereby imparting simultaneous rotary movement thereto, substantially as described.



2. In a vehicle, the combination with the underframe having a track and lateral inclined bearings, of the laterally-movable box provided with antifriction means engaging said track and downwardly-extending projections adapted to engage and rock on said bearings while the box is completing its lateral movement and thereby imparting simultaneous rotary movement thereto, substantially as described.

3. In a vehicle, the combination with the underframe having a track and lateral bearings, of the laterally-movable box provided with downwardly-extending rounded projections adapted to engage and rock on said bearings while the box is completing its lateral movement thereby imparting simultaneous rotary movement thereto, substantially as described.

4. In a vehicle, the combination with the underframe having a track and inclined lateral bearings, of the laterally-movable box provided with antifriction means engaging said track and downwardly-extending rounded projections adapted to engage and rock on said bearings while the box is completing its lateral movement thereby imparting simultaneous rotary movement thereto, substantially as described.

5. In a vehicle, the combination with the underframe having a track and lateral bearings, of the laterally-movable box provided with antifriction means engaging said track and downwardly-extending rounded projections adapted to engage and rock on said bearings while the box is completing its lateral movements thereby imparting simultaneous rotary movement thereto, substantially as described.

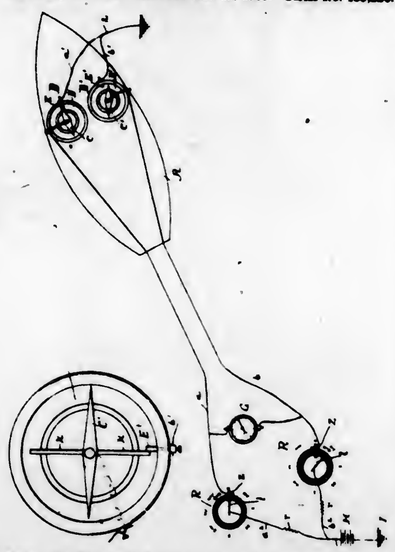
6. In a vehicle, the combination with the underframe having a track and lateral bearings, of the laterally-movable box provided with a raceway, antifriction devices therein engaging said track and downwardly-extending projections adapted to engage and rock on said bearings while the box is completing its lateral movement thereby imparting simultaneous rotary movement thereto, substantially as described.

7. In a vehicle, the combination with the underframe having a track and lateral inclined bearings, of the laterally-movable box provided with a raceway, antifriction devices therein engaging said tracks and downwardly-extending rounded projections adapted to engage and rock on said bearings while the box is completing its lateral movement, thereby imparting simultaneous rotary movement thereto, substantially as described.

8. In a vehicle, the combination with the laterally-movable box provided with downwardly-extending projections and a raceway having a continuous passage open at the bottom, antifriction devices therein, of the underframe having a track projecting through the

opening in the raceway into engagement with said antifriction devices and lateral bearings engaged by said projections while the box is completing its lateral movement thereby imparting simultaneous rotary movement to said box, substantially as described.

811,852. METHOD OF ASCERTAINING THE COMPASS DIRECTION OF MOVING OBJECTS. ISIDOR KITSEE, Philadelphia, Pa. Filed May 18, 1901. Renewed Jan. 15, 1906. Serial No. 130,296.



Claim.—1. The method of ascertaining the compass direction of moving objects, which consists in passing a current of electricity through a movable member of a compass, and a resistance which changes the flow of the current in accordance with the direction of the moving object, causing an indicator to vary in accordance with the current-flow, and indicating the compass direction of the moving object by a variable resistance through the medium of which latter said indicator is restored to equilibrium.

2. The method of ascertaining the compass direction of moving objects, which consists in passing a current of electricity through a movable member of a compass and a Wheatstone bridge, disturbing the balance of said bridge by the varying position of said movable compass member, and restoring the balance of the bridge by a variable resistance adapted to indicate, through the degree of resistance necessary for the restoration of the balance of said bridge, the compass direction of the moving object.

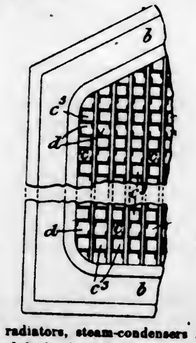
3. The method of ascertaining the compass direction of moving objects, which consists in passing a current of electricity through a movable member of a compass and a Wheatstone bridge, disturbing the balance of said bridge by the varying position of said movable compass member, indicating the disturbed condition of said balance in accordance with the varying position of the movable compass member, and restoring the balance of the bridge by a variable resistance adapted to indicate, through the degree of resistance necessary for the restoration of the balance of said bridge, the compass direction of the moving object.

4. The method of ascertaining the compass direction of moving objects, which consists in passing a current of electricity through a movable member of a compass and a Wheatstone bridge, disturbing the balance of said bridge by increasing the resistance of one arm thereof through the varying position of the movable member of the compass, and restoring the balance of said bridge by decreasing the resistance of said arm until such resistance is equal to that of the second arm of the bridge, the value of the resistance removed from the first-mentioned arm being adapted to indicate the compass direction of the moving object.

5. The method of ascertaining the compass direction of moving objects, which consists in passing a current of electricity through a movable member of a compass and a Wheatstone bridge, disturbing the balance of said bridge by increasing the resistance of one arm thereof through the varying position of the movable member of the compass, indicating the degree of increased resistance, and restoring the balance of said bridge by decreasing the resistance of said arm until such resistance is equal to that of the second arm of the bridge, the value of the resistance removed from the first-mentioned arm being adapted to indicate the compass direction of the moving object.

6. The method of ascertaining the compass direction of moving objects, which consists in passing a current of electricity through a movable member of a compass and a Wheatstone bridge, disturbing the balance of said bridge by increasing the resistance of one arm thereof through the varying position of the movable member of the compass, and restoring the balance of said bridge through the medium of a variable resistance by means of which the resistance in said arm is equalized with the resistance in a second arm of the bridge, said variable resistance being adapted to indicate the compass direction of the moving object.

811,853. RADIATOR, STEAM-CONDENSER, AND THE LIKE. FREDERICK LANFLOUGH, Willesden, England. Filed Apr. 26, 1905. Serial No. 257,470.

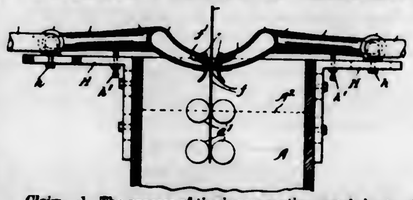


Claim.—1. In radiators, steam-condensers and the like, the combination of a tank-body, flat tubes communicating between the upper and lower portions of said body, trough-shaped gills or radiating surfaces formed of sheet metal, apertures in said gills or radiating surfaces and outwardly-extending flanges by which the gills or radiating surfaces are soldered between the tubes substantially as set forth.

2. In a radiator, steam-condenser and the like the combination of a tank-body, flat tubes communicating between the upper and lower portions of said tank-body and headers or filling-in pieces placed between the flat tubes at top and bottom thereof to form continuous plain surfaces to which the upper and lower parts of the tank can be readily soldered substantially as set forth.

3. In a radiator, steam-condenser and the like the combination of a filling-cap provided with spring-bolts, and a filling tube or nozzle having a notched inwardly-projecting rim under which the spring-bolts are pressed thus securing the filling-cap normally in position but allowing it to be raised by undue pressure and thereby give vent to the steam through the notches in the rim and so prevent injury to the radiator substantially as herein set forth.

811,854. PROCESS OF TINNING OR COATING METAL SHEETS WITH TIN OR OTHER METALLIC COATINGS. JOHN LEE, Philadelphia, Pa. Filed Aug. 18, 1903. Serial No. 169,930.



Claim.—1. The process of tinning or coating metal sheets with metallic coatings, consisting in passing or conveying the metal sheets to be coated through the molten coating metal and the oil or flux thereon, and subjecting the sheets as they pass with their lower edges horizontal up out of the coating metal and the oil or flux thereon, to superheated compressed air projected in a wide blast approximately the width of the sheet against the surfaces of the sheet while the tin or metal coating thereon is yet fluid, whereby the tinning operation is facilitated, the thickness of the tin coating regulated and made uniform; surplus tin removed; selvage edges at the bottom edges of the sheets prevented, and the surface of the sheet cleaned from grease, oil or flux substantially as specified.

2. The process of tinning, consisting in passing with their lower edges horizontal sheets to be tinned up through molten tin and the oil or flux thereon and projecting superheated compressed air in a wide blast approximately the width of the sheet against the surfaces of the sheet as they issue upwardly from the tinning-pot, and while the tin coating thereon is yet fluid, substantially as specified.

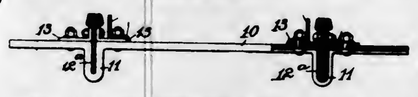
3. The process of coating metal sheets with a metallic coating consisting in passing the sheet with its lower edge horizontal upwardly through molten metal and the oil or flux thereon, and projecting heated compressed fluid in a wide blast approximately the width of the sheet against the surfaces of the sheet, as it issues upwardly from the molten metal and the oil or flux thereon, whereby the tinning operation is facilitated; the thickness of the tin coating regulated and made uniform; surplus tin removed; selvage edges at the bottom edges of the sheets prevented, and the surface of the sheet cleaned from grease, oil or flux substantially as specified.

4. The process of tinning metal sheets consisting in passing the sheet with its lower edge horizontal upwardly through molten tin and the oil or flux thereon and between wide blasts of heated fluid projected downwardly against the sheet as it issues from the molten tin and the oil or flux thereon, substantially as specified.

5. The process of coating metal sheets with metallic coating, consisting in passing the sheet with its lower edge horizontal upwardly through the molten coating metal and the oil or flux thereon between wide blasts of heated air projected downwardly against the surfaces of the sheet, whereby the tinning operation is facilitated; the thickness of the tin coating regulated and made uniform; surplus tin removed; selvage edges at the bottom edges of the sheets prevented, and the surface of the sheet cleaned from grease, oil or flux substantially as specified.

6. The process of tinning metal sheets consisting in passing a sheet with its lower edge horizontal upwardly through molten tin and the oil or flux thereon between wide blasts of hot air as it issues from a tinning-pot, and while the tin coating thereon is yet molten, substantially as specified.

811,855. RAILROAD. GEORGE A. LE FEVRE, Orangeburg, N. Y. Filed Mar. 11, 1905. Serial No. 249,563.



Claim.—1. A railroad comprising rails made plain and without flanges between the head and bottom portions, and a relatively flat sleeper having depending seats to receive the rails, the said seats forming transverse wings or flanges of substantially the width of the flat part of the sleeper which extend below the general level of the sleeper.

2. The combination of the flangeless rail and the relatively flat sleeper having a seat therein to receive the rail, the seat being formed by bending down the sleeper, thus making a transverse wing of substantially the width of the flat part of the sleeper extending well below the general bottom portion of the sleeper.

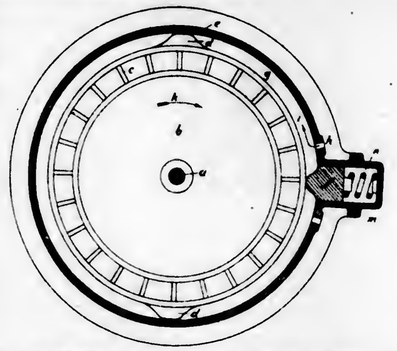
3. A railroad, comprising a cross-sleeper having depending seats, rails without base-flanges, the said rails having their webs held in the seats of the sleeper, and an angle guard-rail secured to the sleeper.

811,856. REVERSING-BRAKE FOR TURBINE-ENGINES. HUGO LENTZ, Berlin, Germany. Filed June 26, 1905. Serial No. 267,093.

Claim.—1. In combination, a turbine-wheel, a casing therefor provided with an annular chamber, a projection on the wheel and moving through said chamber, and means for interposing elastic resisting medium in the chamber to the travel of the projection.

2. In combination, a turbine-wheel, a casing therefor, an annular chamber between said parts, a projection carried by said wheel, and means for interposing elastic resisting medium in the chamber to the travel of the projection.

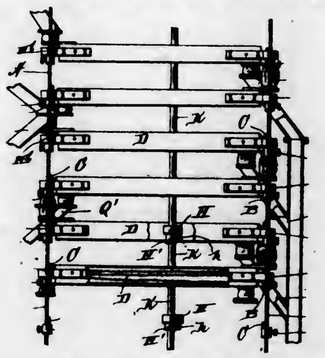
3. In combination, a turbine-wheel, a casing therefor, an annular chamber between said parts, a projection carried by said wheel, and means for supplying steam to said chamber to interpose a yielding resistance to the travel of the projection.



4. In combination, a turbine-wheel, a casing therefor, an annular chamber between said parts, a projection carried by said wheel and moving through the chamber, a movable projection carried by the casing and entering the chamber, and means for interposing elastic resisting medium between the two projections.

5. In a reversing-brake device for turbines, a rotary piston, a projection driven by said piston, and means for interposing elastic resistance medium in the path of said projection.

811,857. HANGER FOR SIFTERS AND SCREENS. JOSEPH T. LEONARD, Sedalia, Mo. Filed May 10, 1905. Serial No. 259,799.



Claim.—1. An improved hanger for bolting-screens comprising, in combination with a screen and fixed upright shafts, spiral springs fastened to said screen and having each an end closely coiled to form a socket, adjustable collars mounted upon said shafts and pins carried by said collars and engaged by said coils, and means for imparting a gyrating motion to the screen, as set forth.

2. An improved hanger for bolting-screens comprising, in combination with a screen and fixed upright shafts, coil-springs fastened to said screen and having each an end closely coiled to form a socket, collars mounted upon said shafts, a pin carried by each collar, a set-screw for holding said collar in adjusted positions, said pins adapted to engage said coils at the end of said springs, an eccentric mounted in suitable bearings in the screen, a shaft to which said eccentric is fixed whereby a gyrating motion may be imparted to the screen mounted upon the springs which are upon edge, as set forth.

811,858. MEANS FOR LUBRICATING WHEELS. GEORGE W. LOVEJOY, Tehachapi, Cal., assignor of one-half to Leo Harris, Tehachapi, Cal. Filed May 6, 1905. Serial No. 259,214.

Claim.—1. The combination of a wheel, an axle-box secured to the wheel and closed at one end, and an axle provided with a tubular spindle open at the outer end and having an intermediate lateral outlet and provided at its inner portion with an oil hole or passage, said

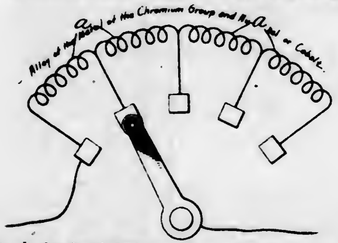
spindle being arranged within the axle-box and having its open end fitted against the inner face of the closed end of the axle-box for retaining a lubricant within the spindle.

2. The combination of a wheel, an axle-box closed at one end and having its other end threaded, an axle having a tubular spindle fitted within the axle-box and open at one end, said spindle provided with an intermediate outlet and having its open end fitted against the closed end of the axle-box, a packing arranged at the open end of the axle-box, and an adjustable gland or nut engaging the threaded end of the axle-box and the packing.

3. The combination of a wheel having an axle-box closed at one end and threaded at the other, an axle having a hollow spindle open at one end and provided with an intermediate lateral outlet, said axle being also provided with a shank having a longitudinal oil hole or passage communicating with the hollow spindle, an adjustable gland or nut engaging the threaded end of the axle-box and having a tapered opening and provided with an interior shoulder, and a packing arranged within the tapered opening of the gland or nut and interposed between the latter and the axle.

4. The combination of a standard having its lower portion bent at an angle, an inclined wheel having an axle-box closed at one end, an inclined axle secured to the lower end of the standard and provided with a tubular spindle open at one end and provided with an intermediate outlet, the open end of the spindle being fitted against the closed end of the axle-box, and means located at the open end of the axle-box for securing the axle therein.

811,859. ELECTRIC RESISTANCE ELEMENT. ALBERT L. MARSH, Lake Bluff, Ill., assignor to The Hoskins Company, Chicago, Ill., a Corporation of Illinois. Filed Mar. 15, 1905. Serial No. 250,309.



Claim.—1. An electric resistance element composed of a metal alloy consisting of one of the metals of the chromium group, in the proportion of less than fifty per cent. of the element, and more than fifty per cent. of metal having the properties of nickel and cobalt.

2. An electric resistance element comprising a strip, strand or filament formed of an alloy of nickel and one of the metals of the chromium group.

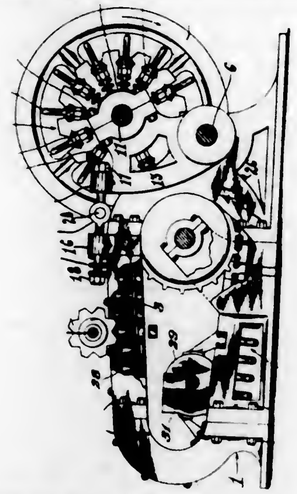
3. An electric resistance element comprising an annealed strip, strand or filament formed of an alloy of nickel and one of the metals of the chromium group.

4. An electric resistance element formed of a metal alloy consisting of nickel and chromium.

5. An electric resistance element formed of a metal alloy consisting of chromium in the proportion of less than fifty per cent. of the element and nickel in the proportion of more than fifty per cent. of the element.

811,860. BRIQUETING-PRESS. HOWARD E. MARSH, Palms, Cal., assignor of one-half to William P. Wagy, Los Angeles, Cal. Filed June 27, 1905. Serial No. 267,108.

Claim.—1. A briquet-press provided with a series of disconnected molding-boxes, an endless guide for said boxes, reciprocating compressing means for said boxes, and means constructed to operate said reciprocating compressing means to compress the charge in said boxes and for simultaneously moving said reciprocating means and their boxes through their orbit.



2. A frame provided with an endless guide, a series of molds adapted to move along said guide, compressing means for moving said molds along said guide and for compressing material in said molds, and means for discharging material therefrom.

3. A frame provided with an endless guide extending in a vertical plane, a series of contacting molds adapted to move along said guide, and compressing means engaging the ascending molds to move the same forward.

4. A frame provided with an endless guide, a series of disconnected molds adapted to move along said guide, a compressing-drum closing the mouths of said molds during a portion of their travel, means for moving said molds and for compressing material against said drum in said molds, and means for emptying said molds.

5. A frame provided with an endless guide, a series of disconnected contacting molds adapted to slide in said guide, compressing means for moving said molds and for compressing material thereinto, and means for emptying said molds.

6. A compressing-drum, a molding-box, means for guiding the molding-box with its open mouth on the compressing-drum, a plunger in said box, means for engaging the plunger and forcing it inward and at the same time onward, to move the box along its orbit, and means for simultaneously engaging the box to hold it against the drum.

7. A drum, a molding-box, means for guiding the molding-box with its open mouth against the drum, a plunger in the box, rotary means for engaging the plunger to move it inward and onward, and resilient means for engaging the box to hold it against the drum.

8. A drum, a molding-box, means for guiding the molding-box with its open mouth against the drum, a plunger in said box, a gear having a face to engage said plunger and move it inward and onward, and tension-bolts carried by said gear to engage said box and hold it against the drum.

9. A molding-box, means for closing the mouth of the box, means for guiding the box in a path, a plunger in the box, rotary means for engaging the plunger to force it inward as the box moves onward in its path, and means on said rotary means for engaging the box at the same time that the rotary means engages the plunger.

10. A frame, molding means, means for guiding said molding means in a path in said frame, and rotary means yieldingly mounted on the frame and arranged to simultaneously advance and operate said molding means.

11. In a press, a frame, a series of disconnected molds arranged to move in a determined path in said frame, a rock-bar mounted on said frame, rotary compressing means mounted on said rock-bar and constructed to operate said molds, and tension means for holding toward the molds said rotary compressing means.

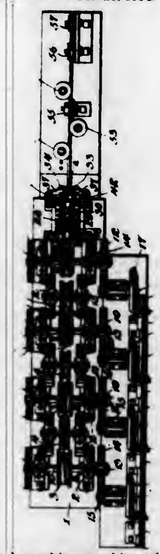
12. In a press, a frame, molding means arranged to move in a determined path in said frame, a rock-bar mounted on said frame, rotary compressing means mounted on said rock-bar and constructed to operate said molding means, and tension means for holding toward the molding means said rotary compressing means, the center of gravity of the rock-bar and its attachments being rearward of the vertical drawn from the shaft of the rock-bar to cause gravity of the compressing means to hold the tension means normally at a constant tension.

13. A briqueting-press provided with a series of disconnected molds, rotary means for operating said molds, rocking means carrying said rotary means, link means for connecting the rocking means with the frame of the press, and yielding tension means for holding said rotary means toward the molds.

14. A frame, molding means moving in an orbit therein, a molding-drum closing the mouths of the molding means at a portion of said orbit, rocking means, a shaft journaled therein, balance-wheels fixed on the shaft, a compressing-gear fixed on the shaft and constructed to operate and advance the molding means successively.

15. Disconnected molding-boxes moving in an orbit, plungers in said boxes respectively having projecting stems, and a rotary ejector-gear arranged to engage said stems to depress the same.

811,861. TUBE-MAKING MACHINE. GEORGE B. MELLINGER, Scottdale, Pa., assignor of two-thirds to Robert Skemp and Joseph R. Stauffer, Scottdale, Pa. Filed Oct. 20, 1904. Serial No. 229,348.



Claim.—1. In a tube-making machine, the combination with skelp-bending mechanism, of edge-flexing mechanism arranged to exert an inward radial pressure upon the tube adjacent to one edge after said tube is formed by the skelp-bending mechanism, and tube-contracting rolls disposed in quartering arrangement to form a constricted pass within which the tube is contracted.

2. In a tube-making machine, the combination with skelp-bending mechanism adapted for the formation of a tube, of a series of edge-flexing rolls disposed to operate upon the tube at successive points after said tube has been formed by the skelp-bending mechanism, and tube-contracting mechanism.

3. In a tube-making machine, the combination with skelp-bending mechanism adapted for the formation of a tube, of a series of edge-flexing rolls arranged to flex one edge of the tube inwardly to present the edges of the skelp out of coincident relation, and tube-contracting rolls disposed in quartering relation about a constricted pass within which the tube is contracted to convolute form.

4. The combination with a series of skelp-bending rolls adapted to bend the skelp into cylindrical form, of edge-flexing rolls disposed beyond the skelp-bending rolls and arranged to flex one edge of the tube inwardly, and tube-contracting rolls located beyond the edge-flexing rolls and forming a constricted pass within which the tube is contracted to lap the edges thereof.

5. In a tube-making machine, the combination with mechanism for bending the skelp to the form of a tube having its edges lapped, of means for expanding the tube to present its edge faces out of lapping relation.

6. In a tube-making machine, the combination with mechanism for bending the skelp into the form of a tube having its edges lapped, of a mandrel arranged to expand the tube to present its edges out of lapping relation.

7. In a tube-making machine, the combination with mechanism for bending the skelp into the form of a tube having lapped edges, of means for expanding the tube to present the edges thereof out of lapping relation, and means for outwardly flexing that edge of the tube having the greatest inward stress, substantially as described.

8. In a tube-making machine, the combination with mechanism for bending the skelp into the form of a tube having its edges lapped, of a mandrel disposed to expand the tube to present its edges out of lapping relation, and an edge-flexing die carried by the mandrel and arranged to flex one edge of the tube outwardly beyond the normal dimensions of the tube.

9. In a tube-making machine, the combination with mechanism for bending the skelp into tubular form, means for flexing one edge only of the tube inwardly, means for contracting the tube, and tube-expanding means.

10. The combination with mechanism for bending the skelp into tubular form, of edge-flexing mechanism arranged to flex one edge of the tube inwardly, tube-contracting mechanism arranged to contract the tube to lap the edges thereof, means for expanding the tube to normal dimensions, and means for flexing outwardly beyond the normal dimensions of the tube that edge of the skelp which was previously flexed inwardly.

11. In a tube-making machine, the combination with an edge-flexing device, of tube-contracting mechanism located beyond the same, tube-expanding mechanism located beyond the contracting mechanism, and a second edge-flexing device located beyond the tube-expanding mechanism, the first edge-flexing device serving to flex an edge of the tube in one direction prior to the contraction and expansion of the tube, and the other edge-flexing device serving to flex the edge of the tube in the opposite direction after the tube has been contracted and expanded.

12. The combination with a series of skelp-bending rolls arranged to bend the skelp into cylindrical form, of an edge-flexing roll, tube-contracting rolls, a tube-expanding mandrel, and an edge-flexing die disposed in the order stated to act successively upon the same portion of the tube.

13. In a tube-making machine, the combination with a series of skelp-bending rolls arranged to bend the skelp into cylindrical form, a series of edge-flexing rolls disposed beyond the skelp-bending rolls to flex one edge of the tube inwardly, tube-contracting rolls disposed in quartering relation about a constricted pass within which the tube is contracted to convolute form, a mandrel disposed to expand the contracted tube to its original cylindrical form, and a die disposed to flex outwardly beyond its normal plane that edge of the tube which was previously flexed inwardly from its normal plane.

14. In a tube-making machine, the combination with means for bending the skelp into the form of a complete butt-joint tube, of means for transforming said butt-joint tube into a lap-joint tube, said last-named means including a series of contracting-rolls arranged to form a constricted pass the wall of which is of volute form.

15. In a tube-making machine, the combination with skelp-bending mechanism, of edge-flexing mechanism arranged to flex one edge of the tube inwardly after said tube is formed by the skelp-bending mechanism, and tube-contracting means for contracting the tube to cause the edges thereof to overlap.

16. In a tube-making machine, the combination with skelp-bending mechanism, of edge-flexing mechanism arranged to exert an inward radial pressure upon the tube adjacent to one edge after said tube is formed by the skelp-bending mechanism, and means for contracting the tube to cause the overlapping of the edges thereof.

17. In a tube-making machine, the combination with skelp-bending mechanism adapted for the formation of a tube, of means for flexing one edge of the tube inwardly to present the edges of the skelp out of coincident relation, and tube-contracting rolls forming a constricted pass within which the tube is contracted to convolute form.

18. In a tube-making machine, the combination with means for bending the skelp into cylindrical form, of means disposed beyond the skelp-bending means for flexing one edge of the tube inwardly,

and means located beyond the edge-flexing means for contracting the tube to cause the overlapping of its edges.

19. In a tube-making machine, the combination with a series of skelp-bending rolls adapted to bend the skelp into cylindrical form, of an edge-flexing roll disposed beyond the skelp-bending rolls and arranged to flex one edge of the tube inwardly to present the edges of the skelp out of coincident relation, and means located beyond the edge-flexing roll for contracting the tube to cause the edges thereof to overlap.

20. In a tube-making machine, the combination with mechanism for bending the skelp into the form of a tube having lapped edges, of means for transforming the tube thus formed into a butt-joint tube, said transforming means including means for outwardly-flexing that edge of the tube having the greatest inward stress.

21. In a tube-making machine, the combination with skelp-bending means arranged to bend the skelp into cylindrical form, of edge-flexing means, tube-contracting means, tube-expanding means, and a second edge-flexing means, all disposed in the order stated to act successively upon the same portion of the skelp.

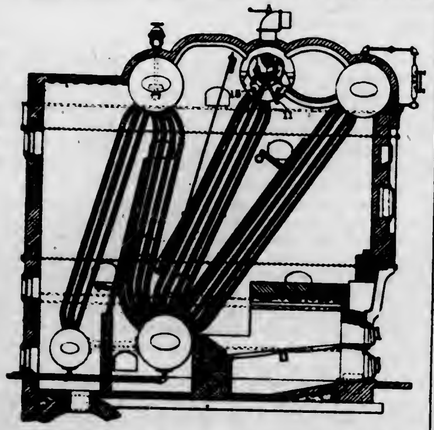
22. In a tube-making machine, the combination with mechanism for bending the skelp to form a butt-joint tube, of mechanism for contracting said butt-joint tube to transform the same into a lap-joint tube, and mechanism for expanding the transformed tube to again produce a tube of the butt-joint type.

23. In a tube-making machine, the combination with skelp-bending mechanism, of an edge-flexing roll arranged to flex one edge of the tube inwardly after said tube is formed by the skelp-bending mechanism, and tube-contracting means for contracting the tube to cause the edges thereof to overlap.

24. In a tube-making machine, the combination with mechanism for bending the skelp into the form of a tube having its edges lapped, of a mandrel disposed to expand the tube to present its edges out of lapping relation, and edge-flexing means arranged to flex one edge of the tube outwardly beyond the normal dimensions of the tube.

25. In a tube-making machine, the combination with mechanism for bending the skelp to the form of a tube having its edges lapped, of mechanism for expanding the tube to urge the inner edge outwardly beyond a point opposite the other edge, whereby when the outward pressure is relieved, the outwardly-expanded edge will spring back to complete the formation of a butt-joint tube.

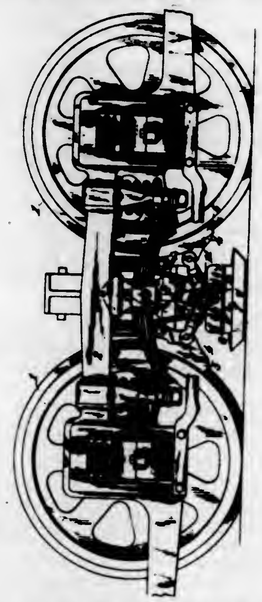
811,862. GUARD FOR BOILER-TUBE CLEANERS. EUGENE METTLER, Indianapolis, Ind. Filed Mar. 17, 1904. Serial No. 198,895.



Claim.—1. The combination, with a water-tube-boiler-cleaning tool of the rotary fluid-stream type, of a guard-tube slidably mounted upon the supply-hose and adapted to incase the tool during the time of transfer from one tube to another, said guard-tube being so constructed as to prevent backward movement of the fluid stream when the guard-tube 2 is extended over the tool.

2. The combination with a water-tube-boiler cleaner of the rotary fluid-stream type, of a guard-tube sleeved upon the supply-hose and provided with a packing at its inner end and adapted to engage the main body of the cleaner, the arrangement being such that said guard-tube may be moved longitudinally upon the supply-hose and may be caused to incase the tool during the time of transfer from one tube to the other.

811,863. AIR-BRAKE. HERBERT H. MULLER and CHARLES V. ROTH, Lancaster, Pa., assignors of one-third to John W. Holman, Lancaster, Pa. Filed July 21, 1904. Serial No. 217,476.



Claim.—1. A car-brake having, in combination, two opposed wheel-brake shoes, an intermediate rail-brake shoe, connections between the brake-shoes whereby the forces applied thereto act in three distinct lines meeting at an intermediate point and are thus caused to react on each other, and brake-actuating mechanism.

2. A car-brake having, in combination, two opposed wheel-brake shoes, an intermediate rail-brake shoe, and a brake-actuating device separately connected to the three brake-shoes for applying them together, the connections causing the forces applied to the several brake-shoes to react on each other.

3. A car-brake having, in combination, two opposed wheel-brake shoes, an intermediate rail-brake shoe, the latter operating in an opposite direction to the former, and a brake-actuating device connected to the three brake-shoes at a substantially central location which is surrounded by the brake-shoes and adapted to apply them all together, the connections causing the forces applied to the several brake-shoes to react on each other.

4. A car-brake having, in combination, two wheel-brake shoes connected by a toggle, a rail-brake shoe, and a brake-actuating device acting between the knuckle of the toggle and the rail-brake shoe so as to raise the former and depress the latter.

5. A car-brake having, in combination, two opposed wheel-brake shoes connected by a toggle, a rail-brake shoe, and a brake-lever having its fulcrum supported by said rail-brake shoe and having an arm taking under the knuckle of the toggle.

6. A car-brake having, in combination, two opposed wheel-brake shoes connected by a toggle, a rail-brake shoe below the knuckle of the toggle, and a wedge adapted to enter between said knuckle and rail-brake shoe to lift the former and depress the latter for application of the brakes.

7. A car-brake having, in combination, two opposed w brake shoes connected by a toggle, a rail-brake shoe below knuckle of the toggle, a brake-lever having an arm taking under the knuckle of the toggle, and a movable wedge adapted to enter between the rail-brake shoe and fulcrum of the lever for depressing said rail-brake shoe by pressure of said fulcrum on said wedge.

8. A car-brake having, in combination, two opposed wheel-brake shoes connected by a toggle, a rail-brake shoe, a bent brake-lever having an arm taking under the knuckle of the toggle, and a movable wedge adapted to enter between the rail-brake shoe and elbow of said lever and sustain pressure thereof as the lever rocks on its elbow as a fulcrum.

9. A car-brake having, in combination, two opposed wheel-brake shoes connected by a toggle, a rail-brake shoe, and a bent brake-lever having its fulcrum supported by said rail-brake shoe and having an arm taking under the knuckle of the toggle, the elbow of said lever having a cam adapted, when the lever is moved for lifting said knuckle, to bear downward and depress the rail-brake shoe

10. A car-brake having, in combination, two opposed wheel-brake shoes connected by a toggle, a rail-brake shoe, and a bent brake-lever having its fulcrum supported by said rail-brake shoe and having an arm taking under the knuckle of the toggle, the elbow of said lever having a cam adapted when the lever is moved to lift said knuckle to bear downward and depress the rail-brake shoe, a movable wedge adapted to enter between the rail-brake block and said elbow of the lever, and means automatically controlling movement of the wedge to compensate for wear of the brake-shoes.

11. A car-brake having, in combination, two opposed wheel-brake shoes connected by a toggle, a rail-brake shoe, a bent brake-lever having an arm taking under the knuckle of the toggle, and a movable wedge adapted to enter between the rail-brake shoe and elbow of said lever and sustain pressure thereof as the lever rocks on its elbow as a fulcrum, and means for automatically varying movement of the wedge to compensate for wear of the brake-shoes.

12. A car-brake having, in combination, two opposed wheel-brake shoes connected by a toggle, a rail-brake shoe below the knuckle of the toggle, a brake-lever having an arm taking under the knuckle of the toggle, and a movable wedge adapted to enter between the rail-brake shoe and fulcrum of the lever for depressing said rail-brake shoe by pressure of said fulcrum on said wedge, and automatic means controlling movement of the wedge to compensate for wear of the brake-shoes.

13. A car-brake having, in combination, two opposed wheel-brake shoes connected by a toggle, a rail-brake shoe below the knuckle of the toggle, and a wedge adapted to enter between said knuckle and rail-brake shoe to lift the former and depress the latter for application of the brakes, and means automatically varying movement of the wedge to compensate for wear of the brake-shoes.

14. A car-brake having, in combination, two opposed wheel-brake shoes connected by a toggle, a rail-brake shoe, and a brake-lever having its fulcrum supported by said rail-brake shoe and having an arm taking under the knuckle of the toggle, and means for automatically increasing the distance between the fulcrum of said lever and the rail-brake shoe to compensate for wear of the brake-shoes.

15. A car-brake having, in combination, two opposed wheel-brake shoes connected by a toggle, a rail-brake shoe, and a brake-lever having its fulcrum supported by said rail-brake shoe and having an arm taking under the knuckle of the toggle, and automatic means for taking up wear of the brake-shoes allowing a constant stroke of the brake-lever.

16. A car-brake having, in combination, two wheel-brake shoes connected by a toggle, a rail-brake shoe, and a brake-actuating device acting between the knuckle of the toggle and the rail-brake shoe so as to raise the former and depress the latter, and an automatic take-up device compensating for wear of the brake-shoes.

17. A car-brake having, in combination, two opposed wheel-brake shoes, an intermediate rail-brake shoe, and a brake-actuating device acting between the rail-brake shoe and wheel-brake shoes for applying them in different directions, and means automatically compensating for wear of the brake-shoes.

18. A car-brake having, in combination, two opposed wheel-brake shoes connected by a toggle, a rail-brake shoe, a brake-lever having an arm taking under the knuckle of the toggle, means for moving said lever to lift said knuckle, a movable wedge adapted to enter between the rail-brake shoe and fulcrum of the lever for depressing said rail-brake shoe by pressure of said fulcrum on said wedge, and means for moving said wedge including a resilient telescopic push-rod therefor containing a spring for yieldingly maintaining the length of said push-rod.

19. A car-brake having, in combination, two opposed wheel-brake shoes connected by a toggle, a rail-brake shoe, a bent brake-lever having an arm taking under the knuckle of the toggle, a wedge adapted to enter between the elbow-fulcrum of said lever and the rail-brake shoe, a main brake-actuating lever, a connecting-rod connected thereto and to the other arm of said bent brake-lever, an intermediate lever having a short arm also connected to said main lever and having a long arm, and a connecting-rod connecting said long arm and said wedge.

20. A car-brake having, in combination, two opposed brake-shoes connected by a toggle, a rail-brake shoe, a bent brake-lever movable transversely of the rail having an arm taking under the knuckle of the toggle, a wedge movable also transversely of the rail adapted to enter between the elbow-fulcrum of said lever and the rail-brake shoe, a main brake-actuating lever, a connecting-rod connected thereto and to the other arm of said bent brake-lever, an intermediate lever having a short arm also connected to said main lever and having a long arm, and a connecting-rod connecting said long arm and said wedge.

21. A car-brake having, in combination, a brake-shoe, an adjacent bearing-surface, a wedge, an actuating device for forcing said wedge between said surface and brake-shoe for applying the brake, and means for automatically varying the movement of said wedge to compensate for wear, allowing a constant movement of said actuating device.

22. A car-brake having, in combination, a brake-shoe, an adjacent bearing-surface, a wedge adapted to be forced between said surface and brake-shoe to apply the brake, and means for moving said wedge comprising a resilient telescopic rod.

23. A car-brake having, in combination, a brake-shoe, an adjacent bearing-surface, a wedge adapted to be forced between said surface and brake-shoe to apply the brake, and means for moving said wedge comprising a push-rod with an included spring adapted to yield when resistance on the wedge overcomes resistance of the spring.

24. A car-brake having, in combination, a brake-shoe, a brake-actuating lever, and an automatic movable take-up device acting between the fulcrum of said lever and brake-shoe to compensate for wear of the brake-shoe.

25. A car-brake having, in combination, a brake-shoe, a brake-actuating lever, and a movable wedge between the fulcrum of the lever and said brake-shoe, the pressure of said fulcrum when on the wedge applying the brake when the lever is moved in operative direction, said wedge being automatically adjustable to take up the wear of the brake-shoe.

26. A car-brake having, in combination, a brake-shoe, a brake-actuating lever whose fulcrum acts against the brake-shoe to apply the brake, and a movable wedge adapted to enter between the fulcrum and brake-shoe as the lever is rocked or turned to apply the brake.

27. A car-brake having, in combination, a brake-shoe, a brake-lever for applying the brake and a movable wedge adapted to engage and shift the fulcrum of the lever, and means controlled by the wear of the brake-shoe for automatically moving said wedge to compensate for the wear.

28. A car-brake having, in combination, a brake-shoe, a cam, and a wedge which when the cam is operated moves between the cam and brake-shoe for applying the latter by pressure from the cam.

29. A car-brake having, in combination, a wheel-brake shoe, a brake-lever having an arm connected therewith, and an adjustable wedge under the fulcrum of said lever, the brake-lever being arranged between the wedge and brake-shoe.

30. A car-brake having, in combination, two opposed wheel-brake shoes connected by a toggle, and a bent brake-lever fulcrumed at its elbow and having an arm which takes under the knuckle of the toggle.

31. A car-brake having, in combination, two opposed wheel-brake shoes connected by a toggle, and a wedge adapted to move under the knuckle of the toggle and lift it in applying the brakes.

32. A car-brake having, in combination, two opposed wheel-brake shoes connected by a toggle, a brake-lever having an arm taking under the knuckle of the toggle, and a wedge under the fulcrum of the lever.

33. A car-brake having, in combination, a rail-brake shoe, a cam, and a wedge which moves between the cam and brake-shoe to depress the latter by coöperative action of said cam and wedge.

34. A car-brake having, in combination, a rail-brake shoe, a bent brake-lever whose elbow-fulcrum acts against the brake-shoe, and a wedge between said elbow and brake-shoe.

35. A car-brake having, in combination, a wheel-brake shoe, a rail-brake shoe, a brake-lever having an arm connected to the wheel-brake shoe and having its fulcrum supported by the rail-brake shoe, and a movable wedge acting between the fulcrum of said lever and said rail-brake shoe.

36. A car-brake having, in combination, a wheel-brake shoe, a rail-brake shoe, and a bent lever having its elbow acting as a fulcrum against the rail-brake shoe and having an arm connected to the wheel-brake shoe.

37. A car-brake having, in combination, a wheel-brake shoe, a

rail-brake shoe, and a bent lever having its elbow acting as a fulcrum against the rail-brake shoe and having an arm connected to the wheel-brake shoe, and a movable wedge acting under the elbow of said lever.

38. A car-brake having, in combination, a wheel-brake shoe, a rail-brake shoe, a bent brake-lever having its elbow-fulcrum supported by the rail-brake shoe and having an arm operatively connected to the wheel-brake shoe, a wedge adapted to enter between the elbow of the lever and the rail-brake shoe, and means for simultaneously moving the wedge and rocking the lever.

39. A car-brake having, in combination, a wheel-brake shoe, a rail-brake shoe, a bent brake-lever having its elbow-fulcrum supported by the rail-brake shoe and having an arm operatively connected to the wheel-brake shoe, a wedge adapted to enter between the elbow of the lever and the rail-brake shoe, means for operating the lever to apply the wheel-brake shoe, and means for more rapidly moving the wedge.

40. A car-brake having, in combination, a brake-shoe, a brake-applying device comprising a wedge, and a push-rod for moving said wedge to operative position having an included spring adapted to yield under a certain resistance, thereby moving said wedge varying distances to compensate for wear of the brake-shoe.

41. A car-brake having, in combination, two wheel-brake shoes connected by a toggle, and a brake-lever movable in a direction transverse to the rail and having an arm taking under the knuckle of the toggle.

42. A car-brake having, in combination, two wheel-brake shoes connected by a toggle, an intermediate rail-brake shoe, a brake-lever operating in a direction transverse to the rail having its fulcrum supported by the rail-brake shoe and having an arm taking under the knuckle of the toggle.

43. A car-brake having, in combination, two wheel-brake shoes connected by a toggle, an intermediate rail-brake shoe, and a brake-actuating device operating in a direction transverse to the rail and acting between the knuckle of the toggle and said rail-brake shoe to raise the former and depress the latter.

44. A car-brake having, in combination, two opposed wheel-brake shoes connected by a toggle, the arms of said toggle having turn-buckles with threaded sockets in their outer ends engaged by threaded stems of members pivoted to the brake-shoes and with plain sockets in their inner ends engaged by plain stems of the knuckle members.

45. A car-brake having, in combination, two opposed wheel-brake shoes connected by a toggle, an intermediate rail-brake shoe, the pintle of the toggle-knuckle passing through a vertical slot in the rail-brake block, a brake-lever movable transversely to the rail having its fulcrum supported by the rail-brake shoe and having an arm taking under the knuckle of the toggle, and a movable wedge acting between the rail-brake shoe and knuckle of the toggle.

46. A car-brake having, in combination, two opposed wheel-brake shoes and a rail-brake shoe between adjacent wheels at each side of a truck, a toggle connecting each pair of wheel-brake shoes, a brake-lever for each set of brakes having a fulcrum supported by the rail-brake shoe and having an arm taking under the knuckle of the toggle, a wedge supported on each rail-brake shoe adapted to act under the fulcrum of the lever, a central lever, connections between it and the opposite brake-levers, and connections between it and the opposite wedges adapted to move the latter more rapidly than the brake-levers.

47. A car-brake having, in combination, two opposed wheel-brake shoes, an intermediate rail-brake shoe, and a brake-actuating device connected to the three brake-shoes at a location intermediate any two of the same and adapted to apply them all together by the same movement, all the brake-shoes being connected to react upon each other.

48. A car-brake having, in combination, two opposed wheel-brake shoes and an intermediate rail-brake shoe having connection at a centralized or inclosed point whereby the forces due to application of the brakes are in approximate equalization, and a brake-actuating device acting at said point and applying the several brakes in opposed directions.

49. A car-brake having, in combination, a wheel-brake shoe, a rail-brake shoe, and a brake-lever having an arm connected to the wheel-brake shoe and having its fulcrum on a movable wedge which acts between said lever and the rail-brake shoe.

50. A car-brake having, in combination, two wheel-brake shoes connected by a toggle, a rail-brake shoe, a brake-lever having an arm supporting the knuckle of the toggle and its fulcrum on a sliding wedge which acts between said lever and the rail-brake shoe.

51. In a car-brake, a rail-brake shoe yieldingly suspended from the truck-frame, a lever operating to depress said shoe, and means for accelerating the movement of the shoe under the action of the lever in proportion to the increased distance the shoe has to travel as it wears away.

52. In a car-brake, a rail-brake shoe, wheel-brake shoes, and a lever adapted to apply the wheel-brake shoes and simultaneously depress the rail-brake shoe, in combination with means acting on said lever to compensate for wear by imparting an accelerated movement to the rail-brake shoe in proportion to the increased distance it has to travel as it wears away.

53. In a car-brake, a rail-brake shoe, wheel-brake shoes, a toggle connecting the latter, a lever having an arm acting on said toggle to apply the wheel-brake shoes and an elbow operating to simultaneously depress the rail-brake shoe, in combination with a sliding wedge adapted to take under said elbow and gradually increase the throw of the lever as the shoe wears away.

54. In a car-brake, wheel-brake shoes, and an intermediate rail-brake shoe, and connections whereby pressure exerted in applying the brakes acts and reacts on each of the connected shoes, in combination with means for exerting such pressure transversely of said connections and of the direction of motion of the car, including an operating-lever movable in the direction of motion of the car, and connections between said operating-lever and such pressure-applying means extending transversely of the car from the center to the sides thereof.

55. In a car-brake, the combination with wheel-brake shoes and an intermediate rail-brake shoe, connections between said shoes for applying pressure thereto, and means for exerting such pressure and imparting a differential speed accelerating the movement of the rail-brake shoe.

56. In a car-brake, the combination with wheel-brake shoes, and an intermediate rail-brake shoe, connections between said shoes for applying pressure thereto, means for exerting pressure on said shoes and accelerating the motion of the rail-brake shoe, and a self-adjusting device for automatically taking up the wear of the rail-brake shoe.

811,864. **DENTAL AND SURGICAL OBTUNDER.** WILLIAM L. MOORE and EDSON L. HUTCHINSON, Honolulu, Hawaii. Filed Apr. 24, 1905. Serial No. 257,104.

Claim.—1. An obtunder comprising a hand-tool provided with a chamber containing an anesthetizing medium and having means to hold a frangible capsule, means for puncturing the capsule, and means for delivering the contents of the fractured capsule into said chamber to produce a pressure to expel said anesthetizing medium.

2. An obtunder comprising a hand-tool having a chamber containing an anesthetizing medium, said chamber having a valve-controlled outlet, said tool also having means to hold a frangible capsule, means for puncturing said capsule, said hand-tool having passages communicating with said chamber whereby on the puncturing of said capsule the contents of the latter are expanded into the chamber.

3. An obtunder comprising a casing having a chamber containing an anesthetizing medium, said chamber having an outlet-passage, a part movable relative to the casing and having a chamber to contain a frangible capsule, means for puncturing the capsule and communicating passages between the two chambers whereby on the puncturing of the capsule the contents of the latter are expanded into the anesthetizing-chamber.

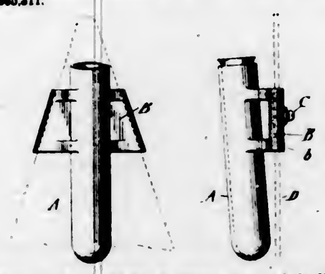
4. The combination of a casing having a chamber containing a packing saturated with a vaporizable medium, said chamber having a valve-controlled outlet, a cap screwing onto said casing and having a chamber to contain a frangible capsule, a puncturing-tool in the path of the contained capsule and communicating passages between the two chambers whereby the contents of the capsules may be expanded into the chamber in the casing.

5. The combination of a casing provided with an exit-tube and having the chamber to contain a vaporizable medium, caps screwing onto each end of said casing, one of said caps having a chambered portion to contain a frangible capsule, a puncturing-tool and passages communicating with the chamber in the casing to deliver the contents of the fractured capsule.

6. The combination of a hollow casing, caps screwing onto opposite ends thereof, one of said caps provided with a valved discharge and having a tubular projection which communicates with said discharge extending into the chamber in the casing, means at the opposite end of the casing for holding a frangible capsule, a puncturing-tool, means for compressing said capsule, and means for delivering the contents of the punctured capsule into the chamber in the casing.

7. The combination of a casing having a chamber to contain a vaporizable medium, said chamber having a valved discharge-tube, a hollow cap screwing onto the casing adapted to contain a frangible capsule, a puncturing-tool on the adjacent end of the casing and said casing having ports communicating with the chamber in the casing to deliver the contents of the punctured capsule.

811,865. **CENTRIFUGE ATTACHMENT FOR ELECTRIC FANS.** WILLIAM L. MOORE, Honolulu, Hawaii. Filed June 15, 1905. Serial No. 265,311.



Claim.—1. An attachment for electric fans and the like, comprising a socket to receive a test-tube, and means for securing said socket to a fan-blade.

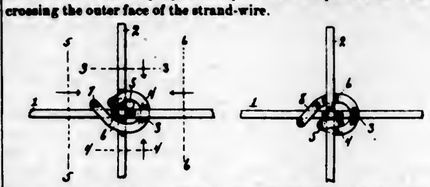
2. An attachment for electric fans and the like, comprising a socket to receive a test-tube, and lateral arms for securing said socket to a fan-blade.

3. An attachment for electric fans and the like, comprising a socket to receive a test-tube, lateral arms having flanges adapted to engage the edges of a fan-blade, and means for locking said flanges to the blade.

4. An attachment for electric fans and the like, comprising a tubular receptacle to receive a test-tube, lateral arms extending therefrom, inturned flanges on said arms, and screws for securing the arms to a fan-blade.

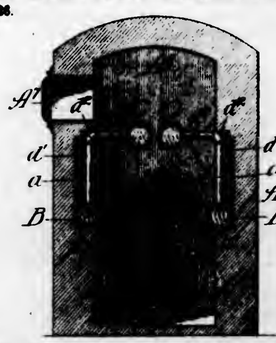
811,866. **FENCE-TIE.** OSCAR D. MORSE, Adrian, Mich. Filed May 25, 1905. Serial No. 262,169.

Claim.—1. In a tie for wire fencing, the combination with the crossed strand and stay wires crimped at their point of crossing, of a tie-wire in the form of a staple having its loop end contacting and crossing the strand-wire at one side of the stay-wire, legs passing in the rear of the stay-wire, the terminal of one leg being formed into a backwardly-turned eye which embraces the stay-wire close to the strand-wire, the terminal of the other leg crossing the strand-wire beyond the stay-wire in the rear of said strand-wire, its end being bent in the form of an embracing eye around the strand-wire and crossing said strand-wire obliquely in the plane of that portion of the leg crossing the outer face of the strand-wire.



2. In a tie for wire fencing, the combination with the crossed strand and stay wires crimped at their point of crossing, of a tie in the form of a staple having its loop end contacting and crossing the outer face of the strand-wire, one leg of the staple passing in the rear of the stay-wire and in the rear of the strand-wire, its terminal being formed into an embracing eye around the strand-wire, the other leg passing in the rear of the stay-wire only and having its terminal formed into an embracing eye around the stay-wire adjacent the strand-wire.

811,867. **FURNACE.** JOHN J. O'SHEA and JEREMIAH O'SHEA, Chicago, Ill. Filed Dec. 18, 1903. Renewed Dec. 26, 1905. Serial No. 293,336.



Claim.—1. In a furnace of the character described, the combination of a combustion-chamber provided with a suitable grate, substantially horizontal pipes arranged along opposite sides of the lower portion of said combustion-chamber, series of tubes rising from said pipes within said combustion-chamber, a substantially horizontal tubular grate in communication with said series of tubes, and a superposed combustion-chamber, of which said second-named grate forms the bottom, said last-named chamber having a charging-door and a smoke-stack connection, for the purpose set forth.

2. In a furnace of the character described, the combination of a combustion-chamber provided with a suitable grate and adjacent to said grate with ledges, substantially horizontal water-pipes located above said ledges, a superposed combustion-chamber, a pair of parallel pipes located between the lower and upper combustion-chambers, and water-tubes joining the pipes and comprising horizontal and vertical members, the horizontal members forming with the second-named pair of pipes a tubular grate for the upper combustion-chamber, for the purpose set forth.

3. In a furnace of the character described, the combination of a combustion-chamber provided with a suitable grate, a pair of longitudinal pipes located at the sides of said combustion-chamber near the base thereof and having ends projecting through the end walls of the furnace, a common supply-pipe for the said pipes, substantially vertical tubes rising from said first-named pipes, and a tubular grate at the upper portion of said combustion-chamber comprising in its structure substantially horizontal tube-sections and a longitudinal pipe or pipes in communication therewith and having ends projecting through the end walls of said furnace, for the purpose set forth.

4. In a furnace of the character described, the combination of a combustion-chamber provided with a suitable grate, a pair of pipes arranged at opposite sides of the lower portion of said combustion-chamber and having ends projecting through an end wall of said furnace, a transverse supply-pipe communicating with the projecting ends of said first-named pipes, a pair of centrally-located pipes at the upper portion of said combustion-chamber having ends projecting

through an end wall of the furnace, a transversely-extending outgoing pipe communicating with the projecting ends of said last-named

Claim.—1. In a furnace, a casing divided into separate heating-

of the brackets and supported by the flanges thereof and composed of

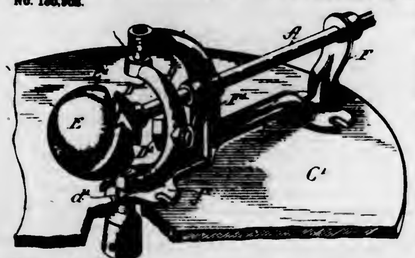
3. In a heating-device, a casing

through an end wall of the furnace, a transversely-extending outgoing pipe communicating with the projecting ends of said last-named pair of pipes, and a series of tubes connecting each member of said first-named pair of pipes with the corresponding member of said second-named pair of pipes and comprising horizontal sections forming with said pair of centrally-located pipes a tubular grate.

5. In a furnace of the character described, the combination of a combustion-chamber provided with a suitable grate and having recessed walls, a pair of pipes located in the lower portion of the recesses of said walls, a pair of centrally-located pipes having their ends supported in the end walls of said furnace above said first-named pipes, and a series of tubes connecting each member of said first-named pair of pipes with the corresponding member of said second-named pair of pipes, each tube having a substantially vertical portion lying in a recess of the corresponding wall and a substantially horizontal portion communicating with the corresponding member of said second-named pair of pipes, for the purpose set forth.

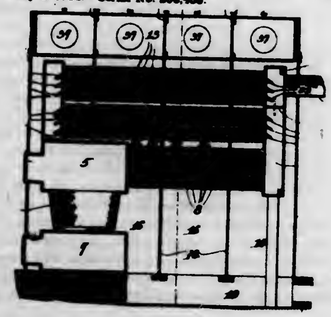
6. In a furnace of the character described, the combination of a combustion-chamber provided with a suitable grate, a pair of horizontal pipes located at opposite sides of the lower portion of said combustion-chamber and having ends projecting through the end walls of said furnace and equipped with removable plugs, a series of tubes rising from each one of said pipes within the combustion-chamber, a superposed combustion-chamber, and a tubular grate, comprising in its structure a pipe or pipes having ends projecting through the end walls of said furnace and equipped with removable plugs, and substantially horizontally disposed tubes in communication with said last-named pipe or pipes and said first-named tubes, for the purpose set forth.

811,868. **MECHANICAL MOVEMENT.** HANS J. PAARMANN, Davenport, Iowa, assignor to H. F. Brammer Manufacturing Company, Davenport, Iowa, a Corporation of Iowa. Filed Dec. 21, 1903. Serial No. 186,962.



Claim.—The combination with a rotative shaft provided at its end with a spherical head having on its surface an irregular groove, and a frame in which said shaft has bearing, of an oscillatory yoke which oscillates about an axis at right angles to the axis of said rotative shaft and provided between its ends with a rotatively-mounted shoe which traverses said groove of the head, said yoke being provided at its upper end with an integral stud, and the frame being provided with a socket engaged by said stud, and the lower end of the yoke being provided with a cylindric bearing adapted to engage a bearing in said frame and provided below said bearing portion with a downwardly-opening socket.

811,869. **HOT-AIR FURNACE.** NATHAN POOR, Peabody, Mass. Filed May 5, 1904. Serial No. 206,426.



Claim.—1. In a furnace, a casing divided into separate heating-chambers, a combustion-chamber, a plurality of heating-flues through which hot gases of combustion circulate, said flues passing through the heating-chambers, and means to close all communication between said combustion-chamber and one or more of said flues.

2. In a furnace, a casing divided into separate heating-chambers, a combustion-chamber, a plurality of flues for hot products of combustion, said flues passing through said heating-chambers, and dampers for closing the ends of some of the flues.

3. In a furnace, a casing divided into separate heating-chambers, a distributing-pipe connected to each heating-chamber, a cold-air chamber common to all the heating-chambers, a combustion-chamber, flues through which the hot products of combustion from the combustion-chamber circulate, said flues extending through the heating-chambers, and means for closing all communication between said combustion-chamber and certain of the flues.

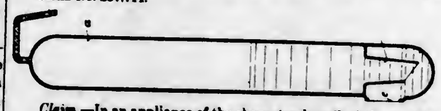
4. In a furnace, a casing divided into separate heating-chambers, a heater within said casing, said heater having a combustion-chamber, a rear chamber, flues connecting said combustion-chamber and rear chamber, a front drum, other flues connecting the rear chamber and the front drum, a smoke-chamber and still other flues connecting the front drum and smoke-chamber, said flues passing through the various heating-chambers, a distributing-pipe connected to each heating-chamber and means to close the ends of a portion of said flues.

5. In a furnace, a casing divided into separate heating-chambers, a heater within said casing, said heater having a combustion-chamber, a rear chamber, flues connecting said combustion-chamber and rear chamber, a front drum, other flues connecting the rear chamber and the front drum, a smoke-chamber and still other flues connecting the front drum and smoke-chamber, said flues passing through the various heating-chambers, a distributing-pipe connected to each heating-chamber, and means to close the ends of one or more of the flues whereby the amount of effective heating-surface in the heating-chambers can be varied.

6. In a furnace, a plurality of heating-chambers, a distributing-pipe connected to each heating-chamber, means to heat the air on its passage through said heating-chambers, and means to connect one heating-chamber to a second heating-chamber, and to simultaneously and independently connect a third heating-chamber to a fourth heating-chamber.

7. In a furnace, a plurality of separate heating-chambers, a distributing-pipe connected to each heating-chamber, means to heat the air on its passage through each heating-chamber, a distributing-trunk divided into compartments, dampers controlling openings between adjacent compartments, and other dampers controlling openings between the compartments of the trunk and the adjacent heating-chambers.

811,870. **DRINKING AND FEEDING APPLIANCE FOR BIRD-CAGES.** HERMANN QUITTNER, Berlin, Germany. Filed Dec. 20, 1904. Serial No. 237,714.



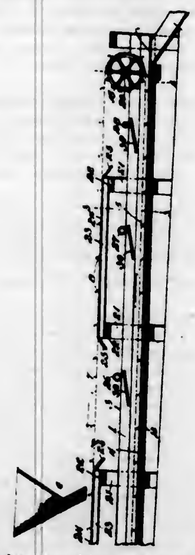
Claim.—In an appliance of the character described, the combination, with a tubular vessel closed at the top and bottom and having an aperture at one side near the bottom, of a transverse partition formed just above the upper edge of said aperture and provided with an opening, and a tube depending from said opening and having its lower end open and cut obliquely to the longitudinal axis of the tube, substantially as and for the purpose herein set forth.

811,871. **COAL-WASHER.** GEORGE S. RAMSAY, St. Marys, Pa. Filed Oct. 10, 1903. Serial No. 176,569.

Claim.—1. A coal-washer, comprising a sluiceway, an endless belt or belts, and scrapers carried by the endless belt or belts and composed of a body portion arranged to clear the sluiceway, an inclined strip of yieldable material arranged on the front face of the body portion and inclined backwardly from the direction of advance of the scrapers and having its edge engaging the bottom of the sluiceway, and means for securing the strip of yieldable material to the said body portion.

2. A coal-washer, comprising a sluiceway, sprocket-wheels, endless chains having brackets arranged at intervals and provided with seats and projecting flanges, and scrapers mounted in the seats

of the brackets and supported by the flanges thereof and composed of a body portion arranged to clear the sluiceway and having its front inclined backward from the direction of advance of the scrapers, an inclined elastic strip arranged on the front face of the body portion and supported by the same and having its edges engaging and adapted to be flexed by the sluiceway, and means for supporting the elastic strip.



3. A coal-washer, comprising a sluiceway having a glass bottom-lining presenting a smooth surface, an endless belt or belts provided with scrapers of yielding material engaging the glass bottom, and means for feeding material and water to the sluiceway, whereby both the scrapers and the glass bottom are wet and the former are caused to adhere to the latter.

4. A coal-washer, comprising a sluiceway having a glass bottom-lining presenting a smooth upper face, an endless belt or belts provided with scrapers operating in the sluiceway, said scrapers being provided with rigid bottom portions, yielding projecting portions engaging the glass lining, and means for supplying water to the sluiceway.

5. A coal-washer, comprising a sluiceway provided with a smooth bottom-lining of glass and having metallic side linings, an endless belt or belts provided wjth scrapers having projecting yieldable portions, the edges of the yieldable portions being engaged with the bottom and sides of the sluiceway, and means for supplying water to the sluiceway.

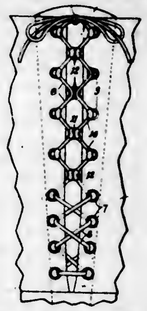
6. A coal-washer, comprising an inclined sluiceway, scrapers operating in the sluiceway, a coal-chute discharging into the sluiceway, and a plurality of water-supply pipes arranged in spaced relation between the coal-chute and the upper end of the sluiceway, one of the pipes being of reduced diameter and discharging clear water into the sluiceway near the upper end thereof to clarify the same and expose the material carried by the scrapers.

7. A coal-washer, comprising an inclined sluiceway, an endless belt or belts provided with scrapers operating in the sluiceway, and transversely-disposed water-supply pipes of different diameters, the larger pipe being adapted to discharge water which has been used, and the smaller pipe being arranged at the upper portion of the sluiceway and discharging clear water to clarify the same and to expose to view the material carried by the scrapers.

811,872. **LACING DEVICE.** MOSES RIES, Milwaukee, Wis. Filed June 18, 1904. Serial No. 213,096.

Claim.—1. In a lacing device, a pair of flaps, curved tubular lacing-guides carried thereby, a lacing having sections for each flap passing through the lacing-guides of said flap, and intermediate lacing-guides having a pair of oppositely-curved guide-tubes through which the lacing-sections of both flaps are passed between their connections with the lacing-guides of the flaps.

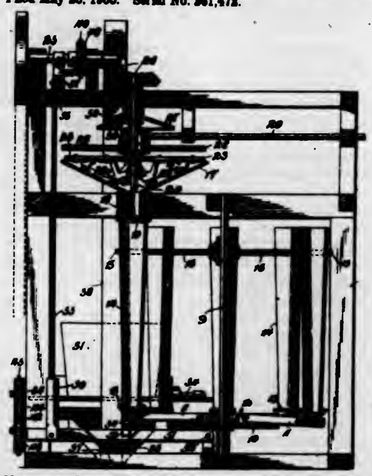
2. In a lacing device, a pair of flaps, lacing-guides carried thereon comprising curved guide-tubes, a tongue member underlapping the flaps, double lacing-guides carried thereby comprising a pair of curved guide-tubes, and a lacing having portions passed through the guide-tubes of each flap independent of the other, the guide-tubes of the double lacing-guides of the tongue member receiving the lacing of each of the flaps between the guide-tubes of said flaps.



3. In a lacing device, a lacing-guide comprising a securing means, and a pair of oppositely-disposed curved guide-tubes carried thereby.

4. In a lacing device, a lacing-guide comprising a pair of joined oppositely-disposed curved guide-tubes.

811,873. **MOLDING-MACHINE.** JOHN ROEMER, Platteville, Wis. Filed May 20, 1905. Serial No. 261,472.



Claim.—1. In apparatus of the class described, the combination with a mold-support, of a mold mounted thereon, mixing mechanism mounted over the mold, means for delivering the material from the mixing mechanism to the mold, an elevator delivering to the mixing mechanism, and measuring mechanism delivering the material to the lower portion of the elevator.

2. In apparatus of the class described, the combination with a movable mold, of mixing mechanism mounted thereover, means for delivering the material from the mixing mechanism to the mold, an elevator located at one side of the mold-support and delivering to the mixing mechanism, and measuring mechanism located at one side of the mold-support and having a delivery-spout associated with the boot of the elevator.

3. In apparatus of the class described, the combination with a movable carrier, of a plurality of molds mounted thereon, mixing mechanism mounted thereover and including a hopper having a delivery-spout disposed at one side of the axis of rotation of the carrier, the molds on said carrier being successively movable into alinement with the spout, means for controlling the passage of material to the molds, and means for feeding material to the mixing mechanism.

4. In apparatus of the class described, the combination with a mold-support, of a mold mounted thereon, a hopper located thereover and delivering to the mold, mixing and moistening mechanism

pivotally mounted on the carrier, a vertically-movable actuating device located beneath the carrier, and means for operating the device,

said enlarged end having a central slot open at one end, a slot eccentric to the center slot communicating at right angles with its open

the receptacle covered with a protecting medium composed of compressed dinitrocellulose.

4. In apparatus of the class described, the combination with a mold-support, of a mold mounted thereon, a hopper located thereover and delivering to the mold, mixing and moistening mechanism mounted on the hopper, means for feeding material to the hopper, and a spreader located between the feeding means and hopper, and means for controlling the passage of mixed material from the hopper to the molds.

5. In apparatus of the class described, the combination with a carrier, of a plurality of molds mounted on the carrier, a hopper located over the carrier and having a delivery-spout disposed over the path of movement of the molds, mixing mechanism mounted in the hopper, means for feeding material to the hopper, and a downwardly and outwardly inclined spreader located between the feeding means and hopper and over the mixing means.

6. In apparatus of the class described, the combination with a mold-support, of a mold mounted thereon, a hopper delivering to the molds, an upright rotatable shaft, mixers carried by the shaft and located in the hopper, a downwardly-inclined conical spreader-table secured to the shaft and located over the hopper, means for delivering material upon the table, and means for controlling the passage of mixed material from the hopper to the mold.

7. In apparatus of the class described, the combination with a movable support, of molds located thereon, a hopper located thereover and delivering successively to the molds, rotatable mixing means operating in the hopper, means for controlling the passage of material from the hopper to the molds, and rotatable sprinkling means located over the hopper.

8. In apparatus of the class described, the combination with a rotatable carrier, of a plurality of molds mounted thereon and rotatable therewith, a hopper located over the carrier at one side of its axis of rotation and having a delivery-spout disposed over the path of movement of the molds and delivering to said molds, mixing and sprinkling means movably mounted in and over the hopper, means for controlling the passage of material through the delivery-spout to the molds, and means for feeding material to the hopper.

9. In apparatus of the character described, the combination with a rotary carrier, of a plurality of radiating mold-supporting arms pivoted upon the carrier, means for swinging the arms to jar the molds mounted thereon, and means for feeding concrete to the molds.

10. In apparatus of the character described, the combination with a rotary carrier, of a plurality of radiating arms pivoted at their inner ends upon the carrier, molds supported on the outer ends of the arms, means for successively swinging the arms to jar the molds mounted thereon, and means for feeding concrete to each mold while the same is being jarred.

11. In apparatus of the class described, the combination with a rotatable carrier, of a plurality of oscillatory mold-supports pivotally mounted on the carrier, and rotatable therewith, and means for successively oscillating the supports.

12. In apparatus of the character described, the combination with a movable carrier, of a plurality of molds movably mounted thereon and movable therewith, common means for successively shaking the molds, and common means for feeding material successively to the molds, said shaking and feeding means operating simultaneously on the same mold.

13. In apparatus of the character described, the combination with a movable carrier, of a plurality of molds movably mounted thereon and movable therewith, common means located below the molds for successively shaking the same, said molds being successively movable into coöperation with the shaking means, and means for feeding material successively toward the molds, said feeding means being disposed over the shaking means and operating simultaneously therewith on the same mold.

14. In apparatus of the character described, the combination with a rotatable carrier, of a plurality of radiating arms pivoted at their inner ends upon the carrier, molds mounted on the outer ends of the arms, means for successively oscillating the arms, said arms being successively movable over the operating means, and concrete-feeding means located above the oscillating means and arranged to feed material to the mold that is being operated by the oscillating means.

15. In apparatus of the class described, the combination with a vertically-movable oscillatory and pivotally-mounted mold-support, of a pivotally-mounted actuating-bar located beneath the same and movable in an upright direction, and means for effecting the movement of the bar to oscillate the support.

16. In apparatus of the class described, the combination with a rotatable carrier, of a plurality of oscillatory mold-supporting arms pivotally mounted on the carrier, a vertically-movable actuating device located beneath the carrier, and means for operating the device, said mold-supporting arms being successively movable over and into the path of movement of the actuating device upon the rotation of the carrier.

17. In apparatus of the class described, the combination with a rotatable carrier, of a plurality of mold-supporting arms pivotally mounted on the carrier, a pivoted actuating-bar located beneath the carrier, said mold-supporting arms being rotatable with the carrier and successively movable into and out of the path of movement of the actuating bar, and means associated with the bar for effecting the movement thereof.

18. In apparatus of the class described, the combination with a movable carrier, of a plurality of mold-supports movably mounted on and movable with the carrier, means located over the carrier for feeding material successively to the molds, and means located beneath the carrier for successively shaking the mold-supports while the material is being fed thereto.

19. In apparatus of the class described, the combination with a rotatable carrier, of a plurality of molds movably mounted thereon, means located above the carrier and over the path of movement of the molds for successively feeding material thereto, and means located beneath the molds for successively shaking the same while material is being fed thereto.

20. In apparatus of the class described, the combination with a rotatable carrier, of a plurality of mold-supporting arms pivotally mounted on the carrier, means for mixing and feeding material to the molds of the carrier, said means including a hopper having a delivery-spout disposed above the path of movement of the molds mounted on the arms, a shaking arm pivotally mounted beneath the carrier and beneath the spout of the hopper, said arm being arranged to engage the mold-supporting arms for successively moving the same when beneath the hopper, and common means for moving the arm and the mixing and feeding mechanism.

21. In apparatus of the class described, the combination with a support movable in an upright direction, of means for effecting the movement of the support, a cupped holder mounted on the support, and a mold having an open bottom that fits in the cupped holder.

22. In apparatus of the class described, the combination with a support movable in an upright direction, of means for effecting the movement of the support, a cupped holder mounted on the support, a guide located above the holder, and a mold slidably mounted in the guide and having an open bottom that detachably fits in the cupped holder

23. In apparatus of the class described, the combination with a mold-support, of mixing mechanism located thereover, means for feeding material from the mixing mechanism to a mold placed on the support, a revoluble spreader located over the mixing mechanism and delivering material thereto, and means for feeding material to said revoluble spreader.

24. In apparatus of the class described, the combination with a mold-support, of a hopper located thereover and delivering to the molds placed on the support, mixing mechanism operating in the hopper, a rotary spreader located over the hopper and of less diameter than the same, means for feeding material to the spreader, and a sprinkler located over the hopper and beneath the spreader, said sprinkler delivering water to the hopper.

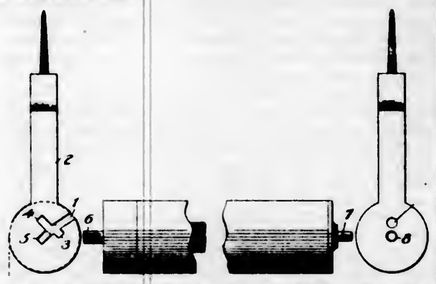
25. In apparatus of the class described, the combination with material-mixing means, of means for sprinkling water slowly thereupon during the stirring action, means for feeding the mixture to a mold, and means for imparting a shaking movement to the mold during the feeding action to compact the material therein as rapidly as it is fed thereto.

26. In apparatus of the class described, the combination with material-mixing means, of means for moistening the material while being mixed, means for feeding the mixture to a mold, and means for shaking the mold during the feeding action.

27. In apparatus of the class described, the combination with means for measuring material and mixing the same in a dry state, of means for thoroughly stirring the mixture and sprinkling water slowly thereupon during the stirring action, means for feeding the mixture to a mold, and means for imparting a shaking movement to the mold during the feeding action to compact the material therein as rapidly as it is fed thereto.

811,874. **WINDOW-SHADE BRACKET.** EMMA M. RUFF, Brooklyn, N. Y. Filed Sept. 26, 1905. Serial No. 280,114.

Claim.—1. A bracket for a shade-roller, consisting of a plate enlarged at one end, its other end terminating in an attaching-screw, said enlarged end having a central slot open at one end, a slot eccentric to the center slot communicating at right angles with its open end, a recess communicating at right angles with said open end at the other side of the central slot, and an open slot communicating with the eccentric slot and the recess in alinement with the central slot, for the purpose stated.



2. A bracket for shade-roller, consisting of a plate enlarged at one end, its other end terminating in an attaching-screw, said enlarged end having a central slot open at one end, a slot eccentric to the center slot communicating at right angles with its open end at one side, a recess communicating with said open end at right angles to the other side of said central slot, and an open slot communicating with the eccentric slot and said recess in alinement with the central slot, in combination with a companion bracket having a pair of openings, one central and the other eccentric thereto, for the purpose stated.

811,875. **INSECT-CATCHER.** JACOB SAMUELS, Chicago, Ill., assignor to Bee-Hive Fly Catcher Company, Kenosha, Wis., a Corporation of Wisconsin. Filed Apr. 4, 1904. Serial No. 201,507.

Claim.—1. An insect-catcher comprising two helical members coated with an adhesive substance, the axes of which members are substantially coincident.

2. An insect-catcher made from a piece of sheet material, said material having two spiral slits therein whose axes are substantially identical, the material between said slits being connected by a central portion, whereby said sheet may be extended in the direction of its thickness, portions of said sheet material being coated with an adhesive substance.

811,876. **MEANS FOR CORKING OR CLOSING BOTTLES OR OTHER RECEPTACLES.** CONRAD SCHROEDER, Milwaukee, Wis. Filed Oct. 15, 1904. Serial No. 228,608.

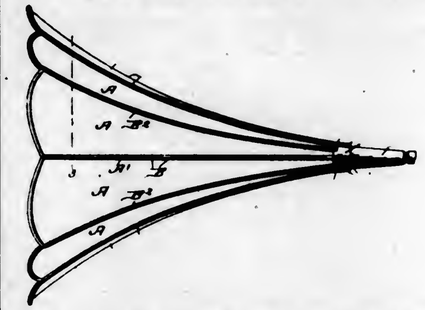
Claim.—1. A stopper or closure for receptacles, consisting of a device adapted to be applied to and close the opening of a receptacle, the said device having the surface thereof which is exposed to the contents of the receptacle covered with a protecting medium of dinitrocellulose, said protecting medium being of dinitrocellulose both when originally applied to the stopper or closure, and after application thereto.

2. A stopper or closure for receptacles, consisting of a device adapted to be applied to and close the opening of a receptacle, the said device having its entire surface covered with a protecting medium of dinitrocellulose said protecting medium being of dinitrocellulose both when originally applied to the stopper or closure, and after application thereto.

3. A stopper or closure for receptacles, consisting of a device adapted to be applied to and to close the opening of a receptacle, said device having the surface thereof which is exposed to the contents of the receptacle covered with a protecting medium composed of compressed dinitrocellulose.

4. A stopper or closure for receptacles, consisting of a device adapted to be applied to and to close the opening of a receptacle, said device having its surface covered with a protecting medium, the said protecting medium composed of compressed dinitrocellulose.

811,877. **PHONOGRAPH-HORN.** CAMILLUS A. SENNE, New York, N. Y. Filed Nov. 1, 1904. Serial No. 231,008.



Claim.—1. A horn comprising a series of blades, each having flanges upon their longitudinal edges, ribs engaging said flanges, and a sleeve having tubular portions in which the alternate ribs are held.

2. A horn comprising a series of blades, each having flanges upon their longitudinal edges, ribs engaging said flanges, a sleeve having tubular portions in which the alternate ribs are held, and a tube-nozzle for supporting the said sleeve.

3. A horn comprising a series of blades, each having flanges upon their longitudinal edges, ribs engaging the flanges, the alternate ribs projecting beyond the inner ends of the blades, a sleeve having tubular sections in which the projecting ends of the ribs are held, a tube-nozzle for supporting the sleeve and strips engaging the remaining alternate ribs.

4. A horn comprising a series of flanged blades arranged in pairs, the blades of each pair being united by means of ribs which extend beyond the inner ends of the blades, tubular ribs for uniting the abutting edges of each pair, and means for engaging the projecting ends of the first-named ribs.

5. A horn comprising a series of blades arranged in pairs each pair having a rib projecting therefrom, a sleeve having tubular portions in which the projected ends of the ribs are held, tubular ribs for uniting the edges of each pair of blades, strips arranged within the said tubular ribs, and a tube-nozzle for supporting the sleeve.

6. A horn comprising a series of tapering blades, each being flanged upon their longitudinal edges, tubular ribs engaging the abutting flanges of each blade for locking the said blades together, the alternate ribs projecting beyond the inner ends of blades, a sleeve having tubular sections in which the projected ends of the ribs are held, and a tube-nozzle for supporting the sleeve.

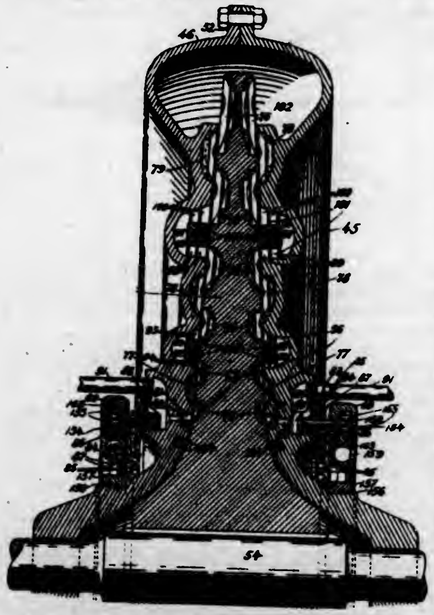
7. A horn comprising a series of blades, each being tapered from its outer to its inner end, and flanged along the said tapering edges, tubular ribs engaging the flanges for uniting the blades, the alternate ribs projecting beyond the blades and made solid, strips arranged within the opposite alternate ribs, and a sleeve connected to the projected ends of the ribs.

8. A horn of the kind described, comprising a series of tapering blades arranged in pairs, each blade being flanged upon its longitudinal tapering edges, said blades being arranged in pairs, ribs engaging the flanges to unite the blades to form the pairs, said ribs projecting beyond the inner ends of each pair, a sleeve having tubular portions in which the projected ends of the ribs are held, tubular ribs engaging the abutting flanges of each pair, and strips arranged within the last-named ribs.

9. A horn of the kind described, comprising a series of tapering blades, each having a flange upon its longitudinal edges, said blades being arranged in pairs, and held together by tubular ribs, the ends of which project beyond the inner ends of the blades, a sleeve having tubular portions in which the projected ends of the ribs are held, tubular ribs engaging the abutting flanges of each pair of blades, semi-cylindrical strips arranged within the last-mentioned ribs and engaging the flanges of the blades for the purpose specified.

10. A horn comprising a series of longitudinal tapering blades, each having its longitudinal edges bent outwardly and inwardly to form flanges which diverge when the abutting edges of the flanges are placed together, tubular ribs fitting over the flanges, the alternate ribs projecting beyond the inner ends of the blades, a sleeve having tubular sections in which the said projecting ends of the ribs are held, the remaining alternate ribs being of the same length as the blades, and strips arranged within the last-mentioned ribs, said strips having one end bent to provide a ring all substantially as and for the purpose specified.

811,878. STEAM-TURBINE. WILLIAM B. SHEPARD, Paris, France. Filed July 13, 1904. Serial No. 216,274.



Claim.—1. An elastic-fluid turbine comprising a rotating disk and fixed envelop having reëntrant inclosed guiding-passages so constructed on each that the coördination of the fixed and moving inclosed guiding-passages, present a free, direct and unobstructed passage for the fluid to exhaust in a continuous and radial sinusoidal movement.

2. An elastic-fluid turbine comprising a rotating disk, having concentric rows of radially-positioned inclosed reëntrant guiding-passages on one side thereof adapted to receive an elastic motive fluid at one end and reflect it in a backward direction at the other end as regards each of said passages; said ends being parallel with each other and located along the same radial line.

3. An elastic-fluid turbine comprising a rotating disk and fixed envelop having reëntrant inclosed guiding-passages successively longer and longer from the admission-passages, and so constructed in each that the coördination of the fixed and moving guiding-passages present an open, continuous, and unobstructed passage, of continuously-increasing cross-section from the entrance of the passage to the exhaust.

4. An elastic-fluid turbine comprising a rotating disk having concentric rows of reëntrant inclosed guiding passage-ways on one side thereof, means for continuously delivering to said passage-ways at their ends nearest to the axis an elastic motive fluid of a predetermined and uniform density whereby they are caused to exhaust said fluid in tangential directions with respect to the direction of rotation of the disk at their ends farthest from the axis, the two ends of each passage-way being disposed on the same radial line relatively to the axis of said disk.

5. An elastic-fluid turbine comprising a rotating disk having reëntrant inclosed guiding-passages in concentric rows on one side thereof adapted to receive an elastic motive fluid in a forward tangential direction at their ends nearest the axis, reflecting it in a backward tangential direction at their ends farthest from the axis, in combination with ports in concentric rows communicating between any exhaust end of any of said passages and the next succeeding admission end, the ends of the ports and passages being grouped in radial lines.

6. An elastic-fluid turbine comprising a rotating disk having two or more concentric circular series of curved, radially-positioned guiding-surfaces therein, a series of nozzles adapted to project the motive fluid against each of said series of guiding-surfaces in succession, and means for taking up steam-exhaust from the first series and directing it into the nozzles of the second series.

7. An elastic-fluid turbine comprising a rotating disk having concentric rows of reëntrant inclosed guiding-passages on one side thereof, whose openings are radially disposed and adapted to receive an elastic motive fluid and reflect it in a backward direction, in combination with one or more expansion-nozzles adapted to project a stream of elastic motive fluid into said passages in a partly or wholly tangential direction.

8. An elastic-fluid turbine comprising a discoid rotating member and an envelop therefor, each having reëntrant inclosed guiding-passages so constructed that the coördination of these guiding-passages shall present an open and continuous passage of gradually and continuously increasing section and length from the entering end to the exhaust end.

9. An elastic-fluid turbine comprising a rotating member, a stationary member juxtaposed thereto, a plurality of circular series of reëntrant inclosed guiding-passages on the adjacent sides of said two members, each adapted to receive the motive fluid from the other and reflect it back, and means for directing one or more streams of such fluid into the innermost series of rotating passages whereby said fluid is caused to pass radially outward, acting a succession of times upon said rotating member to impel the same, each rotating reëntrant guiding-passage consisting of a recess in the face of said rotating member with plane sides and a curved bottom and top.

10. An elastic-fluid turbine comprising a rotating member having circular series of guiding-surfaces upon one face thereof adapted to receive and reflect a current of elastic motive fluid, a stationary member juxtaposed to said rotating member and having a receiving-chamber formed therein opposite to and between two of said circular series, said chamber having passage-ways arranged to receive the fluid from one series and project it against the next, and means for projecting a current of said fluid against the first series.

11. An elastic-fluid turbine comprising a rotating member having circular series of guiding-surfaces upon one face thereof adapted to receive and reflect a current of elastic motive fluid, a stationary member juxtaposed to said rotating member and having a receiving-chamber formed therein opposite to and between two of said circular series, said chamber having passage-ways arranged to receive the fluid from one series and project it against the next, means for separating said two series from each other to prevent the fluid from passing from one to the other except through said receiving-chamber thus causing different pressures to prevail in the respective series and enabling the expansion to take place by successive steps or stages.

12. A multiple-stage expansion-turbine comprising a discoid rotating member having circular series of guiding-surfaces upon one face thereof adapted to receive and reflect a current of elastic motive fluid, one or more expansion-nozzles arranged to direct a current of said fluid against the first of said series, a receiving-chamber opposite and between two of said series, passage-ways adapted to receive said fluid from one of said series and conduct it into said chamber, one or more expansion-nozzles leading from said chamber and directing said fluid against the other series, and packing means isolating the steam leaving the first nozzle or nozzles from the others, whereby the expansion takes place in successive stages.

13. An elastic-fluid impulse-turbine comprising a rotating discoid member having a plurality of sets of circularly-arranged guiding surfaces adapted to receive the motive fluid in a partially-tangential direction and reflect the same, absorbing a portion of its kinetic energy, stationary members juxtaposed to the respective sides and each having guiding-surfaces opposite to and between those on the rotating member and adapted to receive the steam from one set and deliver it to another set of said surfaces, one or more receiving-chambers opposite to and between another pair or pairs of said rotating sets of guide-surfaces, passage-ways adapted to receive said fluid from one set and deliver it to said receiving-chamber and expansion-nozzles adapted to project the steam from said receiving-chamber against the next set of said rotating guide-surfaces, expansion-nozzles adapted to deliver the fluid at initial pressure against the first set of said rotating guide-surfaces, and means for confining the fluid undergoing each stage of expansion.

14. An elastic-fluid turbine comprising a discoid rotating member having a plurality of circular series of crescent-shaped inclosed expanding passage-ways on one side thereof, each arranged to receive the motive fluid in a partially-tangential direction at the inner end and reflect it in a partially-tangential direction at the outer end, whereby said fluid has a radially-outward motion, and a circular series of impelling-nozzles on the casing adjacent and opposite to said rotating passage-ways and adapted to direct said fluid into the latter.

15. An elastic-fluid turbine comprising a discoid rotating member having a plurality of circular series of crescent-shaped hollows forming buckets on one side thereof, each arranged to receive the motive fluid in a partially-tangential direction at the inner end and reflect it in a partially-tangential direction at the outer end, whereby said fluid has a radially-outward motion, a circular series of tangentially axially positioned impelling-nozzles adjacent and opposite to said rotating buckets and adapted to direct said fluid against the latter, and a plurality of valves adapted to close independently the respective nozzles.

16. An elastic-fluid turbine comprising a discoid rotating member having a plurality of circular series of laterally-reëntrant buckets extending into one side thereof, each arranged to receive a motive fluid with respect to said buckets tangentially at the inner end which is at a certain distance from the center of said member, and to reflect it oppositely and parallel to the tangential direction of admission at the outer end of said bucket at a distance from the center greater than the inner end above mentioned, a circular series of impelling-nozzles respectively opposite to said rotating buckets and adapted to direct said fluid against the latter, a plurality of valves adapted to close independently the said nozzles respectively, and means for successively opening and closing said valves in accordance with variations of the load.

17. An elastic-fluid impulse-turbine comprising a rotating discoid member having several concentric series of crescent-shaped inclosed expanding passage-ways formed in the face thereof, the passage-ways of each series being adapted to receive the motive fluid in a tangential direction at their inner ends and reflect and discharge it backwardly at their outer ends, one or more stationary sets of similar inclosed expanding passage-ways in the casing arranged opposite and adjacent to and between the successive pairs of concentric series of rotating passage-ways and adapted to receive the fluid from one set and reflect and discharge it into the next set, the passage-ways of the several series being arranged in radial ranks, and means for projecting a current of said fluid into the passage-ways of the innermost series.

18. An elastic-fluid impulse-turbine comprising a rotating discoid member having several concentric series of buckets formed in the face thereof, the buckets of each series being adapted to receive the motive fluid in a partially-tangential direction at their inner ends and reflect and discharge it backwardly at their outer ends, one or more stationary sets of buckets arranged opposite and adjacent to and between the successive pairs of concentric series of rotating buckets and adapted to receive the fluid from one set and reflect and discharge it into the next set, and means for projecting a current of said fluid against the buckets of the innermost set, in conjunction with one or more annular receiving-chambers taking the place of some of said stationary sets of buckets and having passage-ways receiving the fluid from one set of rotating buckets and expansion-nozzles discharging it against the next outer set, and packing-rings interposed between said passage-ways and nozzles and isolating the several stages of expansion of said fluid.

19. In an elastic-fluid turbine, a disk-shaped wheel having buckets formed in its side, each comprising a segmental obliquely-disposed recess substantially semicircular in outline but having an oblique straight tangential portion at one end thereof.

20. In an elastic-fluid turbine, a disk-shaped wheel having buckets formed in its side, each comprising a segmental obliquely-disposed recess substantially semicircular in outline but having an oblique straight tangential portion at the entering end thereof.

21. In an elastic-fluid turbine, a disk-shaped wheel having buckets comprising segmental obliquely and radially disposed recesses formed in it, and a semicircular block arranged near the center of each said recess so as to close the central part thereof.

22. In an elastic-fluid turbine, a disk-shaped rotating member having a plurality of circularly-arranged buckets therein, said buckets being formed of oblique radially-set plates embedded in said member, the latter having an annular recess traversed by said plates, and semicircular oblique-faced blocks between said plates, closing the central part of the aperture of each bucket.

23. In an elastic-fluid turbine a disk-shaped rotating member having several concentric circular series of radially-disposed buckets, said buckets being formed by circular grooves or recesses in the side of said member and obliquely-set radially-disposed plates traversing said grooves and embedded in said member.

24. In an elastic-fluid turbine, a disk-shaped rotating member having several concentric circular series of radially-disposed buckets, said buckets being formed by circular grooves or recesses and obliquely-set radially-disposed plates each traversing all of said grooves and embedded in said member.

25. In an elastic-fluid turbine, the combination of a body-piece and a separately-formed bucket member, secured thereto and comprising a segmental circularly-recessed piece and radially-disposed plates set oblique to the surface and traversing the recess.

26. In an elastic-fluid turbine, buckets comprising a circularly-recessed piece, radially-disposed plates set oblique to the surface and traversing the recess, and a member or members closing the central portion of the aperture of said recess.

27. In an elastic-fluid turbine, a bucket formation comprising a cast-metal piece having obliquely-set radially-disposed plates cast thereinto and recesses formed between the adjacent plates, blocks interposed between the successive plates, and closing the central portion of the aperture of said buckets, and fastenings passing through the plates and blocks and securing the whole rigidly together.

28. An elastic-fluid turbine comprising a wheel having several circular series of buckets on each face, a casing surrounding said wheel and juxtaposed to the faces thereof and carrying likewise one or more concentric circular series of buckets, the latter being opposite to and between pairs of said buckets; an annular steam-chest formed in said casing; a ring of expansion-nozzles arranged to direct a current of motive fluid against the first series of wheel-buckets; ports connecting the nozzles individually with the steam-chest; individual valves adapted to close the respective ports annular receiving-chambers formed in said casing opposite to and between two adjacent series of wheel-buckets; a circular row of passage-ways adapted to conduct the fluid from the inner of said adjacent series to said receiving-chamber; a ring of secondary expansion-nozzles adapted to project the fluid in said chamber against the outer of said adjacent series; a ring of packing material between the casing and the wheel opposite said chamber and between said adjacent series of wheel-buckets; and an annular exhaust-chamber formed in said casing around the outer margin of said wheel.

29. In a multiple-expansion elastic-fluid turbine in conjunction with a wheel member, a construction for a receiving-chamber comprising a stationary member having an annular recess adjacent to the wheel, an annular block or segment closing the central part of the opening of said recess so as to leave passage-ways on each side thereof; and a series of transverse guide-plates forming partition across said chamber and passage-ways.

30. In a multiple-expansion elastic-fluid turbine in conjunction with a wheel member a construction for a receiving-chamber comprising a stationary member having an annular recess adjacent to the wheel, an annular block or segment closing the central part of the opening of said recess so as to leave passage-ways on each side thereof; and a series of transverse guide-plates cast in said block or segment and bent obliquely forward at the opening of said passage-ways, forming partitions across said chamber and passage-ways.

31. In an elastic-fluid turbine, a steam-packing between a stationary and rotating part comprising a ring of packing material set in a groove in one part, screws in said part adapted to thrust said ring forward against the other part, and other screws in the same part adapted to draw the ring back against said first-mentioned screws, whereby the ring is held rigidly in place in close juxtaposition to, but not necessarily in contact with the other part.

32. An elastic-fluid turbine, a rotating member a stationary member juxtaposed thereto, and having an annular groove, a packing-ring in said groove, screws at the back of said groove adapted to thrust said ring forward, and other screws at the back of said ring adapted to draw said ring back.

33. An elastic-fluid turbine comprising a wheel having an a surface on each side thereof, a casing juxtaposed thereto and having a circular ring of nozzles on each side of the wheel, a circular row of valves on each side governing the nozzles, a pair of regulating-rings governing the valves on the respective sides and means interconnecting the two regulating-rings, whereby they are caused to turn simultaneously, thereby opening the same number of valves on each side whereby end thrust due to unbalanced pressure is avoided.

34. An elastic-fluid turbine comprising a rotating disk and fixed envelop having inclosed guiding-passages on each, reëntrant obliquely to the plane of rotation, and so relatively located that the coördination of the passages presents a radially sinusoidal path for the fluid.

36. In an elastic-fluid turbine, rotating and fixed elements each having passages in concentric rows, and coördinated into sinusoidal paths which are respectively in planes oblique to the plane of rotation of said rotating element, and which extend radially outward from the center of rotation, the passages in succession from the center out being longer and longer radially, wider and wider circularly, and deeper and deeper obliquely to the plane of rotation.

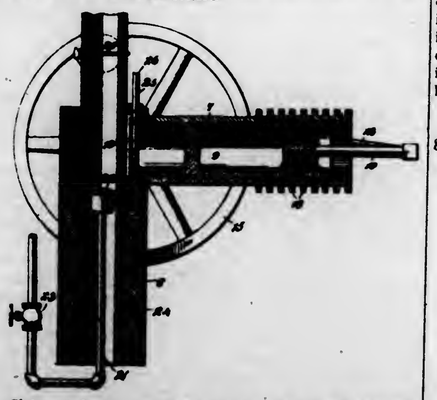
36. In an elastic-fluid turbine, the combination of a rotating member having concentric circular rows of inclosed passages reëntrant obliquely to the plane of rotation of the rotating member, each passage being adapted to guide the elastic fluid radially outward from the axis of rotation, and successively forward and backward with respect to the direction of rotation of said member, and a stationary member having concentric circular rows of ports, each port serving to guide the elastic fluid from the exhaust end of one of the passages first named in one circular row, to the admission end of one of the passages in the next row on the rotating member, the admission ends being nearer the axis of rotation than the exhaust ends, and the two ends of any passage being about radially in line with each other.

37. An elastic-fluid turbine, comprising a shaft, a disk thereon, whose axis is the axis of said shaft, and rows of reëntrant guiding inclosed passages for the fluid, at different distances from said axis, any one of said passages extending first inwardly from one side of said disk toward the other side thereof, and at the same time obliquely of both of said sides and of the axis of said disk, and secondly, toward the first-named side from the second-named side of said disk, and at the same time both obliquely of said axis and of said sides.

38. In an elastic-fluid turbine, a discoid rotating body having formed on one face thereof a plurality of circular series of reëntrant buckets, the buckets having their openings radially disposed and the buckets in the several series being disposed in radial ranks, the openings of a bucket in each series on one radial line; and means for directing a current of impelling fluid against the innermost series, receiving it therefrom and redirecting it against the next outer series, and so on to the outermost series.

39. In an elastic-fluid turbine, a discoid rotating body having formed on one face thereof a plurality of circular series of reëntrant buckets, the buckets having their openings radially disposed and the buckets in the several series being disposed in radial ranks, the openings of a bucket in each series on one radial line; an envelop having a face coöperating therewith and in juxtaposition thereto and having thereon similar circular series of reëntrant buckets, the latter being disposed likewise in radial ranks coinciding with those of said rotating body; and means for directing a current of impelling fluid against the innermost side of the innermost rotating buckets, which current is reflected back and forth passing radially outward to the outer ends of the outermost rotating buckets.

811,879. **HOT-AIR ENGINE.** FAIRIS N. SILVEY, Boaz, Ala. Filed May 19, 1905. Serial No. 261,194.



Claim.—1. In an engine of the class described, the combination with a working chamber and a motive-fluid chamber joined thereto and communicating therewith, of a piston operating in the working chamber, a displacer operating in the motive-fluid chamber, and means for heating the motive-fluid chamber at its juncture with the working chamber and creating a draft of air against certain of the walls of the motive-fluid chamber to cool the portions of the same that are separated from the working chamber.

2. In an engine of the class described, the combination with a working chamber and a motive-fluid chamber, of a piston operating in the working chamber, a displacer operating in the motive-fluid chamber, an open flue extending through the motive-fluid chamber and connected to opposing walls thereof, constituting a reinforcement for said walls and means for creating a draft through said flue to cool a portion thereof and of the chamber.

3. In an engine of the class described, the combination with a casing having a working chamber and motive-fluid chamber, of a piston operating in the working chamber, a displacer operating in the motive-fluid chamber, a flue extending through the motive-fluid chamber and connected to the opposing heads thereof, constituting a reinforcement therefor, and a heater located in the flue and heating a portion thereof to heat the motive-fluid chamber, said heater also creating a draft through a portion of the flue to cool the same.

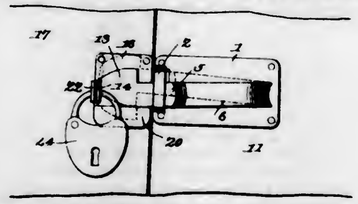
4. In an engine of the class described, the combination with a casing having a working chamber and a motive-fluid chamber communicating therewith, of a flue extending longitudinally through the motive-fluid chamber and connected to opposing walls, forming a reinforcement therefor, said flue having an inlet and an outlet, a piston operating in the working chamber, a displacer-body operating in the motive-fluid chamber and surrounding the flue, and a heater located in the flue contiguous to the juncture of the chambers.

5. In an engine of the class described, the combination with a casing having a working chamber and a motive-fluid chamber disposed in convergent relation, said chambers communicating at their points of convergence, a flue extending longitudinally through the motive-fluid chamber and constituting a reinforcement therefor, a heater in the flue heating a portion of the motive-fluid chamber and causing a draft of air to cool another portion, a working piston operating in the working chamber, a displacer operating in the motive-fluid chamber longitudinally of the flue, and means for effecting the operation of the displacer.

6. In an engine of the class described, the combination with a casing having a working chamber and a motive-fluid chamber disposed in convergent relation, the inner convergent ends of said chambers being in communication, a flue extending longitudinally through the motive-fluid chamber, a piston operating in the working chamber, a tubular displacer operating in the motive-fluid chamber and surrounding the flue, and a heater located in the flue contiguous to the juncture of the chambers and heating said juncture, said heater causing a draft of air through the outer portion of the flue to heat the corresponding portion of the motive-fluid chamber.

7. In an engine of the class described, the combination with a horizontally-disposed working cylinder, of a depending substantially upright motive-fluid cylinder having direct communication with the working cylinder at its upper end, a piston operating in the working cylinder, a flue extending longitudinally through the motive-fluid cylinder and connecting the ends thereof, a tubular displacer operating longitudinally in the motive-fluid cylinder and surrounding the flue, means for actuating the displacer, and a heater located in the flue, said heater heating the upper portion of the motive-fluid cylinder at the juncture thereof with the working cylinder and effecting a draft of air through the lower portion of the flue to cool the lower portion of said motive-fluid cylinder.

811,880. **LATCH.** JAMES O. STEENBLAND and WILLIAM WEAVER, Blanchardville, Wis. Filed Apr. 25, 1905. Serial No. 257,230.



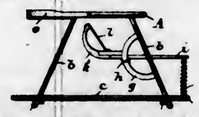
Claim.—1. A latch comprising an attaching-plate having a slot provided with corresponding inwardly-directed bearing projections, and a swinging latch having a flat pivot member passing through the slot and capable of rocking upon the bearing projections of said slot.

2. A latch comprising an attaching-plate having a slot provided with corresponding inwardly-directed projections, and a swinging latch having a flat pivot member passing through the slot and projected at the opposite side of the plate to form a handle for manipulating the latch, said pivot member engaging the projections of the slot as bearing-points.

3. In a latch, the combination of a swinging latch member provided with a catch-head having a laterally-directed perforate ear, a keeper including an attaching-plate and a laterally-directed flange provided with a seat to receive the catch-head, and a supplemental keeper provided at one end with a lateral perforate ear having a perforation, said supplemental keeper capable of being connected to the attaching-plate of the main keeper with its ear at either end thereof, the perforate ears of the supplemental keeper and the latch being adapted to receive the shackle of a lock.

4. In a latch, the combination of an attaching-plate having a transverse loop at one end thereof and provided at its opposite end with an opening, a swinging latch member having a handle upon its outer side and provided with a pivot member fitted in the opening of the plate, the free portion of the latch member working in the loop and provided at its extremity with an arrow-head catch having a laterally-directed ear provided with a perforation, a main keeper including an attaching-plate having a laterally-directed flange provided with an opening to receive the head of the latch and also provided with a downwardly-inclined guide-lip at the outer edge of the flange, and a reversible supplemental keeper capable of connection with the attaching-plate of the main keeper and provided with a laterally-directed ear having a perforation, the perforate ears of the supplemental keeper and the latch being adapted to receive the shackle of a lock.

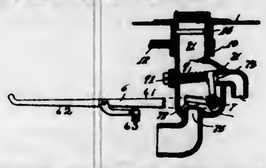
811,881. **BABY-TENDER.** GEORGE P. STEINBACH, Baltimore, Md. Filed Jan. 4, 1905. Serial No. 239,600.



Claim.—1. A baby-tender having in combination a stationary body-surrounding device; a seat having pivots or trunnions and supported to permit movement independently of said surrounding device and provided with an arm projecting rearward from the seat and also provided with a standard attached centrally to said seat and projecting forward therefrom; a strip of fabric having one end secured to the seat and the other secured to the said standard and unsupported between its ends; and means connected with said rear projecting arm to cause a yielding resistance when a child is on the seat.

2. The combination of a stationary body-surrounding device; a rigid seat, F, supported below said body-surrounding device to permit vertical movement independent thereof; a standard, *k*, attached to said rigid seat and projecting centrally therefrom forward and upward; and a strip of flexible fabric extending in an inclined position with respect to said rigid seat and free to yield or move independently of the seat, whereby when the front of the seat and said standard tilt downward the child which was resting on the rigid seat will slip forward from said seat and rest on said flexible inclined strip of fabric.

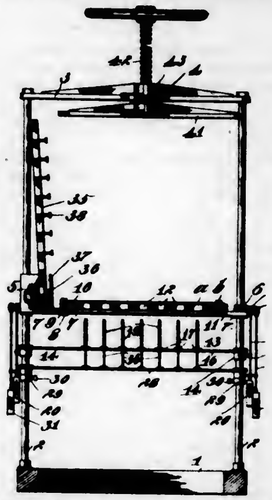
811,882. **WATER-CLOSET.** CHARLES A. SULLIVAN, Windsor, Canada. Filed Jan. 3, 1905. Serial No. 239,282.



Claim.—A connection between the flush-tank and a closet-bowl provided with valve-seats adapted to be alternately opened and closed by valves oscillating on a common center, a valve-shaft on said center and valve-carrying arms secured to said shaft, substantially as described.

811,883. **UPHOLSTERING APPARATUS.** MATHIAS TAUBER, Chicago, Ill., assignor of one-half to Edward Pokorny, Chicago, Ill. Filed June 21, 1905. Serial No. 266,264.

Claim.—1. An upholstering apparatus comprising means for piercing the backing material, and a movable frame carrying a plurality of tubes adapted to extend through the openings thus formed for keeping said openings clear of the stuffing material.



2. An upholstering apparatus comprising means for piercing the backing material, and means for keeping the openings thus formed clear of the stuffing material, said last-mentioned means comprising movably-supported tubes adapted to extend through said openings.

3. An upholstering apparatus comprising a supporting-framework, a frame slidably mounted in said framework and carrying a plurality of needles for piercing the backing material, and a second frame, also slidably mounted in said framework, carrying a plurality of tubes through which said needles are adapted to extend, said tubes being adapted to extend through the openings formed by said needles.

4. An upholstering apparatus comprising a perforated work-board for supporting the work, a plurality of tubes arranged to be moved through the perforations in said work-board and adapted to extend into the materials being operated upon, and a plurality of needles arranged to be moved into and out of said tubes.

5. An upholstering apparatus comprising a perforated work-board for supporting the work, and two independently-movable frames, one of said frames carrying a plurality of tubes adapted to be projected through the openings in said work-board, and the other frame carrying a plurality of needles each adapted to fit within one of said tubes.

6. An upholstering apparatus comprising a perforated work-board for supporting the work, a plurality of tubes adapted to be moved into and out of the openings in said work-board, and a plurality of needles adapted to be moved into and out of said tubes, the upper ends of said tubes being adapted to receive the shanks of the buttons and support the heads thereof.

7. An upholstering apparatus comprising a supporting-framework, a work-board pivotally mounted therein, a presser-board for forcing buttons through a portion of the materials being operated upon, which presser-board has a connection with said framework permitting a pivotal and a rectilineal movement of said presser-board, said presser-board carrying a plurality of pins each adapted to engage a button.

8. An upholstering apparatus having means for forcing buttons through a portion of the materials being operated upon, said means comprising a presser-board, pivot-pins for said presser-board, supporting members having elongated openings therein in which said pivot-pins are adapted to lie, and means for moving said presser-board bodily in a straight line.

9. In an upholstering apparatus, in combination, a work-board; means for piercing material laid on said work-board; tubes adapted to be projected through the openings thus formed for keeping the openings clear of the stuffing material; and means for forcing buttons through a portion of the materials being operated upon.

10. In an upholstering apparatus, in combination, a pivotally-mounted work-board; means for piercing material laid on said work-

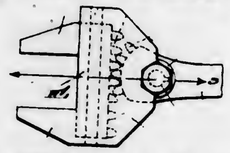
board; tubes adapted to project through the openings thus formed for keeping the openings clear of the stuffing material; and means comprising a pivotally-mounted presser-board for forcing buttons through a portion of the materials being operated upon.

811,884. SALICYLIC-ACID METHYLENE ACETATE AND PROCESS OF MAKING SAME. FRIEDRICH W. S. VALENTINER, Leipsic, Germany. Filed May 12, 1905. Serial No. 260,123. (Specimens.)

Claim.—1. The herein-described method of producing salicylic-acid methylene acetate consisting in reacting on acetyl salicylic acid with formaldehyde.

2. The new composition of matter having the formula $C_{16}H_{16}O_5$ constituting salicylic-acid methylene acetate, soluble in water and melting at 108°, as described.

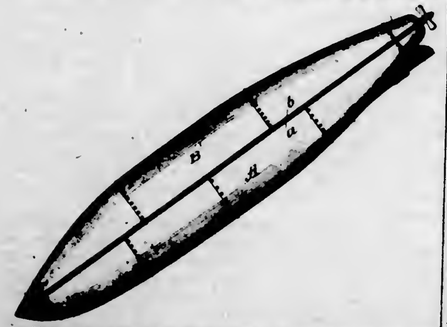
811,885. WRENCH. WILLIAM WEBB and WARNER W. HILBRETH, Gloversville, N. Y. Filed Oct. 11, 1905. Serial No. 282,355.



Claim.—1. A wrench comprising a handle with rack-teeth at the end thereof, a bolt mounted in an aperture in said handle, a lug projecting from said bolt and engaging an offset in the aperture of the handle, a pivotal jaw having shank portion with walls spaced apart and pivotally mounted upon said bolt, a laterally-movable jaw mounted between the parallel walls of the pivotal jaw and having rack-teeth engaging the teeth of said handle, a locking-lever having a threaded aperture and fitted over the threaded end of said bolt and designed to coöperate with the bolt and walls of the pivotal jaw to hold the laterally-movable jaw in an adjusted position, as set forth.

2. A wrench comprising a handle with rack-teeth at the end thereof, a bolt mounted in an aperture in said handle, a lug projecting from said bolt and engaging an offset in the aperture of the handle, a pivotal jaw having shank portion with walls spaced apart and pivotally-mounted upon said bolt, a laterally-movable jaw mounted between the parallel walls of the pivotal jaw and having rack-teeth engaging the teeth of said handle, a rib projecting from the inner face of one of the walls of the pivotal jaw and having a play in a recess formed in the shank portion of the laterally-movable jaw, a lever having a threaded aperture fitted over the threaded end of said bolt and adapted to coöperate with the bolt and walls of the pivotal jaw to hold the laterally-movable jaw in an adjusted position, as set forth.

811,886. CONSTRUCTION OF SUBMARINE BOATS. THOMAS H. WHELESS, New York, N. Y. Filed Nov. 3, 1903. Serial No. 179,745.



Claim.—1. A hull for submarine boats, consisting of two separate structures provided with flanges along the edges thereof, the said flanges being secured together to form a hull, with angle-irons secured in the fillets of said flanges, substantially as described.

2. In a hull for submarine boats, the combination with a lower flanged member, of an upper flanged member adapted to be secured to the lower, means for securing said flanges together, and longitudinal stiffeners for strengthening the fillets of said flanges, substantially as described.

3. In a hull for submarine boats, the combination with one member provided with a flange along the periphery thereof, of a second member provided with a similar flange registering with the first, means for securing said flanges together, whereby a complete hull is formed, and angle-irons secured in the fillets of said flanges, substantially as described.

4. A hull for submarine boats comprising bow and stern castings, flanged upper and lower members secured to said bow and stern castings and to each other, angle-irons secured in the fillets of said flanges, and framing mounted in said hull for stiffening the same, substantially as described.

5. A hull for submarine boats comprising bow and stern castings, flanged upper and lower members secured to said bow and stern castings and to each other, angle-irons secured in the fillets of said flanges, fore-and-aft beams connecting said bow and stern castings, and transverse ribs extending between said fore-and-aft beams, substantially as described.

6. A hull for submarine boats comprising bow and stern castings, flanged upper and lower members secured to said bow and stern castings and to each other, fore-and-aft beams projecting into sockets in the said bow and stern castings and connecting the same, and transverse ribs extending between the said fore-and-aft beams, substantially as described.

7. A hull for submarine boats, consisting of two separate structures each semi-elliptical in cross-section provided with flanges along the edges thereof, the said flanges being secured together to form a hull, with angle-irons secured in the fillets of said flanges, substantially as described.

8. A hull for submarine boats comprising bow and stern castings, flanged upper and lower members secured to said bow and stern castings and to each other, each member being semi-elliptical in cross-section, angle-irons secured in the fillets of said flanges, and framing mounted in said hull for stiffening the same, substantially as described.

9. A hull for submarine boats comprising bow and stern castings, flanged upper and lower members secured to said bow and stern castings and to each other, angle-irons secured in the fillets of said flanges, each member being semi-elliptical in cross-section, fore-and-aft beams connecting said bow and stern castings, and transverse ribs extending between said fore-and-aft beams, substantially as described.

10. A hull for submarine boats comprising bow and stern castings, flanged upper and lower members secured to said bow and stern castings and to each other, each member being semi-elliptical in cross-section, fore-and-aft beams projecting into sockets in the said bow and stern castings and connecting the same, and transverse ribs extending between said fore-and-aft beams, substantially as described.

11. A hull for submarine boats comprising bow and stern castings, flanged upper and lower members secured to said bow and stern castings and to each other, and fore-and-aft side beams connecting said bow and stern castings, and forming a lap-joint with said flanges, substantially as described.

12. A hull for submarine boats comprising bow and stern castings, flanged upper and lower members secured to said bow and stern castings and to each other, fore-and-aft side beams projecting into sockets in the said bow and stern castings and connecting the same, and forming a lap-joint with said flanges, and transverse ribs extending between the said fore-and-aft beams, substantially as described.

13. In a hull for submarine boats, the combination with a lower flanged member, of an upper flanged member adapted to be secured to the lower angle-irons mounted in the fillets of said flanges and bolts securing said angle-irons and flanges together, substantially as described.

811,887. HIGH-SPEED MOTOR-BOAT. THOMAS H. WHELESS, New York, N. Y. Filed Jan. 5, 1905. Serial No. 239,785.

Claim.—1. A high-speed motor-boat having fine lines below the water-line, with the bow deeper than the stern, and having buoyancy-chambers provided at each side above the water-line and tapering upward and outward, and being provided with a weighted keel, substantially as described.

2. A high-speed motor-boat having fine lines below the water-line with the bow deeper than the stern, and having buoyancy-chambers provided at each side above the water-line and tapering upward and outward, and being provided with a hollow keel weighted at its base and opening upward into the boat, substantially as described.

3. A high-speed motor-boat, provided with fine lines below the water-line, with the bow deeper than the stern, buoyancy-chambers arranged above the water-line and at each side of the boat, and a deep weighted keel tapering upward from the center toward the bow and stern, substantially as described.

4. A high-speed motor-boat, provided with fine lines below the water-line, with the bow deeper than the stern, buoyancy-chambers arranged above the water-line and at each side of the boat, and a deep hollow weighted keel tapering upward from the center toward the bow and stern, substantially as described.

5. A high-speed motor-boat having fine lines below the water-line and having buoyancy-chambers provided at each side above the water-line and tapering upward and outward and also being inclined downward from the bow aft, and being provided with a weighted keel, substantially as described.

6. A high-speed motor-boat having fine lines below the water-line and having buoyancy-chambers provided at each side above the water-line and tapering upward and outward and also being inclined downward from the bow aft, and being provided with a hollow keel weighted at its base and opening upward into the boat, substantially as described.

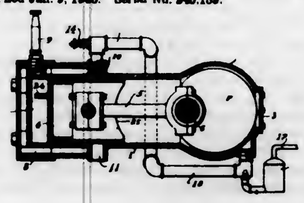
7. A high-speed motor-boat having fine lines below the water-line, with the bow deeper than the stern, and having buoyancy-chambers provided at each side above the water-line and tapering upward and outward and also being inclined downward from the bow aft, and being provided with a weighted keel, substantially as described.

8. A high-speed motor-boat having fine lines below the water-line, with the bow deeper than the stern, and having buoyancy-chambers provided at each side above the water-line and tapering upward and outward and also being inclined downward from the bow aft, and being provided with a hollow keel weighted at its base and opening upward into the boat, substantially as described.

9. A high-speed motor-boat, provided with fine lines below the water-line, with the bow deeper than the stern, buoyancy-chambers arranged above the water-line and at each side of the boat, and tapering from the center toward each end of the boat, and a deep weighted keel tapering upward from the center toward the bow and stern, substantially as described.

10. A high-speed motor-boat, provided with fine lines below the water-line, with the bow deeper than the stern, buoyancy-chambers arranged above the water-line and at each side of the boat, and tapering from the center toward each end of the boat, and a deep hollow weighted keel tapering upward from the center toward the bow and stern, substantially as described.

811,888. EXPLOSIVE-ENGINE. JOSEPH A. WILLIAMS, Cleveland, Ohio. Filed Jan. 9, 1905. Serial No. 240,139.



Claim.—1. In an explosive-engine, a cylinder, a compression-chamber, a conductor for the explosive mixture connecting the said cylinder and chamber, a valve located in said conductor near the intake opening into the cylinder through which air is admitted into the conductor and compression-chamber, a device independent of said valve for supplying fuel communicating with the conductor beyond the valve from the cylinder, whereby when air is drawn through the valve and conductor into the chamber it will become carbonized as it passes the said device, and when the mixture is admitted to the cylinder it will be preceded by air which has not been so carbonized for the purpose of expelling the exploded gases from the cylinder.

2. In an explosive-engine, a cylinder, a compression-chamber for the explosive mixture, a pipe connecting the cylinder and said chamber, a valve for admitting air to the pipe, said valve being connected to the pipe near the cylinder intake-opening, and a fuel-supply connected to said pipe immediately adjacent the compression-chamber, whereby a column of air is provided in the pipe between the fuel-supply and the cylinder for scavenging the cylinder in advance of the entrance of the explosive mixture.

3. In an explosive-engine, a cylinder, a compression-chamber for the explosive mixture, a pipe connecting the said cylinder and chamber, an inwardly-opening check-valve for air connected with said pipe near the cylinder intake-opening, and a device for supplying fuel connected with said pipe immediately adjacent to the compression-chamber, the construction and arrangement being such that when air is drawn through the valve and pipe into the said chamber it will be carbonized as it passes the fuel-supply but the air between the said fuel-supply and the cylinder will not be carbonized, and when communication is opened between the pipe and the cylinder the said uncarbonized air will first enter the cylinder and expel the exploded gases before the explosive mixture is admitted.

4. In an explosive-engine, a cylinder, a closed crank-chamber connected with the front end of the cylinder and chamber, a pipe leading from said cylinder to the chamber and communicating with both of the same, a valve opening into said pipe near the cylinder intake-opening, through which valve the air is admitted into the pipe and crank-chamber, and a device for supplying fuel communicating with the pipe immediately adjacent to its entrance into the crank-chamber, the arrangement and construction being such that when air is admitted to the crank-chamber it will be carbonized as it passes over the fuel-supply, and when the mixed gases are admitted to the cylinder they will be preceded by a column of air confined in the pipe near the cylinder to expel the exploded gases therefrom.

5. In an explosive-engine, a cylinder, a compression-chamber for the explosive mixture, a conductor for the mixture connecting the said cylinder and chamber, a valve near the inlet of said cylinder for admitting air to the conductor, means at the opposite end of said conductor immediately adjacent to the compression-chamber for admitting a fuel-supply thereto, said means being entirely independent of the air-valve, the arrangement of the cylinder, the compression-chamber, the conductor the valve and said means being such that a blast of air will be admitted to the cylinder in advance of the explosive mixture for the purpose of expelling the exploded gases therefrom.

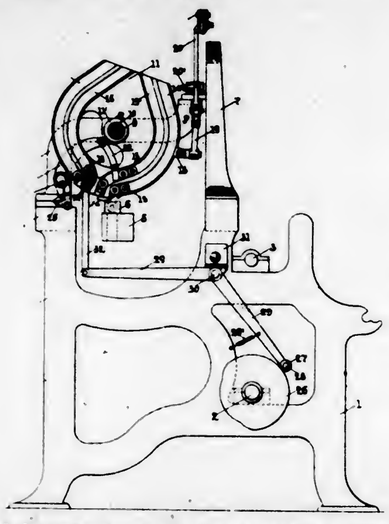
6. In an explosive-engine, a cylinder, a crank-chamber within which the explosive mixture is compressed, a crank within said chamber, a piston within the cylinder, the forward end of which is adapted to enter the crank-chamber, said end of the piston being concaved in shape so as to accommodate the movement of the crank, a conductor connecting the crank-chamber with the cylinder, a valve for admitting air to said conductor near its inlet to the cylinder, and means independent of the said valve for supplying fuel to the conductor immediately adjacent to the crank-chamber, for the purpose specified.

811,889. WEFT-REPLENISHING LOOM. HORACE WYMAN and JOSEPH T. CYR, Worcester, Mass., assignors to Crompton & Knowles Loom Works, a Corporation of Massachusetts. Filed May 8, 1905. Serial No. 259,380.

Claim.—1. In a weft-replenishing loom, a magazine comprising two sets of compartments or guideways, an outer set, and an inner overlaying set, the terminals of the inner set interposed between the terminals of the outer set, and the terminals of the inner set being turned downward at an angle to the main portion of the compartment or guideway.

2. In a weft-replenishing loom, a pivoted magazine having two sets of guideways or compartments for filling-carriers, each set having two guideways or compartments, and the inner set overlaying the outer set, with its two terminals interposed between the two termi-

nals of the outer set, and all four terminals substantially the same distance from the axis of the magazine.



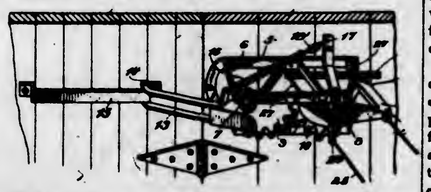
3. In a weft-replenishing loom, a magazine having a compartment or guideway carrying a series of filling-carriers overlaying a series of filling-carriers in another compartment or guideway, and said compartment or guideway, and each compartment or guideway having a terminal adapted to be placed under a transferrer, and means to move the filling-carriers of the overlaying series, which cover the terminal of the outer compartment or guideway, to admit free access of the transferrer to the terminal of said outer guideway.

4. In a weft-replenishing loom, a magazine comprising two sets of compartments or guideways for filling-carriers, one of the two sets comprising two outer compartments, one on each side of the transferrer, and the other of the two sets comprising two inner compartments, one on each side of the transferrer, the filling-carriers of the inner set overlaying the filling-carriers of the outer set, and each compartment having a terminal position for the lowest filling-carrier in each compartment.

5. In a weft-replenishing loom, a magazine comprising four compartments or guideways for four series of superposed filling-carriers, each compartment having a terminal for its lowest filling-carrier, and the magazine adapted to be moved to place either one of the terminals under the transferrer.

6. In a weft-replenishing loom, a magazine carrying bobbins or filling-carriers, a transferrer for the filling-carriers, normally positioned above a filling-carrier, and means to communicate an upward movement to the transferrer, to raise it above its normal position, and permit a retained filling-carrier to pass under it.

811,890. **DOOR OPENER AND CLOSER FOR MINES.** FRANK KOEHLER, Fryburg, Pa. Filed Sept. 16, 1905. Serial No. 278,733.



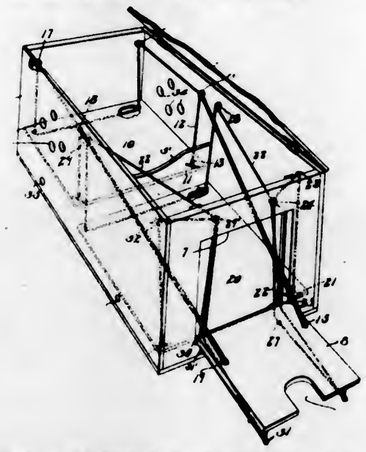
Claim.—1. In a device for opening and closing gates, the combination of a bracket, a segment carried thereby and provided with means for connection with a gate, a second segment carried by said bracket and arranged to mesh with said first-mentioned segment and provided with suitable connecting wires, cables or rods to operate the same, and a spring connected to said first-mentioned segment to assist in opening and closing the gate, substantially as described.

2. In a device for opening and closing gates, the combination of two pivoted members arranged to mesh with each other, one of said members being provided with means for connection with a gate, the other of said pivoted members being provided with a suitable connecting wire, cable or rod, and a spring connected to the first-mentioned member to assist in opening and closing the gate, substantially as described.

3. In a device for opening and closing gates, the combination of two pivoted members provided with teeth and arranged to mesh with each other, means for connecting one of said members to a gate, the other of said members being provided with a connecting wire, cable or rod, a spring connected to said first-mentioned member to assist in opening and closing the gate, and means remote from said pivoted members for operating the same, substantially as described.

4. In a device for opening and closing gates, the combination of two pivoted toothed members arranged to mesh with each other, one of said members being provided with means for connection with a gate, the other of said pivoted members being provided with a connecting wire, cable or rod, and an operating device remote from said members arranged to operate the same through the medium of said wire, cable or rod, substantially as described.

811,891. **AUTOMATIC HEN'S NEST.** ALFRED J. ADSHEER, Diehlstadt, Mo. Filed June 13, 1905. Serial No. 265,106.



Claim.—1. In a device of the class described, a casing provided with a pivoted door having an opening formed in its free end, a nest-supporting platform arranged within the casing and adapted to close the door when the platform is depressed, and an actuating-platform operatively connected with the door for opening the latter and simultaneously elevating the nest-supporting platform.

2. In a device of the class described, a casing provided with a movable door, a vertically-movable nest-supporting platform, arranged within the casing and adapted to close the door when the platform is depressed, and an actuating-platform operatively connected with the door for opening the latter and simultaneously elevating the nest supporting the platform; there being an opening formed in the walls of the casing below said platforms to permit the escape of air.

3. In a device of the class described, a casing having a pivoted door the free end of which is provided with an opening, a partition extending transversely of the casing and dividing the latter into a plurality of communicating compartments, a nest-supporting platform mounted for vertical movement in one of the compartments and adapted to close the door when said platform is depressed, and an actuating-platform mounted for vertical movement in the opposite compartment and operatively connected to the door for opening the latter and simultaneously elevating the nest-supporting platform.

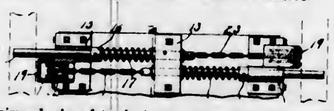
4. In a device of the class described, a casing provided with a pivoted door, a nest-supporting platform mounted for vertical movement within the casing, a flexible connection between the platform and the inner face of the door for closing the latter when the platform is depressed, an actuating-platform coacting with the nest-supporting platform and movable simultaneously in the opposite direction, and a flexible connection between the actuating-platform and the outer face of the door for opening the latter.

5. In a device of the class described, a casing provided with a pivoted door having an opening in its free edge, brackets secured to the door on each side of the opening and adapted to support the door when in lowered position, a nest-supporting platform arranged within the casing and adapted to close the door when the platform is depressed, an actuating-platform mounted for vertical movement within the casing, and a flexible connection between the actuating-platform and the brackets for opening the door.

6. In a device of the class described, a casing having a pivoted door, a partition extending transversely of the casing and dividing the latter into a plurality of communicating compartments, guiding devices secured to the side walls of the casing, a nest-supporting platform mounted for vertical movement in one of the compartments, a flexible medium extending across the bottom of the platform and passing through the guiding devices for connection with the inner face of the door for closing the latter, an actuating-platform disposed within the opposite compartment, and a flexible connection between the actuating-platform and the outer face of the door for opening said door.

7. In a device of the class described, a casing provided with a downwardly-swinging pivoted door having an opening formed in its free end, brackets secured to the door, a partition extending transversely of the casing and dividing the latter into a plurality of communicating compartments, a nest-supporting platform mounted for vertical movement in one of the compartments, a flexible connection between the platform and the inner face of the door for closing the latter, an actuating-platform mounted within the opposite compartment, and a flexible medium secured to the actuating-platform and extending beneath the pivoted edge of the door for engagement with the brackets whereby the downward movement of the actuating-platform will automatically open the door.

811,892. **SAFETY DEVICE FOR MINE-ELEVATORS.** ISAAC M. ADAMS, Shenandoah, Pa., assignor of one-half to William Stein, Shenandoah, Pa. Filed Sept. 18, 1905. Serial No. 278,961.



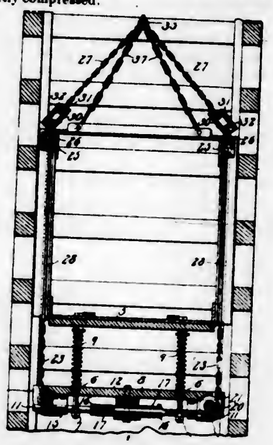
Claim.—1. A safety device for mine-elevators, comprising a pair of spring-projected bolts arranged in parallel relation at the bottom of the cage, each bolt extending inward from the side of the cage to a point beyond the median line thereof, a guide-block arranged at the central portion of the bottom of the cage and having openings for the passage of said bolts, guide-blocks arranged at the outer edges of the cage-platform for the passage of the bolts, said blocks being also arranged to form shaft-supports, chain-guides, shafts having bearings in said blocks, sheaves mounted on the shafts, chains extending around said sheaves and connected to the bolts, said chains being connected to the hoisting-cable and tending to hold the bolts retracted while the cable remains intact.

2. A safety device for mine-elevators, comprising a plurality of locking-bolts arranged in pairs, each pair of bolts extending from the side of the car to a point beyond the median line thereof, a guide-block arranged at the center of the cage, and having openings for the reception of said bolts, auxiliary blocks arranged at the sides of the car for the reception of the bolts, means for projecting said bolts, chains extending from the bolts, connecting-bars coupled to said chains, and auxiliary chains extending from the upper ends of said bars to the hoisting-ring.

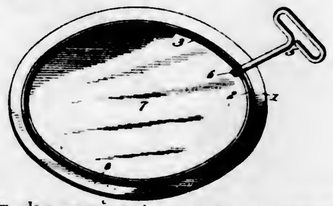
811,893. **SAFETY DEVICE FOR MINE-CAGES.** ISAAC M. ADAMS, Shenandoah, Pa., assignor of one-half to William Stein, Shenandoah, Pa. Filed Sept. 26, 1905. Serial No. 280,697.

Claim.—1. In a safety device for mine-cages, a supporting-bar arranged below the floor of the cage, springs tending to depress said bar, spring-projected locking-bolts carried by the bar and arranged when projected to engage the horizontal sills of the shaft-timbering, and bolt-retracting connections between the bolts and the hoisting-cable, said members being placed under sufficient stress to retract the bolts and slightly elevate the carrying-bar, the cushioning-springs of the latter serving as compensating means for the bolts.

2. In a safety device for mine-cages, a plurality of bolts depending from the floor of the cage, a bar or plate slidably mounted on said bolts, stops arranged at the lower ends of the bolts for limiting downward movement of the plate, springs surrounding the bolts and tending to maintain the plate in its lowest position, spring-projected bolts supported by said plate, and flexible connections extending between said bolts and the hoisting-cable, said connections being placed under sufficient stress to retain the bolts retracted and the cushioning-springs slightly compressed.



811,894. **CAN-OPENER.** LOUIS ALDEN, Jr., Bryn Mawr, Pa. Filed July 10, 1905. Serial No. 268,899.



Claim.—In a can-opener, the combination of a receptacle provided with a V-shaped groove stamped in it, the metal being severed at intervals at the apex of the groove to form integral connecting portions, and a severing or unsealing wire soldered in the groove and fitting against the walls thereof and spaced from the apex of the groove and from the walls of the mouth of the same to provide solder-receiving-spaces.

811,895. **CROSS-ARM CONSTRUCTION FOR TELEGRAPH-POLES, &c.** OLIVER C. ALLEN, Greenfield, Ind. Filed May 17, 1905. Serial No. 260,763.

Claim.—1. The combination with a telegraph-pole and the like, of a pair of parallel cross-arms centrally secured thereto, one on each side of the pole, and a clamping means secured to the extreme ends of the cross-arms on each side of the pole for bracing them together, substantially as set forth.

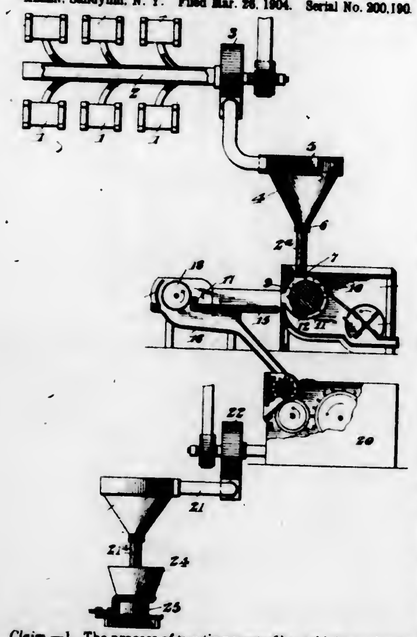
2. The combination with double cross-arms on telegraph-poles and the like, of means for bracing the ends of said cross-arms consisting of a horizontal rod, and means on each end of said rod adapted to be clamped to the ends of the cross-arms.

3. The combination with double cross-arms on telegraph-poles

and the like, of means for bracing the ends of said cross-arms which consists of a threaded horizontal rod, a pair of bracing-clamps on each end thereof, and nuts on said rod at each side of said bracing-clamps for clamping them on the cross-arms.

4. The combination with double cross-arms on telegraph-poles and the like, of means for bracing the ends of said cross-arms which consists of a horizontal threaded rod, a pair of bracing-clamps on each end thereof, the members of said clamps having inturned heels that abut against each other, toe-pieces adapted to penetrate the cross-arms, and nuts on said rod for tightening and holding said bracing-clamps in engagement with the cross-arms.

811,896. **PROCESS OF TREATING WASTE FIBER.** URIAH C. ALLEN, Sandyhill, N. Y. Filed Mar. 26, 1904. Serial No. 200,190.



Claim.—1. The process of treating waste fiber which consists in first subjecting it to the action of a gyrating current of air to remove the dust, and thereafter disintegrating the fibrous mass and separating the trash therefrom.

2. The process of treating waste fiber which consists in first subjecting it to a gyrating current of air to remove the dust, next separating the small particles of trash, and finally separating the large pieces of trash from the fiber.

3. The process of treating waste fiber which consists in first subjecting it to a gyrating current of air to remove the dust, next separating the small particles of trash, next separating the large pieces of trash from the fiber, and finally again subjecting the fiber to the action of a current of air to remove the dust remaining.

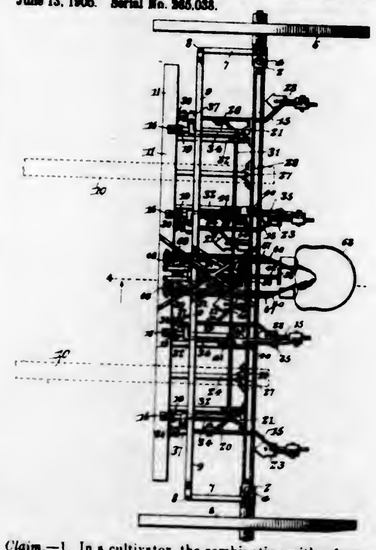
4. That process of treating mote-cotton which consists in first subjecting it to the action of a gyrating current of air to remove the dust, next separating the small particles of trash by suction, and thereafter disintegrating the fibrous mass and separating the large pieces of trash therefrom.

5. The process of treating mote-cotton which consists in first subjecting it to a gyrating current of air to remove the dust, next removing the small particles of trash by suction, and thereafter rotating the fibrous mass at high speed to separate the large pieces of trash by centrifugal force.

6. That process of treating mote-cotton which consists in first subjecting it to the action of a gyrating current of air to remove the dust, next separating the small particles of trash by suction, next rotating the fibrous mass at high speed to separate the large pieces of trash by centrifugal force, and thereafter separating the motes from the cotton.

7. That process of treating mote-cotton which consists in subjecting it to the action of a gyrating current of air to remove the dust, next removing the small particles of trash by suction, next separating the large pieces of trash by centrifugal force, next separating the motes from the cotton, and finally again subjecting the cotton to the action of a gyrating current of air to remove any dust remaining.

811,897. **CULTIVATOR.** SILAS E. BAILOR, Tarkio, Mo. Filed June 13, 1905. Serial No. 265,038.



Claim.—1. In a cultivator, the combination with a frame, of an arch, cultivating devices connected with the arch, and flexible connections between the frame and the arch for supporting the latter, said flexible connections extending along the sides of the arch.

2. In a cultivator, the combination with a frame, of a plurality of arches, separate gangs of cultivating devices mounted on the arches, substantially vertical links depending from the frame for movably suspending the arches from the frame, and means for adjusting the arches.

3. In a cultivator, the combination with a frame, of a plurality of arches, substantially vertical spaced link connections movably suspending the arches from the frame, gangs of cultivating devices mounted on the arches, and means for adjusting the arches.

4. In a cultivator, the combination with a frame, of a plurality of arches movably connected with the frame, gangs of cultivating devices mounted on the arches, and mechanism carried by the frame for adjusting the gangs of cultivating devices.

5. In a cultivator, the combination with a frame, of a plurality of arches movably connected with the frame, gangs of cultivating devices mounted on the arches, and mechanism for adjusting the gangs of cultivating devices independently of each other, said mechanism being carried by the arches in the movement thereof.

6. In a cultivator, the combination of a frame, an arch movably connected therewith, cultivating devices connected with the arch and arranged to swing upward and downward, adjusting mechanism for raising and lowering the cultivating devices, and supporting means rigid with the arch and having the adjusting mechanism mounted on it.

7. In a cultivator, the combination of a frame, an arch movably suspended therefrom, cultivating devices pivotally connected with the arch and adapted to swing upward and downward, arms rigid with and extending from the arch, and adjusting mechanism supported by the arms and connected with the cultivating devices for raising and lowering the same.

8. In a cultivator, the combination with a frame, of an arch movably suspended from the frame and provided with rigid projecting arms, cultivating devices pivotally connected with the arch, a rock-shaft mounted on the projecting arms and having a depending arm, an operating-lever also mounted on the rock-shaft and forming a depending arm, and means for connecting the said depending arms with the cultivating devices.

9. In a cultivator, the combination with a frame, of an arch, substantially vertical links depending from the frame and connected with the arch, cultivating devices connected with the arch, and independent bracing means pivotally connected with the arch and with the frame for permitting the said arch to move laterally of the cultivator.

10. In a cultivator, the combination of a frame, an arch, links depending from the frame and connected with the arch at opposite sides thereof, and braces extending rearwardly from the lower portions of the sides of the arch and pivotally connected with the same and with the frame.

11. In a cultivator, the combination with a frame, of an arch movably suspended from the frame, cultivating devices connected with the arch, and inclined braces pivotally connected with the sides of the arch and with the frame.

12. In a cultivator, the combination with a frame, of an arch movably suspended from the frame, cultivating devices connected with the arch, and a horizontal brace pivotally connected with the arch and with the frame.

13. In a cultivator, the combination with a frame, of an arch movably suspended from the frame, cultivating devices connected with the arch, and horizontal and inclined braces pivotally connected with the arch and with the frame and maintaining the former in an upright position.

14. In a cultivator, the combination with a frame, of separate gangs of cultivating devices, an operating rock-shaft, and means for connecting the rock-shaft with the gangs of cultivating devices, whereby the said gangs are moved toward and from each other when the rock-shaft is rotated.

15. In a cultivator, the combination with a frame, of separate gangs of cultivating devices, an operating rock-shaft, means for connecting the rock-shaft with the gangs of cultivating devices, whereby the said gangs are moved toward and from each other when the rock-shaft is rotated, and means for locking the rock-shaft against rotation.

16. In a cultivator, the combination with a frame, of separate gangs of cultivating devices, an operating-shaft located between the gangs of cultivating devices and provided with opposite arms, means for connecting the arms with the cultivating devices, and means for locking the shaft against rotation for securing the gangs of cultivating devices in their adjustment.

17. In a cultivator, the combination with a frame, of separate gangs of cultivating devices, a shaft connected with the cultivating devices and provided with a head, and a bearing or socket receiving the head, said head and socket being provided with means for interlocking them with each other, whereby the shaft is held against rotation.

18. In a cultivator, the combination with a frame, of separate gangs of cultivating devices, a shaft connected with the cultivating devices and provided with a head, a bearing or socket receiving the head, said head and socket being provided with means for interlocking them with each other whereby the shaft is held against rotation, and a spring for maintaining the head and the socket in their interlocked relation.

19. In a cultivator, the combination with a frame, of a plurality of cultivating devices, and a shaft connected with the cultivating devices, said shaft being mounted for rotation for moving the cultivating devices toward and from each other and being also capable of oscillation for moving the cultivating devices simultaneously in the same direction.

20. In a cultivator, the combination with a frame, and pivotally-mounted axles, of shiftable connecting means for the axles, cultivating devices, and a rock-shaft connected with the cultivating devices and arranged to engage the shiftable connection for moving the cultivating devices and shiftable connection simultaneously.

21. In a cultivator, the combination with a frame, of pivotally-mounted axles, a shiftable connection for the axles, cultivating devices, operating mechanism for the cultivating devices, and a fastening device for detachably securing the operating device to the shiftable connection

22. In a cultivator, the combination with a frame, of pivotally-mounted axles, a shiftable connection for the axles, cultivating devices, operating mechanism for the cultivating devices, an arm extending from the shiftable connection and having a recess or opening to receive the operating mechanism, and a movable locking device for securing the operating mechanism in the recess or opening of the said arm.

23. In a cultivator, the combination with a frame, of cultivating devices, a shaft connected with the cultivating devices, pivotally-mounted axles, a shiftable connection for the axles having an arm, and a ratchet mounted on the frame for holding the shaft, said shaft being arranged to engage either the ratchet or the arm.

24. In a cultivator, the combination with a frame, of pivotally-mounted axles, a shiftable connection for the axles having an arm, cultivating devices, a bracket mounted on the frame and having a bearing, a shaft mounted in the bearing and connected with the cultivating devices and arranged to engage the said arm, mechanism also mounted on the bracket and secured to the shiftable connection for actuating the same, and treadles connected with the said mechanism for enabling the shiftable connection to be controlled by the feet of the operator.

25. In a cultivator, the combination with a frame, of an arch, cultivating devices connected with the arch, and links forming flexible connection between the frame and the arch for supporting the latter, said links extending along the sides of the arch.

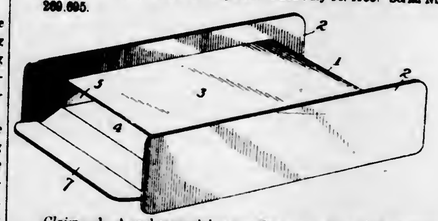
26. In a cultivator, the combination with a frame, of an arch provided at the lower ends of its sides with laterally-extending pivots, cultivating devices connected with the pivots of the arch, and flexible connections extending from the frame to the said pivots for supporting the arch.

27. In a cultivator, the combination with a frame, of an arch, cultivating devices connected with the arch, flexible connections between the frame and the top of the arch, and separate flexible connections between the frame and the bottom of the arch.

28. In a cultivator, the combination with a frame, of an arch, cultivating devices connected with the arch, links connecting the top of the arch with the frame, and separate links depending from the frame and connected with the bottom of the arch for supporting the latter.

29. In a cultivator, the combination with a frame, of an arch, flexible connections depending from the frame and connected with the bottom of the arch for supporting the latter, and horizontal and inclined links connected with the frame and with the top and bottom of the arch respectively for maintaining the latter in an upright position.

811,898. **COLLAPSIBLE REEL.** AARON BILLSTEIN, Baltimore, Md., assignor to The Friedenwald Company of Baltimore City, Baltimore, Md., a Corporation of Maryland. Filed July 14, 1905. Serial No. 269,695.



Claim.—1. A reel comprising two flange members and an intermediate transverse member, the said reel being adapted to be erected and collapsed without disconnecting its members.

2. A reel comprising two flange members and an intermediate box member to the sides of which the flange members are connected, the said reel being collapsible without disconnecting the flange members from the box member.

3. A reel comprising two flange members and an intermediate folding box to which the flange members are permanently connected, the said box being collapsible, for the purpose set forth.

4. A reel comprising a rectangular folding box having a tubular body and end flaps adapted to inclose the space within the box, and two flange members permanently connected to opposite sides of the box, the said box and flange members being collapsible to bring all of the members thereof substantially into the same plane, for the purpose set forth.

811,899. **COLLAPSIBLE REEL.** AARON BILLSTEIN, Baltimore, Md., assignor to The Friedenwald Company of Baltimore City, Baltimore, Md., a Corporation of Maryland. Filed July 14, 1905. Serial No. 269,696.

Claim.—1. A collapsible reel comprising two side plates or flanges and a plurality of transverse collapsible tubular members connected at their ends to said plates or flanges.

2. A collapsible reel comprising two side plates or flanges and a plurality of transverse collapsible tubular members, said flanges and tubular members being constructed to interlock.

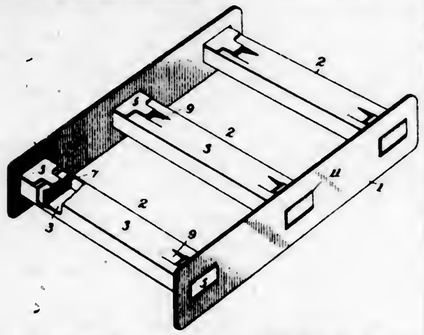
3. A collapsible reel comprising a pair of flange members each having two slots therein and a tubular connecting member having at

an expanding portion carried by the mouthpiece for expanding the flexible portion against said flange, substantially as described.

means operated by the lateral swing of the trolley-pole for operating

prising a disk which rotates with the winding-rollers, a spring-pressed

3. A collapsible reel comprising a pair of flange members each having two slots therein and a tubular connecting member having at each end a flap passing through said slots, said flap having its end connected to said tubular member.



4. A collapsible reel comprising two flange-sections, each section being provided with two slots, in combination with a tubular transverse member having at each end a flap adapted to pass out through one slot in a flange member and in through the other slot therein, and said flap having at its free end ears which engage an opening in the body of the tubular member.

5. A collapsible reel comprising two flange members provided with pairs of parallel slots and a transverse member consisting of a collapsible tube provided at its ends with tongues for interlocking with the slots in the flange members and with means for locking the said tongues in engagement with the flange members.

6. In a collapsible reel comprising a pair of flange members and a plurality of tubular collapsible transverse members, said tubular members having flaps adapted to interlock with the flange members.

7. A collapsible reel comprising flange members and transverse tubular members having openings therein adapted to receive the finger of an operator, flaps on the ends of said tubular members adapted to interlock with the flange members, and adapted to be pushed through the openings by the finger of the operator and having ears to interlock with the said tubular member.

8. In a collapsible reel, a collapsible tubular member having the end flaps 5 and 10 at each end whereby the ends may be closed and rendered secure and having the slits 8 forming enlarged openings near the ends adapted to receive the ends of the flaps 5, said flaps having the ears 7 adapted to interlock with the slits 8 for the purpose set forth.

9. A reel comprising two side plates or flanges, each having a plurality of pairs of slots therein, and a plurality of tubular transverse members each adapted to be securely interlocked at its ends with the flange members, said tubular members being collapsible, for the purpose set forth.

811,900. **FOLDING PHONOGRAPH-HORN.** JAMES T. BROWN, New York, N. Y. Filed Dec. 31, 1904. Serial No. 239,941.

Claim.—1. A horn comprising a mouthpiece, a flexible portion, and coöperating means on said mouthpiece and flexible portion for expanding the latter and clamping it in expanded position, substantially as described.

2. A horn comprising a mouthpiece, a flexible portion, and cooperating tapered means on said mouthpiece and flexible portion for expanding the latter and clamping it in expanded position, substantially as described.

3. A horn comprising a mouthpiece, a flexible portion, coöperating tapered means on said mouthpiece and flexible portion for expanding the latter and clamping it in expanded position, and means for locking said flexible portion on the mouthpiece in expanded position, substantially as described.

4. A horn comprising a mouthpiece, a flexible portion, an annular flange carried by the flexible portion for limiting its expansion, and an expanding portion carried by the mouthpiece for expanding the flexible portion against said flange, substantially as described.

5. A horn comprising a mouthpiece, a flexible portion, a tapered annular flange carried by the flexible portion for limiting its expansion, and a tapered expanded portion carried by the mouthpiece for expanding the flexible portion against said flange, substantially as described.

6. A horn comprising a rigid mouthpiece-section and a collapsible section, said collapsible section being expanded by a movement of one of said sections relatively to the other.

7. A horn comprising a rigid mouthpiece-section and a collapsible section, the former telescoping within the latter and operative to expand the latter by the movement relative thereto.

8. A horn comprising a rigid mouthpiece-section and a collapsible section, the former telescoping within the latter and the latter being expanded by a relatively longitudinal movement of one of said sections.

811,901. **HINGED-LEAF BUTTON.** HENRY CASE, Gloversville, N. Y. Filed Mar. 9, 1905. Serial No. 249,191.

Claim.—1. A button, having a hinged leaf, a spring upon which the hinged leaf is pivoted, a casing for the said spring and a shoe upon which the spring and casing are fixed against relative longitudinal movement.

2. A button, having a spring, a leaf provided with a two-part plate containing pivots engaging the spring, a casing for the said spring and a shoe upon which the spring and casing are fixed against relative longitudinal movement.

3. A button, having a spring provided with pivot-ears and locking-cams on said ears, a leaf having a pivot-plate pivoted to said ears and adapted to engage with the cams, a casing for said spring and a shoe upon which the spring and casing are fixed against relative longitudinal movement.

4. A button, having a hinged leaf, a spring upon which the hinged leaf is pivoted, a casing for the said spring and within which the spring is fixed against longitudinal movement and a shoe upon which the spring and casing are fixed against relative longitudinal movement.

5. A button, having a shoe, a casing fixed on said shoe, a two-armed spring fixed in said casing against longitudinal movement, the free ends of said arms having ears and cams and a leaf pivotally connected to said ears and adapted to coöperate with said cams so as to be capable of being held thereby in a position at right angles to the casing and in a position substantially parallel to the casing.

811,902. **HYDRAULIC CEMENT AND PROCESS OF MAKING THE SAME.** CARLE D. CLARK, Clifton, Ariz. Filed Dec. 24, 1904. Serial No. 238,201.

Claim.—1. The process of making hydraulic cement, which consists in hydraulically classifying the tailings from concentrating or other mills treating ores with an aluminous silicious gangue, mixing them with a calcareous substance, reducing the mass to powder, burning the mixture to a clinker, and pulverizing said clinker.

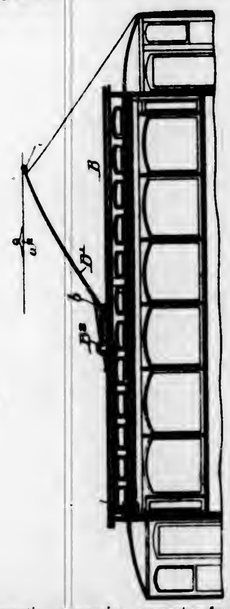
2. The process of making hydraulic cement, which consists in pulverizing tailings from concentrating or other mills treating ores with an aluminous silicious gangue, hydraulically classifying said pulverized tailings, combining them with a calcareous substance by clinkering, and then grinding the clinker.

3. A hydraulic cement composed of a base clinkered with hydraulically-classified tailings from concentrating or other mills treating ores with an aluminous silicious gangue.

4. A hydraulic cement composed of limestone clinkered with hydraulically-classified tailings from concentrating or other mills treating ores with an aluminous silicious gangue.

811,903. **ANNOUNCING DEVICE FOR RAILWAY-CARS.** ARTHUR D. CLOUD, Davenport, Iowa. Filed Apr. 1, 1905. Serial No. 253,377.

Claim.—1. In automatic announcing apparatus for electrically-propelled cars, the combination with a car provided with a laterally-swinging trolley-pole, an announcing device carried by the car, and means operated by the lateral swing of the trolley-pole for operating the announcing device.



2. In automatic announcing apparatus for electrically-propelled cars, the combination with a car provided with a laterally-swinging trolley-pole, an electrically-actuated announcing device carried by the car, a switch for controlling the circuit that operates the announcing device, and an electromagnet carried by the trolley-pole for operating said switch.

3. In automatic announcing apparatus for electrically-propelled cars, the combination with a car provided with a laterally-swinging trolley-pole, an announcing device carried by the car, a trolley-wire provided with laterally offset or displaced portions along which the trolley-wheel passes, and means operated by the lateral swing of the trolley-pole for operating the announcing device.

4. In automatic announcing apparatus for electrically-propelled cars, the combination with a car provided with a laterally-swinging trolley-pole, an electrically-actuated announcing device carried by the car and a trolley-wire provided with laterally offset or displaced portions along which the trolley-wheel passes, and a switch operated by the lateral swing of the trolley-pole for controlling the circuit that operates said announcing device.

5. In automatic announcing apparatus for electrically-propelled cars, the combination with a car provided with a laterally-swinging trolley-pole, an electrically-actuated announcing device carried by the car, a trolley-wire provided with laterally offset or displaced portions along which the trolley-wheel passes, a switch carried by the car for controlling the circuit that operates the announcing device, and an electromagnet carried by the swinging trolley-pole for operating said switch.

6. An announcing device for the purpose set forth, comprising an announcing-strip, a winding mechanism comprising rollers about which said strip is wound, and a locking mechanism for locking the winding mechanism, comprising a shaft which rotates with the winding-rollers, a disk on the shaft provided with a peripheral notch, a spring-pressed latch provided with a finger adapted to engage said notch to arrest the winding mechanism, means for retracting the latch from the disk, means for temporarily holding the latch away from the disk comprising a pivoted lever provided with a pivoted trigger which permits the latch to move past the same, but acts as a stop to hold the latch away from the disk, and a cam on said shaft acting on said lever to release the trigger from the said latch to permit the latter to interlock with the disk.

7. An electrically-actuated announcing device comprising an announcing-strip, winding mechanism embracing rollers about which the strip is wound, a motor for driving said winding mechanism, a locking mechanism for locking the winding mechanism comprising a disk which rotates with the winding-rollers, a spring-pressed latch adapted for locking engagement with the disk, a magnet for retracting said latch from the disk, means for temporarily holding said latch away from the disk and constructed to subsequently release the same, circuits in which said motor and magnet are included, and a quick-acting switch in the motor-circuit comprising a terminal carried by said latch adapted to be brought into contact with an associated terminal of the circuit when the latch is retracted from the locking-disk and to be separated to open the circuit when the latch again engages the locking-disk, a cam, a lever actuated by said cam and provided with a trigger past which the latch is moved when retracted from the disk, and which supports the same until said disk begins to rotate, the cam afterward acting on said lever to release the latch to permit it to drop into contact with the disk.

8. An electrically-actuated announcing device for the purpose set forth, comprising an announcing-strip, winding mechanism embracing rollers to which the ends of said strip are attached, a reversible electric motor for operating said winding mechanism, a locking device for arresting the winding mechanism and for releasing it preparatory to a further movement of the announcing-strip, and electrically-actuated means for reversing the motor to reverse the direction of movement of said strip, comprising opposing magnets, a switch located between and alternately acted upon by said magnets, normally open circuits in which said magnets are included, and a traveling terminal adapted to alternate engagement with the terminals of said normally open magnet-circuits.

9. An announcing device for the purpose set forth comprising an announcing-strip, winding mechanism embracing rollers to which the ends of said strip are attached, a reversible electric motor for operating said winding mechanism, a locking mechanism for arresting the winding mechanism at the end of a predetermined movement of the strip and for releasing the winding mechanism preparatory to a subsequent winding movement thereof, and a reversing-switch for reversing said motor embracing a swinging switch, opposed magnets on the opposite sides thereof, terminals carried by said switch adapted for engagement with opposing pairs of terminals of the motor-armature circuits, normally open circuits in which the actuating-magnets are included, and a traveling terminal adapted for alternate engagement with the terminals of said normally opened magnet-circuits.

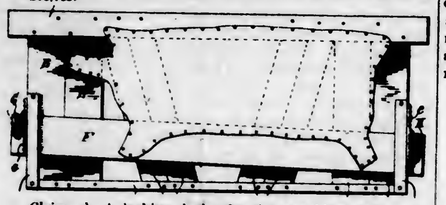
10. An announcing device for the purpose set forth, comprising an announcing-strip, winding mechanism embracing rollers to which the ends of the strip are attached, a reversible electric motor for actuating said winding mechanism, a locking device for locking the mechanism at the end of a predetermined movement of the strip, and for releasing said locking mechanism preparatory to a subsequent movement of the strip, embracing a shaft which rotates with the winding-rollers, a stop-disk on said shaft, an electrically-releasable locking-latch engaging said disk and a reversing-switch mechanism comprising a swinging switch provided with terminals adapted for alternate engagement with opposing pairs of terminals of the armature and field-magnet circuits, two opposing magnets included in normally open circuits by which said switch is swung on its pivot, said shaft being screw-threaded and a screw-threaded nut on said shaft which travels endwise of the shaft as the shaft revolves, and constituting a terminal of the normally open magnet-circuits adapted to engage stationary terminals of said magnet-circuits to close the same.

11. An announcing device for the purpose set forth, comprising an announcing-strip, a winding mechanism embracing rollers to which the ends of the strip are attached and upon which it is wound, an electric motor for actuating said winding mechanism, a stop device for arresting the winding mechanism, electrically-actuated means for releasing said stop device, normally open circuits in which said motor and releasing mechanism are included, and having adjacent terminals and a switch vibrating between said terminals for alternately opening and closing the motor and lock-releasing circuits.

12. An announcing device for the purpose set forth comprising an announcing-strip, a winding mechanism embracing rollers to which the ends of the strip are attached and upon which it is wound, an electric motor for actuating said winding mechanism, a stop device for arresting the winding mechanism, electrically-actuated means for releasing said stop device, normally open circuits in which said motor and releasing mechanism are included and having adjacent terminals, a switch vibrating between said terminals for opening and closing the releasing mechanism and motor-circuits, said motor-circuit being provided adjacent to the locking device with a normally open switch which is closed when the locking device is operated to release the winding mechanism, and is opened when the locking device is again brought into action to arrest the winding mechanism.

811,904. **LOCKING MECHANISM FOR STRETCHING-FRAMES.**

811,904. **LOCKING MECHANISM FOR STRETCHING-FRAMES.** JAMES A. COUNSELLY, Ludlow, Pa. Filed Sept. 1, 1905. Serial No. 276,769.



Claim.—1. A locking device for the movable member of a stretching-frame, comprising a strap having at one end a laterally-extending portion for engaging the edge of said member, and a pawl pivotally connected to the opposite end of said strap, substantially as described.

2. A locking device for the movable member of a stretching-frame, comprising a strap having at one end a laterally-extending hook-shaped portion, for engaging the edge of said member, and at the opposite end a laterally-projecting curved seat, projecting on the opposite side of said strap from said hook-shaped portion, a pawl having a curved portion engaging said seat, and a loose pivotal connection between said pawl and said strap, whereby the strain on said pawl is transmitted to said seat, substantially as described.

3. A locking device for the movable member of a stretching-frame comprising a strap having at one end a laterally-extending hook-shaped portion, and at the other end a laterally-extending flange provided with a curved seat, and a shoulder at each side of said seat, a pawl having one end constructed to engage said seat, and adapted to engage said shoulders to limit its movements, a pivotal device connecting said pawl and strap but permitting the engagement of the pawl with said seat, and means for attaching said strap to the said movable member to prevent accidental displacement, substantially as described.

4. A locking device for the movable member of a stretching-frame comprising a strap having a laterally-extending portion for engaging an edge of said movable member and provided with a laterally-projecting curved seat, of a reversible pawl having a curved end portion for engaging said seat, and means for pivotally connecting said pawl to said strap without interfering with its engagement with said seat, whereby said locking devices may be made right and left without alteration of parts, substantially as described.

5. The combination with a stretching-frame having stationary and movable stretching members, and provided with a toothed rack, of a locking device for the movable member, comprising a strap having a hook-shaped portion at one end to engage an edge of the movable member, and provided at its other end with a laterally-extending lug having a curved seat and shoulder at each side of said seat, a pawl having a curved portion at one end to engage said seat, and being loosely pivoted to said strap, and provided with a sharpened edge at its other end to engage said rack and means for attaching said strap to said movable member to prevent accidental displacement, substantially as described.

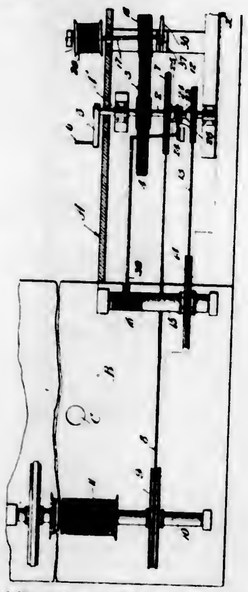
811,905. **WELL-DRILLING APPARATUS.** ALLEN CRAIG and EDWARD DOUBLE, Los Angeles, Cal. Filed May 31, 1904. Serial No. 210,329.

Claim.—1. A well-drilling rig comprising a band-wheel, a shaft therefor, pulleys or sheaves loose thereon, a clutch on the shaft adapted to revolve with said shaft, means for operatively connecting said clutch with either of said pulleys, a bull-wheel, a rope connecting the same with one of said pulleys, a calf or casing wheel, a rope connecting the same with the other pulley, and means for driving the band-wheel.

2. A well-drilling rig comprising a band-wheel, a shaft therefor, loose pulleys thereon, means operatively connected with said shaft for operatively connecting either of said pulleys with said shaft, a bull-wheel, a calf or casing wheel, belts connecting said bull and casing wheels with their respective pulleys on said shaft, and means for driving said band-wheel.

3. A well-drilling rig comprising a band-wheel, a shaft whereon the same is fixed, pulleys loose on said shaft, means for operatively connecting said pulleys to said shaft as desired means for connecting a walking-beam to said shaft, a bull-wheel a calf or casing wheel, means operatively connecting said bull and calf wheels with their respective loose pulleys, and means for driving said band-wheel.

4. A well-drilling rig comprising a band-wheel, a shaft whereon the same is fixed, pulleys loose on said shaft, means for operatively connecting said pulleys to said shaft as desired, means for connecting a walking-beam to said shaft, a bull-wheel, a calf or casing wheel, means operatively connecting said bull and calf wheels with their respective loose pulleys, a sand-reel driven from said band-wheel, and means for driving the band-wheel.

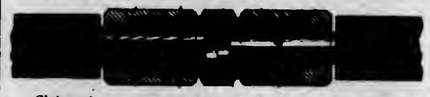


5. A well-drilling rig comprising a shaft, loose pulleys on said shaft, means for rotating said shaft, a bull-wheel, a calf-wheel, ropes connecting said bull-wheel and calf-wheel respectively with their respective loose pulleys, and means carried by said shaft whereby either of said loose pulleys may be operatively connected with said shaft to rotate therewith.

6. A well-drilling rig comprising a shaft, loose pulleys on said shaft, a clutch carried by said shaft, a shipping-lever for operating said clutch to engage either of said pulleys, a calf-wheel, a bull-wheel, means operatively connecting said calf and said bull wheels with their respective loose pulleys, and means for driving said shaft.

7. A well-drilling rig comprising a band-wheel, a shaft therefor, a loose pulley thereon, a clutch carried by said shaft for engaging said loose pulley, a calf-wheel, a rope or belt connecting said calf-wheel and loose pulley, a bull-wheel, means for driving said bull-wheel from said shaft, and means for operating said clutch.

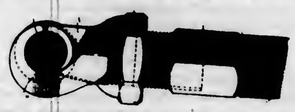
811,906. **ELECTRIC COUPLING.** JOHN J. DOSSERT, New York, N. Y., assignor to Dossert & Company, a Corporation of New York. Filed Aug. 17, 1904. Serial No. 221,063.



Claim.—1. A connector for electrical conductors comprising end coupling-sections having conductor-receiving openings, an intermediate coupling-section having a conductor-receiving opening, split sleeves having oppositely-tapered ends housed between each of said end coupling-sections, and said intermediate section, and means for drawing said end sections toward said intermediate section to compress said split sleeves, and force them into close mechanical and electrical contact with conductor ends.

2. A connector for electrical conductors comprising two internally-threaded end coupling-sections having oppositely-tapered bores, an externally-threaded intermediate coupling-section having a bore, the ends of which are oppositely tapered, and two split sleeves having oppositely-tapered ends housed within the tapered bores of said intermediate and end coupling-sections and adapted to be forced into close mechanical and electrical contact with conductor ends when the coupling-sections are drawn together.

811,907. **BRANCH COUPLING FOR ELECTRIC CONDUCTORS.** JOHN J. DOSSERT, New York, N. Y., assignor to Dossert & Company, a Corporation of New York. Filed Feb. 9, 1905. Serial No. 244,868.



Claim.—1. A branch coupling for electric conductors consisting of a hook provided with a shank, said hook constituting one member of a clamp, a member mounted on said shank, and formed with a clamping portion directly opposed to said hook, said member being movable to bring said clamping portion in clamping relation to the hook, means whereby said member is removable from the shank by lateral movement with relation thereto and means on the shank to move said member.

2. A branch coupling for electric conductors, consisting of a hook provided with a shank, said hook constituting one member of a clamp, a member slidably mounted on said shank and formed with a clamping portion directly opposed to said hook, said member being movable longitudinally of the shank to bring said clamping portion in clamping relation to the hook, means whereby said member may be removed from the shank by a lateral movement with relation thereto and means on the shank to slide said member.

3. A branch coupling for electric conductors consisting of a hook provided with a shank having a longitudinal opening therein, said hook constituting one member of a clamp, a member slidably disposed in said opening and laterally removable therefrom and formed with a clamping portion directly opposed to said hook, said member being movable longitudinally of the shank to bring said clamping portion in clamping relation to the hook and means on the shank to slide said member.

4. A branch coupling for electric conductors consisting of a hook constituting one member of a clamp, provided with a threaded shank having a longitudinal opening extending entirely through the same from side to side, a member slidably disposed in said opening and removable therefrom by lateral movement with relation to the shank, said member being formed with a clamping portion directly opposed to said hook, and a nut on said shank for moving said member longitudinally of the shank to bring the clamping portion in clamping relation to the hook.

5. A branch coupling for electric conductors, consisting of a shank provided with a clamping-jaw at one end, a clamping member slidably disposed on the said shank for movement toward and away from the jaw, means whereby said member is separable from the shank by lateral movement with relation thereto, and means carried by the shank to move the clamping member.

6. A branch coupling for electric conductors, consisting of a hook provided with a shank, said hook constituting one member of a clamp, a member slidably mounted on said shank and having a clamping portion to cooperate with said hook, and means whereby said member is removable from the shank by a lateral movement with relation thereto, and means to hold said member in clamping position.

811,908. **SPLIT-SLEEVE CONNECTOR.** JOHN J. DOSSERT, New York, N. Y., assignor to Dossert & Company, a Corporation of New York. Filed Feb. 9, 1905. Serial No. 244,867.

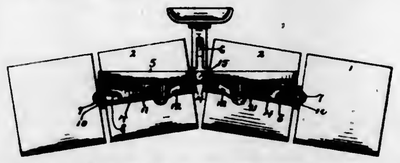
Claim.—1. The combination with the end of an electrical conductor, of a coupling-section surrounding the said end, an engaging coupling-section cooperating with the first-named coupling-section, and an intermediate conducting split sleeve having oppositely-tapering surfaces between the said coupling-sections and the conductor, the said coupling-sections being provided with internal oppositely-sloping surfaces corresponding to the surfaces of the sleeve and the sleeve itself being formed of two interlocking halves slitted throughout their entire length, each half being composed of a plurality of similar segments having flexible connections between them.

2. The combination with the bared end of a conducting wire or cable, of a conducting split sleeve having oppositely-tapering surfaces surrounding the said end, and coupling-sections provided with means for pressing lengthwise upon the tapering surfaces and compressing the split sleeve, the sleeve being formed in interlocking sections slitted through their entire length, each section being composed of a plurality of segments having flexible connections between them.

3. As an element of a coupling for the bared ends of conducting wires or cables, a conducting split sleeve having oppositely-tapering surfaces and formed in interlocking halves, each half being composed of a plurality of similar segments having flexible connections between them.

4. As an element of a coupling for the ends of conducting wires or cables, a conducting split sleeve formed in interlocking sections, each section composed of a plurality of segments having flexible connections between them.

811,909. **LAND-ROLLER.** WILEY J. DUNHAM, Berea, Ohio. Filed Sept. 23, 1905. Serial No. 279,593.



Claim.—1. In a land-roller, the combination of rollers, each roller having a separate shaft, a frame mounted on each of said shafts of said rollers, a draft-frame, means for forming a slidable connection between the frames of said rollers and said draft-frame and means for mechanically causing said rollers to move apart when either or both of the rollers are moved out of a horizontal position.

2. In a land-roller, the combination of rollers, each roller having a separate and independent shaft, a frame mounted on each of said shafts of said rollers, a draft-frame, means for forming a slidable connection between said frames of said rollers and said draft-frame and links securing the inner ends of said frames of said rollers to said draft-frame.

3. In a land-roller, the combination of rollers, each roller having a separate shaft, a frame mounted on each of said shafts, a draft-frame, means for forming a slidable connection between said roller-frames and said draft-frame, arms secured to said draft-frame and links connecting said arms and said roller-frames.

4. In a land-roller, the combination of rollers, each roller having a separate shaft, a frame mounted on each of said shafts, a draft-frame comprising two side pieces arranged to extend longitudinally of said rollers and a cross-bar secured to said side pieces at their center, and means for mounting said draft-frame on said roller-frames.

5. In a land-roller, the combination of a plurality of rollers, each roller having a separate shaft, a frame mounted on each of said shafts, a draft-frame arranged above said roller-frames, said draft-frame comprising two side pieces secured together by means of a cross-bar fastened to the respective side pieces near their centers, means for forming a slidable connection between said draft-frame and said roller-frames and links secured to said draft-frame and to said roller-frames.

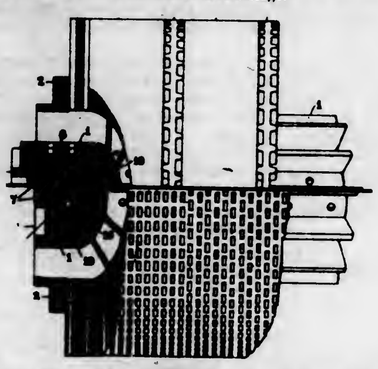
6. In a land-roller, the combination of rollers, each roller having a separate shaft, a rectangular frame mounted on each of said shafts, trunnions formed at the front and back of said frames at the outer ends thereof, a draft-frame, arms arranged on said draft-frame at the outer ends thereof and provided with slots arranged to receive said trunnions on said roller-frames, arms arranged on said draft-frame near the center thereof and links connecting said last-mentioned arms and the inner ends of said roller-frames, substantially as described and for the purpose set forth.

811,910. **CARTRIDGE.** ALBERT H. EMERY, Stamford, Conn. Filed Mar. 12, 1903. Serial No. 147,843.

Claim.—1. A plate of explosive material for cartridges constructed with raised ribs upon its opposite faces, the ribs on one face being opposite the spaces on the other and extending from the exterior toward the interior of the plate.

2. A cartridge constructed with a longitudinal series of transverse sections or plates of explosive material, each having a large

central opening, said plates or sections being separated from each other at suitable intervals by ribbed plates which form lighting-passages, the whole cartridge being suitably secured together, to form a cartridge with a large central orifice through which the gases of combustion can pass to the front of the cartridge.



3. A cartridge constructed with a longitudinal series of short transverse sections or plates of explosive material, each section being formed with or having a large central orifice coaxial with the cartridge, open to permit the free passage of the gases of combustion to the front of the cartridge, and secured together by a rod or rods of explosive material, said plates or sections being separated from each other at suitable intervals by ribbed plates which form lighting and venting passages.

4. A cartridge constructed with short transverse sections of explosive material, each section having a large number of longitudinal holes forming a burning-surface which increases as combustion progresses, and separating ribbed plates interposed between said sections at suitable intervals, said plates having igniting and venting passages, each of the said sections and plates having a large central orifice, coaxial with the cartridge, through which the gases of combustion can pass to the front of the cartridge.

5. A cartridge constructed with short transverse sections of explosive material, each section having a large number of longitudinal holes forming a burning-surface which increases as combustion progresses, and separating ribbed plates interposed between said sections at suitable intervals, said plates having igniting and venting passages, said sections and plates being suitably secured together, and each of the said sections and plates having a large central orifice, coaxial with the cartridge, through which the gases of combustion can pass to the front of the cartridge.

6. A cartridge constructed with short transverse sections of explosive material, each section having a large number of longitudinal holes minutely dividing the body of the sections into thin walls, and transmitting flame uniformly to all parts of the interior of the sections; said holes being hexagonal and disposed so as to give equal thickness of walls between them and insure substantial completion of combustion of most of the entire mass at the time the walls are burned through; and separating ribbed plates interposed between said sections at suitable intervals, said plates having igniting and venting passages, each of the said sections and plates having a large central orifice, coaxial with the cartridge, through which the gases of combustion can pass to the front of the cartridge.

7. In a cartridge, the central tube of explosive around which a large part of the cartridge is secured, said tube being constructed with a series of longitudinal ribs on its exterior which, with the surrounding cartridge, form longitudinal cells and longitudinal lighting and venting passages for the surrounding cartridge.

8. In a cartridge, the central tube of explosive around which a large part of the cartridge is secured, said tube being constructed with a series of longitudinal ribs on its exterior which, with the surrounding cartridge, form longitudinal cells and longitudinal lighting and venting passages for the surrounding cartridge, and having powder in these longitudinal cells.

9. In a cartridge, a central tube of explosive material, around which a large part of the cartridge is assembled, this tube having a series of cells or pockets, in which is placed explosive material, and caps or nuts to aid in securing powder placed in said pockets or cells.

10. A cartridge constructed with an exterior annular body of slow-burning powder, containing a longitudinal tube of explosive material interior thereto, through which the charge is ignited, having external radial ribs centering it within the body of slow-burning powder and forming pockets, and a rapid-pressure-developing powder contained within said pockets.

11. A cartridge constructed with an exterior annular body of slow-burning powder, containing a quick-burning charge of rapid-pressure-developing powder, a longitudinal tube containing the quick-burning powder and centering it within the exterior annular body, said containing-tube having a series of longitudinal external ribs forming large passages through which the gases from the slow-burning powder when developed can pass through to the front of the cartridge.

12. A cartridge consisting of separate concentric annular bodies of explosive material, perforated to increase their surface of combustion, and projections, ribs or rods, separating and holding said bodies concentric, and leaving large longitudinal air-spacing between them, through which the gases from combustion pass to the front of the cartridge.

13. A cartridge consisting of separate concentric annular bodies of explosive material perforated to increase their surface of combustion, and projections, ribs or rods, separating and holding said bodies concentric, and leaving large longitudinal air-spacing between them through which the gases from combustion pass to the front of the cartridge the exterior diameter of the inner annular body being smaller than the bore of the gun in which it is to be fired.

14. A cartridge consisting of separate concentric annular bodies of explosive material perforated to increase their surface of combustion, and projections, ribs or rods, separating and holding said bodies concentric, and leaving large longitudinal air-spacing between them through which the gases from combustion pass to the front of the cartridge, the exterior diameter of the outer annular body being nearly or quite equal to the diameter of the chamber of the gun in which it is to be fired.

15. A cartridge consisting of separate concentric annular bodies of explosive material perforated to increase their surface of combustion, and projections, ribs or rods, separating and holding said bodies concentric, and leaving large longitudinal air-spacing between them through which the gases from combustion pass to the front of the cartridge, the exterior diameter of the outer annular body being nearly or quite equal to the diameter of the chamber of the gun in which it is to be fired, the exterior diameter of the inner member being smaller than the bore of the gun and so secured to the outer that soon after combustion begins it will pass forward into the bore of the gun and be consumed while the outer body is consumed largely or wholly within the chamber of the gun.

16. A cartridge consisting of separate concentric annular bodies of explosive material perforated to increase their surface of combustion, longitudinal rods separating said bodies, so as to leave large air-spacing between them, and heads or nuts through which the rods secure the concentric bodies together.

17. A cartridge constructed with an outer annular body of slow-burning powder perforated with radial holes, with such thickness of walls that they will be substantially burned through at the time the projectile leaves the gun, and an inner annular body around a central stem of explosive material, said inner body being made up of series of longitudinal sections or thick plates separated from each other by thin ribbed plates, said longitudinal sections being perforated with a series of longitudinal holes, having such thickness of walls as will cause them to burn through when the projectile has reached that position in the chase of the gun where a large reduction of the burning-surface becomes desirable.

18. A cartridge constructed with an outer annular body of slow-burning powder perforated with radial holes, with such thickness of walls that they will be substantially burned through at the time the projectile leaves the gun, and an inner annular body around a central stem of explosive material, said inner body being made up of a series of longitudinal sections or thick plates separated from each other by thin ribbed plates, said longitudinal sections being perforated with a series of longitudinal holes, having such thickness of walls as will cause them to burn through when the projectile has reached that position in the chase of the gun where a large reduction of the burning-surface becomes desirable, the inner annular body being separated from the outer by an annular space which forms a passage for the flow of gases to the front of the cartridge.

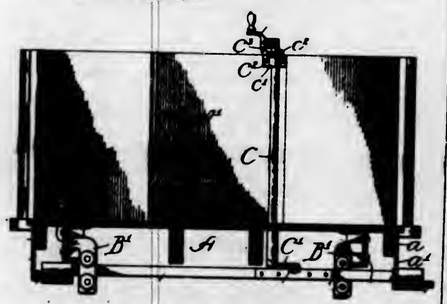
19. A cartridge constructed with an annular body perforated with a large number of radial holes minutely dividing up the walls for ignition and burning, with a rapidly-increasing surface of combustion, the size, form and arrangement of these perforations being such that the section of the perforation rapidly increases from the interior outward, and the walls around the perforations have substantially the same thickness throughout.

20. A cartridge constructed with an annular body perforated with a large number of radial holes minutely dividing up the walls for ignition and burning, with a rapidly-increasing surface of combustion, the size, form and arrangement of these perforations being such that the section of the perforation rapidly increases from the interior outward, and the walls around the perforations have substantially the same thickness throughout, said annular body having a large central orifice through which the products of combustion pass to the front of the cartridge.

21. A cartridge constructed with an outer and an inner annular body, one of which has a large number of radial perforations minutely dividing up the walls for ignition and burning and the other of which is constructed of a series of longitudinal sections perforated with a large number of longitudinal holes and separated from each other by ribbed plates which form igniting and venting passages.

22. A cartridge constructed with an outer and an inner annular body, the outer one of which has a large number of radial perforations minutely dividing up the walls for ignition and burning, and the inner of which is constructed of a series of longitudinal sections perforated with a large number of longitudinal holes, and separated from each other by ribbed plates which form igniting and venting passages.

811,911. CAR-STEP. DELBERT A. FAUT, Chicago, Ill. Filed Feb. 11, 1905. Serial No. 245,214.



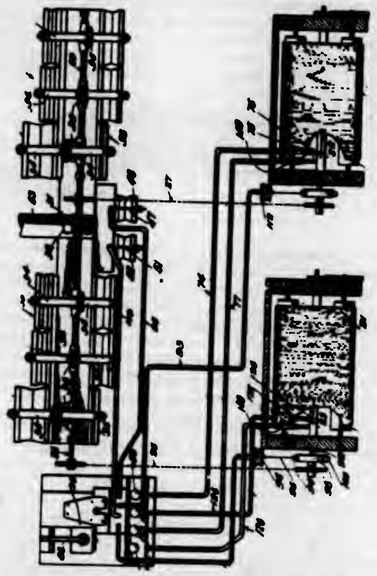
Claim.—1. The combination with a car-body of a transversely-slidable frame, a step fixedly mounted upon each end thereof, one of said steps being normally sheathed and the other normally projected, and means for actuating said sliding frame, for the purpose set forth.

2. The combination with a car-body of a transversely-slidable frame, steps supported thereon, a forwardly-projecting member connected with said frame, a rock-shaft equipped with an arm having pin-and-slot connection with said member, and means for actuating the rock-shaft, for the purpose set forth.

811,912. MUSICAL INSTRUMENT. WILLIAM B. FLEMING, South Pasadena, Cal. Filed Mar. 15, 1905. Serial No. 250,268.

Claim.—1. In a musical instrument in combination, two independently-traveling and independently-driven music-sheets, each provided with perforations at one side thereof arranged in pairs consisting of a long and a short perforation; independent motors for driving said sheets; means to supply power for driving said motors; means to cut off said power-supply for each sheet whenever it travels faster than its companion sheet, said means being actuated through the said short perforations, each sheet controlling its own cut-off mechanism; and means to restore said power-supply to either of said motors when the slower-traveling sheet catches up with the advance sheet, said means being actuated through the long perforations of both sheets.

2. In a musical instrument in combination, two independently-traveling music-sheets, each provided with perforations arranged in pairs consisting of a long and a short perforation; a take-up roll for each of said sheets; an independent motor for driving each of said take-up rolls; a brake for each take-up roll; means to supply power for driving said motors; means to cut off said power-supply for each sheet whenever it travels faster than its companion sheet, said means being actuated through the said short perforations, each sheet controlling its own cut-off mechanism; and means to restore said power-supply to either of said motors when the slower-traveling sheet catches up with the advance sheet, said means being actuated through the long perforations of both sheets.



3. In a musical instrument in combination, a perforated music-sheet provided with perforations arranged in pairs consisting of a long and a short perforation, each long perforation being arranged to project beyond both extremities of the short perforation; a take-up roll for said music-sheet; a motor for driving said take-up roll; a brake for said take-up roll; and pneumatically-actuated mechanism arranged to control said motor and said brake.

4. In combination two perforated music-sheets, each provided with perforations at one side thereof arranged in pairs consisting of a long and a short perforation; two shafts on which said sheets are mounted, one sheet on each shaft; independent motors for driving said shafts; said motors having the driving-shafts thereof in common line; disks secured upon the contiguous ends of said motor-shafts, one disk being secured to one shaft and the other disk being secured to the other shaft; means to supply power for driving said motors; means to cut off said power-supply for each sheet whenever it travels faster than its companion sheet, said means being actuated through the said short perforations, each sheet controlling its own cut-off mechanism; and means to restore said power-supply to either of said motors when the slower-traveling sheet catches up with the advance sheet, said means being actuated through the long perforations of both sheets.

5. In a musical instrument a plurality of perforated music-sheets, each provided with perforations at one side thereof arranged in pairs consisting of a long and a short perforation; take-up rolls mounted on shafts, one for each sheet, said take-up rolls being provided with means for securing said music-sheets thereto; motors composed of a plurality of oppositely-disposed pneumatics, one motor for each take-up roll; crank-shafts operatively connected to said pneumatics, one for each motor; means to alternately connect the members of each pair of pneumatics of said motors to suction; means to connect the shaft driven by said motors with the take-up rolls of the music-sheet; means governed by the short perforations at the edges of the music-sheet to cut off the power which drives the motors whereby the travel of the music-sheets is stopped, each sheet controlling its own stop-page mechanism; and means to restore the power to the stopped motor, said means being controlled by the long perforations of both sheets.

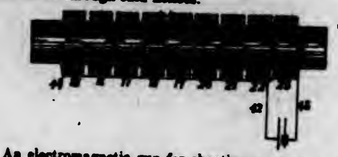
811,913. ELECTRIC GUN. SAMUEL T. PEETS, Jr., Victoria, Mexico, assignor of three-fourths to Obed C. Billman, Lodi, Ohio. Filed Dec. 16, 1903. Serial No. 184,725.

Claim.—1. In an electromagnetic gun, the combination with a

suitable barrel, a series of openings arranged along said barrel, and insulated walls formed within said openings, of a projectile adapted and arranged to overlap and separate the magnetic fields of the

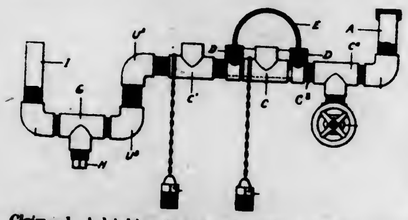
plunger operating in said receiver, a supporting-frame with spaced and comprising a plate having a pair of shoulders arranged on oppo-

suitable barrel, a series of openings arranged along said barrel, and insulated walls formed within said openings; of a series of connector-plugs mounted in said openings and normally insulated from said barrel and adapted to contact with a projectile having magnetic properties, a spring adapted to normally hold said connector-plugs in contact with said insulated walls, an insulated electric wire wound about said barrel to form a series of helices connected to said connector-plugs, and an electric generator connected to said connector-plugs and said barrel through said helices.



2. An electromagnetic gun for shooting magnetic projectiles, comprising a suitable barrel, a series of surrounding coils or helices, a series of openings arranged along said barrel, insulated walls formed about said openings, a series of connector-plugs mounted in said openings and normally adapted to be engaged by the projectile, a series of springs mounted in said openings and adapted to normally hold said connector-plugs in contact with said insulated walls, and an electric generator connected to said helices and barrel.

811,914. **POULTRY-FOUNTAIN.** GRANT F. GILLENWATERS, East Sacramento, Cal. Filed Sept. 2, 1905. Serial No. 276,854.



Claim.—1. A drinking-fountain comprising a conduit provided with an inlet and outlet, a drinking-cup normally open to the atmosphere and connected with the conduit and interposed between said inlet and outlet, said outlet arranged slightly below the level of the top of the cup whereby flow may take place through the conduit without overflowing the cup, said cup arranged at an elevation above the ground, an incline leading up to said cup, and a wicket partly inclosing the cup.

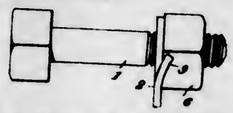
2. A drinking-fountain comprising a conduit formed of a series of conjoined pipe-sections and pipe connections, said conduit having upturned ends arranged at different levels and provided with an inlet intermediate of its ends, drinking-cups comprising T's interposed in the conduit with central branches pointed upward and normally open to the atmosphere, the outlet end of said conduit arranged at a slightly lower level than the top of said upturned branches.

3. A drinking-fountain comprising a conduit composed of a series of conjoined pipe sections and connections, said conduit having an inlet, and having a drop U-shaped portion adjacent to its discharge end, a drain-plug in the bend of said U, drinking-cups between said U and the inlet, and the upper end of the outer arm of the U arranged at a lower level than the top of said cups.

811,915. **PNEUMATIC-TUBE CASH-CARRIER.** DANIEL S. HAGER, Toledo, Ohio. Filed Nov. 9, 1905. Serial No. 286,492.

Claim.—In a device of the described character, a pair of cylindrical shells disposed one within the other and rotatable relatively to each other, said shells having corresponding openings in their sides adapted to be thrown into and out of coincidence, a stop secured to the inner shell and adapted to engage the edge of the opening in the outer shell, and a guide-piece upon the stop, said guide-piece being adapted and arranged to overlap and engage the margin of the opening in the outer shell.

811,916. **NUT-LOCK.** LEMUEL A. HALL, Christiana, Pa. Filed Apr. 4, 1905. Serial No. 253,949.

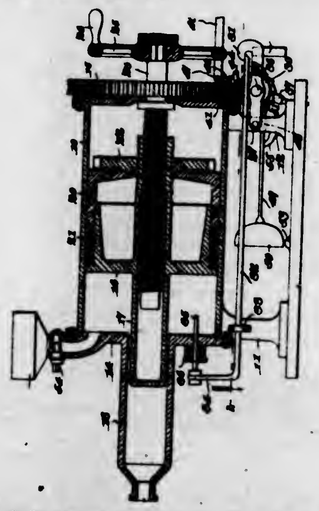


Claim.—1. A nut-lock comprising a bolt, a nut coöperating therewith, a washer having a tongue adapted to be bent up into engagement with said nut in order to prevent any relative turning thereof, and a separable locking member fitting in a recess in the washer having communication with the bolt-receiving opening therein, and adapted to bite into the threads of the bolt to prevent any turning of the washer thereon.

2. In a nut-lock, the combination of a bolt, a nut, a washer having a dovetail recess in communication with the opening therein, and also having a locking-tongue adapted to be bent up into engagement with an edge of said nut, and a locking member of approximately triangular form in cross-section and adapted to fit in the aforementioned dovetail recess and to bite into the threads of said bolt.

3. In a nut-lock, the combination of a bolt, a nut, a washer having a dovetail recess in communication with the opening therein, and also having a locking-tongue adapted to be bent up into engagement with an edge of said nut, and a locking member of approximately triangular form in cross-section and adapted to fit in the aforementioned dovetail recess and bite into the threads of the bolt, the biting edge of said locking member being beveled off to admit of its being easily placed in position and of its ready advancement under action of the nut.

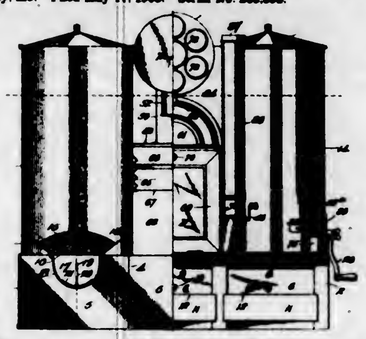
811,917. **LUBRICATOR.** JOSEPH HANSON, Inwood, Iowa. Filed Oct. 23, 1905. Serial No. 284,080.



Claim.—1. In a force-feed lubricator, a receiver for the lubricant, a plunger operating in said receiver, a supporting-frame with spaced sides having bearings intermediate the ends and connected at one end by a transverse member and swinging from the other end, one of said side members having a catch-recess, a drive-shaft journaled in said bearings, means for constantly rotating said shaft, gearing between said shaft and plunger, a movable member detachably engaging said recess, a trip disposed in the path of the plunger and operatively connected to said movable member, whereby when the plunger reaches a certain predetermined position the trip will be actuated to release the frame and permit the gearing to be disconnected by gravity.

2. In a force-feed lubricator, a receiver for the lubricant, a plunger operating in said receiver, a supporting-frame with spaced sides having bearings intermediate the ends and connected at one end by a transverse member and swinging from the other end, a drive-shaft journaled in said bearings and extended at one end beyond the frame, a ratchet-wheel carried by the extended end of said shaft, an arm swinging upon said shaft and provided with pawls engaging said ratchet, means for vibrating said arm to cause the constant intermittent rotation of said shaft, gearing between said shaft and plunger, a trip movably disposed in the path of the plunger and detachably engaging said frame, and means for causing the plunger to actuate the trip.

811,918. **KITCHEN-CABINET.** WILLIAM M. HENSON, Kansas City, Mo. Filed May 17, 1905. Serial No. 260,866.



Claim.—1. A kitchen-cabinet, comprising a base, cylinders mounted thereon, front and back plates also mounted thereon and connecting said cylinders, accordion cleats secured at their front ends to the front plate and at their rear ends to the back plate, an adjustable shelf carried by said cleats, and a door-controlled opening in said front plate to give access to the space between said cleats and below said shelf.

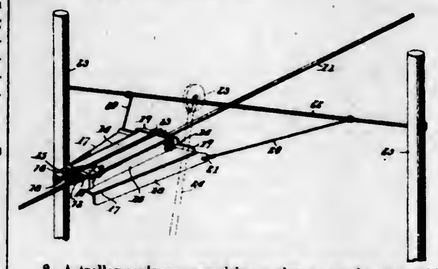
2. A kitchen-cabinet, comprising a base, cylinders mounted thereon, front and back plates also mounted thereon and connecting said cylinders, a drum secured in the upper ends of the front and back plates and having a transverse partition, a cup depending from the rear compartment of the drum and provided with a pair of stationary apertured plates, a valve for said cup, comprising a pair of apertured plates to operate in conjunction with the first-named plates for discharging a measured quantity of the commodity in the rear compartment of the drum, and a crank-handle for operating said valve to effect such discharge or to close the bottom of the cup; a horizontal partition connecting the front and rear plates below the cup, and a door-controlled opening in the front plate to give access to the space between the cup and said partition.

3. A kitchen-cabinet, comprising a base, cylinders mounted thereon, front and back plates also mounted thereon and connecting said cylinders, a drum secured in the upper ends of the front and back plates, and having a transverse partition, a cup depending from the rear compartment of the drum and provided with a pair of stationary apertured plates, a valve for said cup, comprising a pair of apertured plates to operate in conjunction with the first-named plates for discharging a measured quantity of the commodity in the rear compartment of the drum, and a crank-handle for operating said valve to effect such discharge or to close the bottom of the cup, a reciprocatory rod suitably guided and pivoted to said crank-handle, a horizontal partition connecting the front and rear plates below the cup, and a door-controlled opening in the front plate to give access to the space between the cup and said partition.

4. A kitchen-cabinet comprising a base having its front side rounded and provided with a plurality of openings in the rounded portion, segmental doors normally closing said openings and fitting within the base and provided at their lower edges with flanges to externally embrace the contiguous portion of the base, and at their rear edges with weighted ends within the base, and with end pieces having a pivotal relation with the base, the plane of the pivotal point being forward of the weighted ends of the doors.

811,919. **TROLLEY-REPLACER.** ROBERT B. HIGGINS, St. Louis, Mo. Filed Aug. 14, 1905. Serial No. 274,132.

Claim.—1. A trolley-replacer for application to a trolley-wire and comprising a plate having a pair of shoulders arranged on opposite sides of, and spaced from the wire, the outer sides of the shoulders being provided with inclined flanges for directing a trolley-wheel into engagement with the wire.



2. A trolley-replacer comprising a plate secured at its middle line to the trolley-wire and having flanges on each side adjacent the wire at one end and receding from the wire and from each other toward the opposite end, and shoulders disposed between the flanges and the wire.

3. The combination with a trolley-wire, of a member having a shoulder extending longitudinally thereof and adjacent to and below the wire, the said shoulder widening laterally throughout its length and provided along its outer longitudinal edge with a downturned flange.

4. The combination with a trolley-wire, of a member provided with a groove embracing the wire, means for clamping the groove upon the wire, a shoulder extending parallel with the groove and adjacent and below the wire the said shoulder widening laterally throughout its length and provided along its outer longitudinal edge with a downturned flange.

5. The combination with a trolley-wire, of a member provided with a longitudinal groove embracing the wire and means for clamping the wire within the groove, a shoulder extending parallel with the groove and adjacent to and below the wire and separated therefrom by a longitudinal channel, the said shoulder widening laterally throughout its length and provided along its longitudinal edge with a downturned flange.

6. The combination with a trolley-wire, of a member provided with a central longitudinal fold embracing the wire, means for clamping the wire within the fold, longitudinal shoulders adjacent to and parallel with and upon opposite sides of and below the wire and separated therefrom by longitudinal channels, the said shoulders widening laterally throughout their lengths, and guy-wires secured to the sides of the member and arranged to hold the member horizontal and from longitudinal displacement upon the trolley-wire.

811,920. **ADDING-MACHINE.** GEORGE N. HINCHMAN and HENRY SCHROEDER, St. Louis, Mo., assignors to The Standard Adding Machine Company, St. Louis, Mo., a Corporation of Missouri. Filed Jan. 25, 1904. Serial No. 190,506.

Claim.—1. In an adding-machine, the combination with adding devices corresponding to the numerical orders, of a series of keys, movable members each actuated by one of said keys, a movable member actuated by all of said keys, and a translating device bringing said adding devices successively within control of both of said movable members.

2. In an adding-machine, the combination with adding devices corresponding to the numerical orders, of a series of keys, cradles each actuated by one of said keys, a cradle actuated by all of said keys, and a translating device bringing said adding devices successively within control of both of said cradles.

3. In an adding-machine, the combination with adding devices corresponding to the numerical orders, of indicating devices for said adding devices, a series of keys, movable members each actuated by one of said keys, a movable member actuated by all of said keys, and a translating device bringing said indicating devices successively within control of both of said movable members.

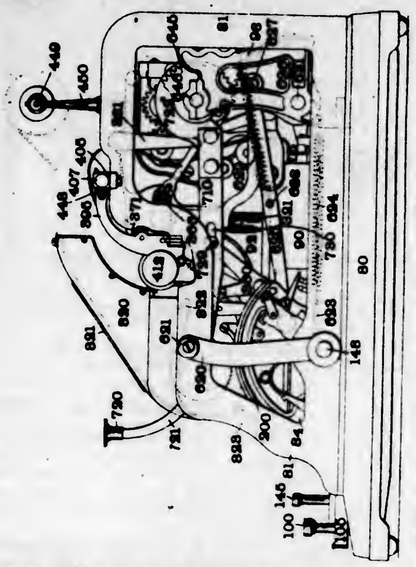
4. In an adding-machine, the combination with adding devices corresponding to the numerical orders, of a series of keys, a plurality of cradles each actuated by one of said keys, a cradle actuated by all of said keys, and a translating device bringing said adding devices successively within control of both of said cradles.

5. In an adding-machine, the combination with adding devices corresponding to the numerical orders, of a series of keys, a plurality

of cradles each actuated by one of said keys, a cradle actuated by all

ber actuated by said order-keys, a locking device actuated by said

of cradles each actuated by one of said keys, a cradle actuated by all of said keys, a carriage, and movable members mounted in said carriage, each movable member cooperating with a single cradle and successively bringing said adding devices within control of both of said cradles.



6. In an adding-machine, the combination with adding devices corresponding to the numerical orders, of a set of keys, a plurality of cradles provided with cross-bars, a translating device for bringing said adding devices successively within control of said cross-bars, pendent links pivoted to said cradles, cross-bars carried by said links, and means for actuating said latter cross-bars from said keys.

7. In an adding-machine, the combination with adding devices corresponding to the numerical orders, of a series of keys, cradles provided with cross-bars, a translating device for bringing said adding devices successively within control of said cross-bars, pendent links pivoted to said cradles, cross-bars removably carried in said links, and means for actuating said latter cross-bars from said keys.

8. In an adding-machine, the combination with adding devices corresponding to the numerical orders, of a series of keys, supporting devices provided with hooks, cradles pivotally mounted in said hooks, translating devices for successively bringing said adding devices within control of said cradles, pendent links pivoted to said cradles and arranged below said supporting members, whereby the displacement of the cradles is prevented, cross-bars carried by said links, and means for actuating said cross-bars from said keys.

9. In an adding-machine, the combination with adding devices corresponding to the numerical orders, of a series of keys, cradles, a translating device successively bringing said adding devices within control of said cradles, pendent links pivoted to said cradles, cross-bars carried by said links, guides for said cross-bars, and means for operating said cross-bars from said keys.

10. In an adding-machine, the combination with adding devices corresponding to the numerical orders, of a series of keys, cradles, a translating device successively bringing said adding devices within control of said cradles, pendent links carried by said cradles, cross-bars carried by said links, a set of stops on said keys each adapted to cooperate with one of said cross-bars, and a second set of stops each adapted to cooperate with a different cross-bar.

11. In an adding-machine, the combination with adding devices, of a translating device, a series of order-keys controlling said translating device, a set of digit-keys controlling said adding devices, a movable member actuated by the operation of said order-keys, and a locking mechanism operated by the movement of said digit-keys for locking said movable member and thereby said order-keys.

12. In an adding-machine, the combination with adding devices, of a translating device, order-keys controlling said translating device, digit-keys controlling said adding devices, a movable member actuated by said order-keys, a locking device actuated by said digit-keys to lock said movable member, an operating-handle, and means for releasing said locking device by the movement of said handle.

13. In an adding-machine, the combination with adding devices, of digit-keys controlling said adding devices, an operating-handle, a full-stroke device for said handle, reversing means for said full-stroke device, and connections for rendering said reversing means inoperative.

14. In an adding-machine, the combination with adding devices, of digit-keys controlling said adding devices, an operating-handle, a full-stroke device for said handle, reversing means for said full-stroke device, and connections operated by the movement of said digit-keys for rendering said reversing device inoperative.

15. In an adding-machine, the combination with adding devices, of a translating device, order-keys for controlling said translating device, an operating-handle, a lock for said handle, and mechanism operating through the movement of said order-keys for controlling said lock.

16. In an adding-machine, the combination with adding devices, of a translating device, order-keys for controlling said translating device, digit-keys for controlling said adding devices, an operating-handle, a lock for said handle, mechanism controlled by the movement of said order-keys for controlling said lock, and a second mechanism operated by the movement of said digit-keys for controlling said lock.

17. In an adding-machine, the combination with adding devices corresponding to the numerical orders, of a plurality of stops controlling said adding devices, keys for positioning said stops, positive locking means for locking said stops in position, and a repeat-key for actuating said locking means.

18. In an adding-machine, the combination with adding devices corresponding to the numerical orders, of a plurality of stops for controlling said adding devices, keys for positioning said stops, locking devices for said stops, mechanism for returning said stops to normal position, and a repeat-key for operating said locking devices and throwing said mechanism out of operation

19. In an adding-machine, the combination with adding devices corresponding to the numerical orders, of a plurality of stops controlling said adding devices, keys for positioning said stops, a locking-plate locking said stops in position, and a repeat-key for operating said plate.

20. In an adding-machine, the combination with adding devices corresponding to the numerical orders, of a plurality of stops controlling said adding devices, keys for positioning said stops, a plate for returning said stops to normal position, and a locking-plate carried by said first-named plate and movable relative thereto.

21. In an adding-machine, the combination with adding devices corresponding to the numerical orders, of a plurality of stops controlling said adding devices, keys for positioning said stops, a plate for returning said stops to their normal position, and a locking-plate slidably mounted on said first-named plate.

22. In an adding-machine, the combination with adding devices corresponding to the numerical orders, of a plurality of stops controlling said adding devices, keys for positioning said stops, and a locking-plate for locking said stops, said locking-plate being provided with means for completely positioning any stop which has been partly positioned.

23. In an adding-machine, the combination with adding devices corresponding to the numerical orders, of a plurality of stops controlling said adding devices, pins carried by said stops, keys for positioning said stops, a locking-plate cooperating with said pins to lock said stops, and inclined tongues carried by said locking-plate for operating on said pins to position any stop which has been partially positioned.

24. In an adding-machine, the combination with adding devices corresponding to the numerical orders, of a plurality of stops controlling said adding devices, pins carried by said stops, keys for positioning said stops, a plate cooperating with said pins to return said stops to their normal position, and a locking-plate carried by said first-named plate and cooperating with said pins to lock said stops in position.

25. In an adding-machine, the combination with adding devices corresponding to the numerical orders, of a plurality of stops controlling said adding devices, pins carried by said stops, keys for positioning said stops, a plate cooperating with said pins to return said stops to their normal position, and a locking-plate slidingly carried by said first-named plate and cooperating with said pins to lock said stops in position.

26. In an adding-machine, the combination with adding devices corresponding to the numerical orders, of a plurality of stops for controlling said adding devices, keys for positioning said stops, and a spring-mounted plate movable in the direction of the length of said stops for returning said stops to their normal position.

27. In an adding-machine, the combination with digit-keys, of printing devices controlled thereby, hammers cooperating with said printing devices, actuating mechanism for said hammers, and an error-key for throwing said actuating mechanism out of operation.

28. In an adding-machine, the combination with digit-keys, of printing devices actuated thereby, hammers for said printing devices, pivotally-mounted plates, hooks carried by said plates and adapted to engage said hammers, and a translating device for positioning said plates to cause the engagement of said hooks and hammers.

29. In an adding-machine, the combination with digit-keys, of printing devices controlled thereby, hammers for said printing devices, pivoted plates, hooks carried by said pivoted plates and adapted to engage with said hammers, a translating device for causing said hooks to engage with said hammers, and an error-key for disengaging said hooks from said hammers.

30. In an adding-machine, the combination with digit-keys, of printing devices controlled thereby, hammers for said printing devices, pivotal plates, hooks mounted on said plates, a translating device for causing the engagement of said hooks and hammers, and an error-key for disengaging said hooks and hammers.

31. In an adding-machine, the combination with digit-keys, of printing devices controlled thereby, hammers for said printing devices, pivoted plates, hooks pivotally carried by said plates and adapted to engage with said hammers, an operating-handle for actuating said plates to operate said hammers, and an error-key for moving said hooks independently of said plates to disengage said hooks and hammers.

32. In an adding-machine, the combination with digit-keys, of printing devices controlled thereby, hammers for said printing devices, pivotal plates carrying hooks adapted to engage said hammers, detents controlling said plates, and a translating device for releasing said detents

33. In an adding-machine, the combination with digit-keys, of printing devices controlled thereby, hammers for said printing devices, pivotal plates, hooks pivoted on said plates and adapted to engage said hammers, detents controlling said plates, a translating device for releasing said detents, and an error-key for moving said hooks independently of said plates to release said hooks from said hammers.

34. In an adding-machine, the combination with digit-keys, of printing devices controlled thereby, hammers for said printing devices, mechanism for operating said hammers, a translating device for positioning said operating mechanism, and a locking device for locking said mechanism in its operative position.

35. In an adding-machine, the combination with digit-keys, of printing devices controlled thereby, hammers for said printing devices, operating mechanism for said hammers, a translating device for positioning said operating mechanism, a locking device for locking said mechanism in operative position, and a repeat-key controlling said locking device.

36. In an adding-machine, the combination with digit-keys, of printing mechanism controlled thereby, hammers for said printing mechanism, pivotal plates for operating said hammers, detents controlling the position of said plates, and a locking device for said detents.

37. In an adding-machine, the combination with digit-keys, of printing devices controlled thereby, hammers for said printing devices, pivotal plates operating said hammers, detents controlling the position of said plates, a locking device for said detents, and a repeat-key controlling said locking device.

38. In an adding-machine, the combination with digit-keys, of printing devices controlled thereby, hammers for said printing devices, pivotal plates, hooks pivoted on said plates and adapted to actuate said hammers, a member adapted to cooperate with said hooks to release the same from said hammers, and means for actuating said member.

39. In an adding-machine, the combination with digit-keys, of printing devices controlled thereby, hammers for said printing devices, pivotal plates, hooks pivoted on said plates and adapted to actuate said hammers, a movable member adapted to release said hooks from said hammers, and an error-key for actuating said member.

40. In an adding-machine, the combination with digit-keys, of printing devices controlled thereby, hammers for said printing devices, pivotal plates, hooks pivoted on said plates and adapted to actuate said hammers, projections carried by said hooks, a blade adapted to cooperate with said projections and release said hooks from said hammers, and an error-key for actuating said blade.

41. In an adding-machine, the combination with digit-keys, of printing devices controlled thereby, hammers for said printing devices, pivotal plates, hooks pivoted to said plates and adapted to actuate said hammers, projections carried by said hooks, a blade for cooperating with said projections to release said hooks from said hammers, an error-key, a sliding member actuated by said error-key, and a pivotal finger carried by said sliding member and adapted to operate said blade.

42. In an adding-machine, the combination with digit-keys, of printing devices controlled thereby, hammers for said printing devices, pivotal plates, hooks carried by said plates and adapted to actuate said hammers, an error-key, mechanism operated by said error-key for moving said hooks independently of said plates to release said hooks and hammers, and mechanism also operated by said error-key for returning said plates to their normal position.

43. In an adding-machine, the combination with digit-keys, of printing devices controlled thereby, detents for said printing devices, an error-key, and connections operated by said error-key for releasing said detents.

44. In an adding-machine, the combination with adding devices, of pivotal members controlling said adding devices, digit-keys controlling said pivotal members, a total-key, and an alining device for said pivotal members operated by said total-key.

45. In an adding-machine, the combination with adding devices, of printing-sectors provided with teeth for engaging said adding devices, digit-keys controlling said printing-sectors, an alining device engaging with the teeth of said sectors to aline the printing, and a total-key for operating said alining device.

46. In an adding-machine, the combination with printing-sectors, of pivoted hooks engaging directly with said printing-sectors, stops for individually releasing said hooks, digit-keys for operating said stops, and a total-key for simultaneously releasing all of said hooks.

47. In an adding-machine, the combination with printing-sectors, of a pivotally-mounted shaft, hooks pivoted on said shaft, means for individually swinging said hooks on said shaft and releasing the sectors, and means for swinging said shaft to release all of said sectors.

48. In an adding-machine, the combination with printing-sectors, of a pivotally-mounted shaft, hooks pivoted on said shaft and engaging said sectors, an abutment, projections carried by said hooks, digit-keys for individually swinging said hooks on said shaft and releasing said sectors, and a total-key for swinging said shaft to bring said projections in engagement with said abutment and release all of said sectors.

49. In an adding-machine, the combination with a plurality of toothed members corresponding to the numerical orders, of idle wheels and carrying devices immovable toward and away from each other but movable toward and away from said toothed members, and adding-wheels movable relatively to said idle wheels and carrying devices.

50. In an adding-machine, the combination with a plurality of pivoted toothed members corresponding to the numerical orders, of idle wheels and carrying devices immovable toward and away from each other but movable toward and away from said pivoted toothed members, and adding-wheels movable relatively to said idle wheels and carrying devices.

51. In an adding-machine, the combination with a plurality of toothed printing-sectors, of idle wheels and carrying devices immovable toward and away from each other but movable toward and away from said printing-sectors, and adding-wheels movable relatively to said idle wheels and carrying devices.

52. In an adding-machine, the combination with a plurality of toothed members corresponding to the numerical orders, of a movable frame, idle wheels and carrying devices carried by said frame, a second frame carried by said first-named frame, and adding-wheels carried by said second frame and movable relatively to said idle wheels and carrying devices.

53. In an adding-machine, the combination with a plurality of pivoted toothed members corresponding to the numerical orders, of a movable frame, idle wheels and carrying devices carried by said frame, a second frame carried by said first-named frame, and adding-wheels carried by said second frame and movable relatively to said idle wheels and carrying devices.

54. In an adding-machine, the combination with a plurality of toothed printing-sectors, of a movable frame, idle wheels and carrying devices carried by said frame, a second frame carried by said first-

named frame, and adding-wheels carried by said second frame and movable relatively to said idle wheels and carrying devices.

named frame, and adding-wheels carried by said second frame and movable relatively to said idle wheels and carrying devices.

55. In an adding-machine, the combination with a plurality of toothed members corresponding to the numerical orders, of a pivoted frame, idle wheels and carrying devices carried by said frame, a second movable frame carried by said first-named frame, and adding-wheels carried by said second frame and movable relatively to said idle wheels and carrying devices.

56. In an adding-machine, the combination with a plurality of pivoted toothed members corresponding to the numerical orders, of a pivoted frame, idle wheels and carrying devices carried by said frame, a second movable frame carried by said first-named frame, and adding-wheels carried by said second frame and movable relatively to said idle wheels and carrying devices.

57. In an adding-machine, the combination with a plurality of toothed printing-sectors, of a pivoted frame, idle wheels and carrying devices carried by said frame, a second movable frame carried by said first-named frame, and adding-wheels carried by said second-named frame and movable relatively to said idle wheels and carrying devices.

58. In an adding-machine, the combination with a plurality of toothed members corresponding to the numerical orders, of a pivoted frame, idle wheels and carrying devices carried by said frame, a second frame pivoted to said first-named frame, and adding-wheels carried by said second-named frame.

59. In an adding-machine, the combination with a plurality of pivoted toothed members, of a pivoted frame, idle wheels and carrying devices carried by said frame, a second frame pivoted to said first-named frame, and adding-wheels carried by said second frame.

60. In an adding-machine, the combination with a plurality of toothed printing-sectors, of a pivoted frame, idle wheels and carrying devices carried by said frame, a second frame pivoted to said first-named frame, and adding-wheels carried by said second-named frame.

61. In an adding-machine, the combination with a plurality of toothed members corresponding to the numerical orders, of digit-keys controlling said toothed members, a movable frame, idle wheels carried by said frame, carrying mechanism also carried by said frame, and adding mechanism normally in engagement with said carrying mechanism, and means for moving said adding mechanism into engagement with said idle wheels.

62. In an adding-machine, the combination with a plurality of toothed members corresponding to the numerical orders, of digit-keys controlling said toothed members, a movable frame, idle wheels carried by said frame and normally out of engagement with said toothed members, adding mechanism also carried by said frame, a second movable frame, adding-wheels carried by said movable frame and means for moving said adding-wheels out of engagement with said carrying mechanism into engagement with said idle wheels.

63. In an adding-machine, the combination with a plurality of toothed members corresponding to the numerical orders, of digit-keys controlling said toothed members, idle wheels normally out of engagement with said toothed members, adding-wheels operated by said idle wheels, a total-key, and connections operated by said total-key for moving said idle wheels into engagement with said toothed members.

64. In an adding-machine, the combination with a plurality of toothed members corresponding to the numerical orders, of digit-keys controlling said toothed members, a movable frame, idle wheels carried by said frame and normally out of engagement with toothed members, adding mechanism also carried by said frame, a second movable frame, adding-wheels carried by said second frame, an operating-handle, connections operated by said handle for moving said first-named frame to bring said idle wheels into engagement with said toothed members, and means also operated from said handle for moving said adding-wheels into engagement with said idle wheels.

65. In an adding-machine, the combination with a plurality of toothed members corresponding to the numerical orders, of digit-keys controlling said toothed members, a pivotal frame, idle wheels carried by said frame and normally out of engagement with said toothed members, carrying mechanism also carried by said frame, a second pivotal frame, adding-wheels carried by said frame and normally in engagement with said adding mechanism, means for moving said idle wheels into engagement with said toothed members, and means for moving said adding-wheels into engagement with said idle wheels and out of engagement with said carrying mechanism.

66. In an adding-machine, the combination with a plurality of toothed members corresponding to the numerical orders, of digit-keys controlling said toothed members, a pivotal frame, idle wheels carried by said frame and normally out of engagement with toothed members, carrying mechanism also carried by said frame, a second pivotal frame, adding-wheels carried by said second frame and normally in engagement with said carrying devices, an operating-handle, means actuated by said handle for moving said idle wheels into engagement with said toothed members, and mechanism also operated by said handle for moving said adding-wheels into engagement with said idle wheels.

67. In an adding-machine, the combination with a plurality of toothed members corresponding to the numerical orders, of digit-keys controlling said toothed members, a movable frame, idle wheels carried by said frame and normally out of engagement with said toothed members, carrying mechanism also carried by said frame, adding-wheels normally in engagement with said carrying mechanism, a total-key, and connections operated by said total-key for moving said idle wheels into engagement with said toothed members and said adding-wheels into engagement with said idle wheels.

68. In an adding-machine, the combination with a plurality of toothed members corresponding to the numerical orders, of digit-keys controlling said toothed members, a movable frame carrying idle wheels adapted to be brought into communication with said toothed members, a second pivotal frame carrying adding-wheels adapted to be brought into communication with said idle wheels, means for simultaneously swinging said frames, and means for returning said toothed members to actuate said adding-wheels.

69. In an adding-machine, the combination with a plurality of toothed members corresponding to the numerical orders, of digit-keys for limiting the movement of said toothed members, a frame carrying idle wheels adapted to be brought into communication with said toothed members, a second frame carrying adding-wheels adapted to be brought into communication with said idle wheels, means for moving said frames to connect said wheels and toothed members, and means for releasing said toothed members.

70. In an adding-machine, the combination with a plurality of toothed members corresponding to the numerical orders, of digit-keys for limiting the movement of said toothed members, a movable frame carrying idle wheels, mechanism for moving said frame to bring said idle wheels into communication with said toothed members, an operating-handle for operating said mechanism, a total-key, and connections operated by said total-key for throwing said mechanism out of operation.

71. In an adding-machine, the combination with a plurality of toothed members corresponding to the numerical orders, of digit-keys for limiting the movement of said toothed members, a movable frame carrying idle wheels adapted to be brought into mesh with said toothed members, a second frame carrying adding-wheels adapted to be brought into communication with said idle wheels, an operating-shaft, mechanism for moving said first-named frame and operated by said shaft, said mechanism also moving said second frame to hold said adding-wheels and idle wheels in mesh.

72. In an adding-machine, the combination with a plurality of toothed members corresponding to the numerical orders, of digit-keys controlling said toothed members, adding-wheels normally out of operative connection with said toothed members, a non-rotatable stop for said adding-wheels normally out of the path thereof, means for moving said adding-wheels into operative engagement with said toothed members, and means for moving said stop into the path of said adding-wheels.

73. In an adding-machine, the combination with a plurality of toothed members corresponding to the numerical orders, of digit-keys controlling said toothed members, adding-wheels normally out of operative connection with said toothed members, a non-rotatable stop for said adding-wheels normally out of the path thereof, a total-key, connections operated by said total-key for bringing said adding-wheels into operative connection with said toothed members, and connections also operated by said total-key for moving said stop into the path of said adding-wheels.

74. In an adding-machine, the combination with a plurality of toothed members corresponding to the numerical orders, of digit-keys controlling said toothed members, idle wheels normally out of engagement with said toothed members, adding-wheels normally out of engagement with said idle wheels, a non-rotatable stop for said adding-wheels normally out of the path thereof, means for moving said idle wheels into engagement with said toothed members, means for moving said adding-wheels into engagement with said idle wheels, and means for moving said stop into the path of said adding-wheels.

75. In an adding-machine, the combination with a plurality of toothed members corresponding to the numerical orders, of digit-keys controlling said toothed members, idle wheels normally out of engagement with said toothed members, adding-wheels normally

out of engagement with said idle wheels, a non-rotatable stop for said adding-wheels normally out of the path thereof, a total-key, connections operated by said total-key for moving said idle wheels into engagement with said toothed members, connections operated by said total-key for moving said adding-wheels into engagement with said idle wheels, and means also operated by said total-key for moving said stop into the path of said adding-wheels.

76. In an adding-machine, the combination with indicating devices corresponding to the numerical orders, of digit-keys controlling said indicating devices, adding devices, a total-key for transferring the sum from said adding devices to said indicating devices, and an error-key for retransferring the sum from said indicating devices to said adding devices.

77. In an adding-machine, the combination with a plurality of indicating devices corresponding to the numerical orders, of digit-keys controlling said indicating devices, adding devices, a rotary member for bringing said adding devices into connection with said indicating devices, a total-key, and connections operated by said total-key for throwing said rotary member out of operation.

78. In an adding-machine, the combination with a plurality of indicating devices corresponding to the numerical orders, of digit-keys controlling said indicating devices, adding devices, a member bringing said adding devices into connection with said indicating devices, an operating-handle for actuating said member, a total-key, and connections operated by said total-key to shift said member and render it inoperative.

79. In an adding-machine, the combination with a plurality of indicating devices corresponding to the numerical orders, of digit-keys controlling said toothed members, adding devices, a rotary member for bringing said adding devices into connection with said indicating devices, an operating-handle for operating said rotary member, a member movable longitudinally of said rotary member, a total-key, and means carried by said total-key for actuating said longitudinally-movable member.

80. In an adding-machine, the combination with a plurality of indicating devices corresponding to the numerical orders, of digit-keys controlling said indicating devices, adding devices, a rotary member, actuating mechanism carried by said rotary member for bringing said adding devices into connection with said indicating devices, an operating-handle for actuating said adding devices, and a total-key for throwing said operating connections out of action.

81. In an adding-machine, the combination with a plurality of indicating devices corresponding to the numerical orders, of digit-keys controlling said indicating devices, adding devices, an operating-handle, operating connections actuated by said handle for throwing said adding devices into connection with said indicating devices, a second set of operating connections, and a total-key for actuating said second set of connections and throwing first set of connections out of action.

82. In an adding-machine, the combination with a plurality of indicating devices, corresponding to the numerical orders, of digit-keys controlling said indicating devices, a movable frame, adding devices carried by said frame, a rotary member, a cam on said rotary member for moving said frame to bring said adding devices into connection with said indicating devices, and means for moving said cam out of operation.

83. In an adding-machine, the combination with a plurality of indicating devices corresponding to the numerical orders, of digit-keys controlling said indicating devices, a movable frame, adding devices carried by said frame, a rotary member for moving said frame to bring said adding devices into connection with said indicating devices, an operating-handle for actuating said rotary member, and a total-key for throwing said rotary member out of operative connection with said frame.

84. In an adding-machine, the combination with a plurality of indicating devices corresponding to the numerical orders, of digit-keys controlling said indicating devices, a movable frame, adding devices carried by said frame, a rotary member, an operating-handle actuating said rotary member, a cam carried by said rotary member and cooperating with said frame, said cam being movable longitudinally of said rotary member, and means for moving said cam longitudinally of said member to disengage said cam from said frame.

85. In an adding-machine, the combination with a plurality of indicating devices corresponding to the numerical orders, of digit-keys controlling said indicating devices, a pivotal frame, adding mechanism carried by said frame, a rotary member, a cam carried by said rotary member and cooperating with said frame to move said adding devices into operative connection with said indicating devices, an operating-handle for actuating said rotary member, a second rotary member also cooperating with said frame to move said adding devices into connection with said indicating devices, a total-key, operating connections actuated by said total-key for operating said second rotary member, and operating connections also actuated by said total-key for moving said first rotary member out of operation.

86. In an adding-machine, the combination with a plurality of indicating devices corresponding to the numerical orders, of digit-keys controlling said indicating devices, adding mechanism, operating devices for moving said adding mechanism into connection with said indicating devices, mechanism for throwing said devices out of operation, a total-key for actuating said connections, and an error-key also actuating said connections.

87. In an adding-machine, the combination with a plurality of indicating devices corresponding to the numerical orders, of digit-keys controlling said indicating devices, adding devices, a rotary member, a cam carried by said rotary member for moving said adding devices into engagement with said indicating devices, a total-key, connections operated by said total-key for throwing said cam out of operation, an error-key, and connections operated by said error-key for throwing said cam out of operation.

88. In an adding-machine, the combination with a plurality of indicating devices corresponding to the numerical orders, of adding devices, a total-key, operating connections actuated by said total-key for moving said adding devices into engagement with said indicating devices, and operating connections also actuated by said total-key for releasing said indicating devices.

89. In an adding-machine, the combination with a plurality of indicating devices corresponding to the numerical orders, of adding devices, a total-key, means operated by said total-key for moving said adding devices into engagement with said indicating devices, operating connections also operated by said total-key for releasing said indicating devices, a locking device for said adding devices, and means operated by the return of said total-key for releasing said locking device.

90. In an adding-machine, the combination with a plurality of indicating devices corresponding to the numerical orders, of adding devices, a total-key, means operated by said total-key for moving said adding devices into engagement with said indicating devices, and a pivoted detent controlled by said total-key for holding said adding devices into engagement with said indicating devices.

91. In an adding-machine, the combination with a plurality of indicating devices corresponding to the numerical orders, of adding devices, a total-key, means operated by said total-key for moving said adding devices into engagement with said indicating devices, a pivoted hook for engaging with said adding devices to hold the same in engagement, and a projection carried by said hook and extending in the path of said total-key.

92. In an adding-machine, the combination with a plurality of indicating devices corresponding to the numerical orders, of adding devices, a total-key, a cam carried by said total-key for moving said adding devices into engagement with said indicating devices, a locking device for said adding devices, and means operated by the return of said total-key for releasing said locking device.

93. In an adding-machine, the combination with a plurality of indicating devices corresponding to the numerical orders, of a movable frame carrying idle wheels, a second movable frame carrying adding-wheels, a total-key, connections operated by said total-key to move the first-named frame to connect said idle wheels and indicating devices, means also operated by said total-key to connect said adding-wheels and idle wheels, a detent engaging said second frame, and means operated by the return of said total-key for releasing said detent.

94. In an adding-machine, the combination with a plurality of indicating devices corresponding to the numerical orders, of adding devices actuated by said indicating devices, a total-key, connections operated by said total-key for bringing said adding device into engagement with said indicating devices, an operating-handle, and a locking device operated by the movement of said total-key for preventing the return of said handle.

95. In an adding-machine, the combination with a plurality of indicating devices corresponding to the numerical orders, of adding devices actuated by said indicating devices, a total-key, mechanism operated by said total-key for bringing said adding devices into engagement with said indicating devices, an operating-handle, a locking device operated by the movement of said total-key for preventing the return of said handle, and mechanism operated by the release of said total-key for disengaging said locking device.

96. In an adding-machine, the combination with a plurality of indicating devices corresponding to the numerical orders, of adding devices actuated by said indicating devices, a total-key, mechanism

operated by said total-key for bringing said adding devices into engagement with said indicating devices, an operating-handle, a rotary member actuated by said handle, a detent, and connections between said detent and total-key for moving the former into the path of said rotary member.

97. In an adding-machine, the combination with a plurality of indicating devices corresponding to the numerical orders, of adding devices actuated by said indicating devices, a total-key mechanism operated by said total-key for bringing said adding devices into engagement with said indicating devices, an operating-handle, a rotary member actuated by said handle, a detent, and yielding connections between said detent and total-key for moving the former into the path of said rotary member.

98. In an adding-machine, the combination with a plurality of indicating devices corresponding to the numerical orders, of digit-keys controlling said indicating devices, means for returning said indicating devices, an operating-handle, and a slotted link communicating the movement of said handle to said returning means.

99. In an adding-machine, the combination with a plurality of indicating devices corresponding to the numerical orders, of digit-keys controlling said indicating devices, means for returning said indicating devices, an operating-handle, a rotary member actuated by said handle, and a slotted link connecting said rotary member and returning means.

100. In an adding-machine, the combination with a plurality of indicating devices corresponding to the numerical orders, of digit-keys controlling said indicating devices, means for returning said indicating devices, and locking devices for said returning means.

101. In an adding-machine, the combination with a plurality of indicating devices corresponding to the numerical orders, of digit-keys controlling said indicating devices, means for returning said indicating devices, an operative handle, connection between said handle and returning means, a locking device for said returning means, and connections between said handle and locking device.

102. In an adding-machine the combination, with a plurality of indicating devices corresponding to the numerical orders, of digit-keys controlling said indicating devices, means for returning said indicating devices, an operating-handle, a rotary member actuated by said handle, a slotted link connecting said rotary member and returning means, a locking device for said returning means, and a cam carried by said rotary member for actuating said locking device.

103. In an adding-machine, the combination with a plurality of indicating devices corresponding to the numerical orders, of digit-keys controlling said indicating devices, means for returning said indicating devices, an operating-handle, connections bringing said handle into operative connection with said returning device both on the forward stroke and on the return of said handle, and means for locking said returning device.

104. In an adding-machine, the combination with a plurality of indicating devices corresponding to the numerical orders, of digit-keys controlling said indicating devices, means for returning said indicating devices, an operating-handle, a detent, and yielding connections between said detent and total-key for moving the former into the path of said rotary member.

105. In an adding-machine, the combination with a plurality of indicating devices corresponding to the numerical orders, of digit-keys controlling said indicating devices, means for returning said indicating devices, an operating-handle, and a locking device for said returning means operative upon the forward movement of said handle, said locking devices being inoperative upon the return of said handle.

106. In an adding-machine, the combination with a plurality of indicating devices corresponding to the numerical orders, of digit-keys controlling said indicating devices, means for returning said indicating devices, locking devices for said returning means, an operating-handle, a rotary member actuated by said handle, and a cam carried by said rotary member and operating said locking devices during the forward movement of said handle, said cam being inoperative upon the return of the handle.

107. In an adding-machine, the combination with a plurality of indicating devices corresponding to the numerical orders, of digit-keys controlling said indicating devices, means for returning said indicating devices, an operating-handle, a rotary member actuated by said handle, a slotted link operatively connecting said rotary member with said returning means both on the forward stroke and the return of the handle, a locking device for said returning means, and a cam carried by said rotary member and actuating said locking device during the forward movement of the handle, said cam being inoperative upon the return of the said handle.

108. In an adding-machine, the combination with a plurality of indicating devices corresponding to the numerical orders, of keys controlling said indicating devices, a repeat-key, and a locking device operated by said repeat-key for locking said first-named keys against movement.

109. In an adding-machine, the combination with a plurality of indicating devices corresponding to the numerical orders, of operating-keys controlling said indicating devices, a comb locking said operating-keys, a repeat-key, means operated by said repeat-key for actuating said comb, a total-key, means actuated by said total-key for actuating said comb, an operating-handle, and connections operated by said handle for operating said comb.

110. In an adding-machine, the combination with a plurality of adding devices, of operating-keys controlling said adding devices, locking devices coöperating with said keys, and means operated by the depression of one of said keys for moving the locking devices on one side thereof in one direction and the locking devices on the other side thereof in the other direction to lock all the remaining keys.

111. In an adding-machine, the combination with a plurality of indicating devices corresponding to the numerical orders, of operating-keys controlling said indicating devices, locking devices coöperating with said keys, and means operated by the depression of one of said keys for moving the locking devices on one side thereof in one direction and the locking devices on the other side thereof in the other direction to lock all the remaining keys.

112. In an adding-machine, the combination with a plurality of indicating devices corresponding to the numerical orders, of operating-keys for said indicating devices, locking devices for said keys consisting of a plurality of sets of connected plates, projections carried by said sets and interlocking, and means carried by said keys for moving said plates.

113. In an adding-machine, the combination with a plurality of indicating devices corresponding to the numerical orders, of operating-keys therefor, a plurality of sets of connected plates, interlocking devices between said sets, inclined faces carried by said plates, and pins carried by said keys for engaging with said inclined faces.

114. In an adding-machine, the combination with adding devices, of operating-keys for said adding devices, locking-plates arranged between said keys and interlocking connections between said plates, whereby the depression of two keys at the same time is prevented.

115. In an indicating device for adding-machines, the combination with a toothed segment, of feeding-dogs coöperating with said segment, a track adjacent to said toothed segment, and means for moving said segment to bring said dogs into engagement with said track.

116. In an indicating device for adding-machines, the combination with a toothed segment yielding laterally, of an indicator adjacent to said toothed member, a pointer carried by said toothed member, feeding-dogs normally in engagement with said toothed member, and means for disengaging said dogs by the lateral movement of said segment.

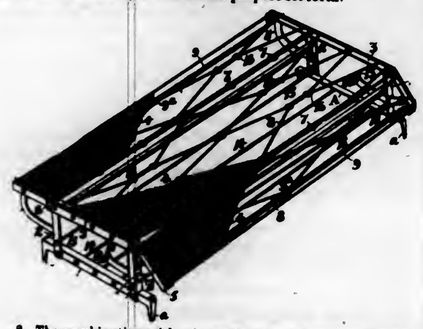
117. In an indicating device for adding-machines, the combination with a member movable step by step, of an arm in the path of said member, a hammer pivoted to said arm, a bell adapted to be struck by said hammer, connections between said arm and hammer for moving the latter, and means for throwing said connections out of operation.

118. In an indicating device for adding-machines, the combination with a member movable step by step, of an arm in the path of said member, a second arm pivoted to said first-named arm, a dog pivoted to said second-named arm and engaging with said first-named arm, means for releasing said dog, a hammer carried by said second arm, and a bell adapted to be struck by said hammer.

119. In an adding-machine, the combination with adding mechanism, of printing devices therefor, a platen coöperating with said printing devices, a feed-dog for said platen, an arm connected with said feed-dog, an adjustable block in said arm, a rock-shaft, a link connecting said adjustable block and rock-shaft, and means for actuating said rock-shaft from said adding mechanism.

811,921. EXTENSION-COUCH. JOHN HOST, San Francisco, Cal. Filed July 27, 1904. Serial No. 218,208.

Claim.—1. The combination with a frame bearing a stationary locking-shoulder, and a swinging leaf pivoted thereon, of a bar-form locking-link pivoted at one end on said leaf and provided at its lower edge near its inner end with a narrow notch, the lower edge of the inner end of said link riding on said locking-shoulder when the leaf is raised above the horizontal, thereby to elevate the notch so that the acquired momentum of the parts and inertia of the link will be sufficient to cause the notch to clear the locking-shoulder when the leaf is dropped, substantially as and for the purpose set forth.



2. The combination with a frame bearing a stationary locking-shoulder, and a swinging leaf pivoted thereon, of a bar-form locking-link pivoted at one end on said leaf and having a straight lower edge provided with a notch near its inner end, the lower edge of said inner end riding on the locking-shoulder when the leaf is raised above the horizontal position, whereby the notch is elevated sufficiently to clear the locking-shoulder when the leaf is dropped from an abnormally high position, substantially as and for the purpose set forth.

3. An extension couch-frame comprising end base-pieces and vertical posts and top bars, extension-bars pivoted to the ends of the top bars capable of being opened or closed about the pivots, elastic cables extended between the ends of the main portion and of the extensions, and means connecting the exterior cables with the outer bars of the extensions to maintain a transverse tension of the cables.

4. An extension-couch comprising end base-pieces and vertical posts and top bars rigid therewith, extension-bars pivoted at the ends of the top bars, a bed-bottom extended between the ends of the main portion and of the extensions, and having the side edges of said bottom connected with the rigid outer bars of the extensions to maintain a transverse tension of said bottom.

5. An extension-couch comprising end base-pieces and vertical posts and top bars rigid therewith, extension-bars pivoted at the ends of the top bars, and having bars along their longitudinal edges, and a flexible bed-bottom extended between the ends of the main portion and of the extensions, and having the side edges connected with the said side bars of the extensions whereby a transverse tension of said bottom is maintained.

6. An extension-couch comprising end base-pieces and vertical posts and top bars rigid therewith, extension-bars pivoted at the ends of the top bars, and having rigid bars along their sides, a bed-bottom extended between the ends of the main portion and of the extensions, and having its side edges connected to the rigid bars of said extensions whereby a transverse tension of said bottom is maintained, and parallel rods extending from base-piece to base-piece and fixed thereto and serving as a holder for a supplemental mattress.

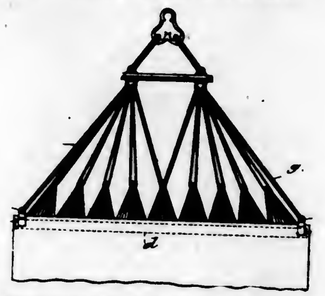
7. A couch-frame comprising angle-iron base-pieces and angle-iron posts and top bars rigid therewith, angle-iron extensions pivoted to the ends of the top bars, said posts provided with slots, and braces pivoted to the extensions and slidable through the slots of the posts said braces having their inner ends provided with notches and the portion beyond said notches made higher than the portion anterior to the notch for the purpose herein described.

8. An extension-couch comprising main end frames, side extensions hinged to the top bars of said end frames, braces with locking-notches to engage with slots in the main frame and retain the extensions in a horizontal position, elastic cables and superposed woven-wire fabric extended between the ends of the main portion and of the extensions, and centrally-disposed hooks or links by which the exterior cables may be connected with the rigid outer bar of the extension to maintain a transverse tension of the cables.

9. An extension-couch consisting of main end frames and connecting bars and rods, extension-frames pivoted to the top bars of the main frame, notched braces by which the extensions may be retained in an elevated position, independent elastic wire-fabric sections by which the main body and the extensions are covered, and clips by which the contiguous and parallel edges of said sections are united.

10. An extension-couch consisting of main end frames, extension-frames pivoted to the end frames at points below the upper edges whereby said upper edges are separated when the extensions are closed and brought together when the extensions are raised to a horizontal position, independent woven-wire mattress fabric sections stretched upon the main top frame and extensions, and clips by which the contiguous parallel edges of said fabric are united.

811,922. LOOP FOR HAMMOCKS. HERMAN L. HOHLFELD, Philadelphia, Pa. Filed Sept. 25, 1905. Serial No. 280,054.



Claim.—1. In a device of the character described, in combination with a spreader-bar of a hammock, of a loop, consisting of a plate presenting a broad bearing-surface to said hammock and prongs adapted to pass through said spreader-bar so as to connect the hammock and plate to said bar.

2. In a device of the character described, in combination with a spreader-bar of a hammock, of a loop, consisting of a plate, means integral with said plate adapted to pass through said bar and hammock-cloth surrounding the same so as to connect said plate and hammock-cloth to said bar.

3. In a device of the character described, in combination with a spreader-bar of a hammock, of a loop, consisting of a plate having an eye and prongs, means adapted to be engaged by said prongs, said prongs adapted to pass through said spreader-bar and hammock-cloth to connect the same with each other, when bent at the free ends over said means.

4. In a device of the character described, in combination with a spreader-bar of a hammock and its cords, of a loop, consisting of a plate having an eye and prongs, a locking-bar adapted to be engaged by said prongs, said prongs adapted to pass through said spreader-bar and hammock-cloth to connect the same with each other, when bent at the free ends over said locking-bar, and said eye adapted to receive said cords to assist in the support of said hammock-cloth.

5. In a device of the character described, in combination with a spreader-bar of a hammock, of a loop, consisting of a bent plate having prongs laterally projecting therefrom, a locking-bar having a groove adapted to be engaged by said prongs, said prongs adapted to pass through said spreader-bar and cloth of said hammock to connect the same with each other by clamping both the plate and locking-bar to the spreader-bar, when bent over and into the groove of said locking-bar.

6. In a device of the character described, in combination with a spreader-bar of a hammock and its cords of a loop, consisting of a bent plate having an eye and staples or prongs laterally projecting therefrom, said plate adapted to partly surround said spreader-bar, a locking-bar having a groove adapted to be engaged by the staples, said staples adapted to pass through said spreader-bar and cloth of said hammock to connect the same with each other by clamping both the plate and locking-bar to said spreader-bar when bent over and into the groove of said locking-bar, and said eye adapted to receive said cords to assist in the support of said hammock-cloth by said plate, prongs and locking-bar.

811,923. LOADING, CONVEYING, AND DUMPING DEVICE. BENJAMIN HOWLAND, Pontiac, Mich. Filed Aug. 20, 1904. Serial No. 220,205.

Claim.—1. In a combined loading conveying and dumping device, the combination of a body mounted upon traveling wheels, a motor mounted on the front end of said body, a windlass to be operated by said motor, means for gathering a load operated by said windlass, a bridge pivotally attached to the rear end of said traveling

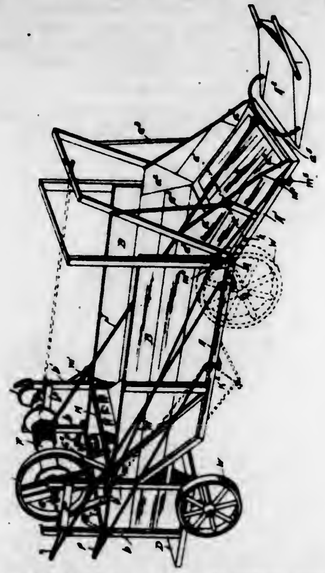
device adapted to operate as a brace against the resistance of the loading mulk, and to be raised when loaded, substantially as described.

2. In a device of the character described, the combination of a receptacle and a powder-ejecting bag within the pocket, and having

ferent lengths and located one above the other, having their ends

811,928. SAFETY-STARTING DEVICE FOR ELECTRIC MOTORS.

device adapted to operate as a brace against the resistance of the loading pulls, and to be raised when loaded, substantially as described.



2. In a combined loading, conveying and dumping device, the combination of a body adapted to travel upon wheels, motor means carried thereby adapted to draw the material to be loaded thereonto, a bridge pivoted to the end adapted to serve as a brace, and means connecting said bridge and said motor means whereby the bridge may be hauled up and held in position to support a part of the load during the movement of the vehicle, substantially as described.

3. In a combined loading and conveying and dumping device, the combination of a body adapted to travel upon wheels, means mounted thereon whereby the material to be loaded can be drawn into and dumped upon the floor thereof, a bridge adapted to form a brace and also as means for controlling the passage thereover of the loading means, the bottom of said device and said bridge having dump-boards and means for controlling the same, substantially as described.

4. In a combined loading conveying and dumping device, in combination with the body mounted upon traveling wheels, a bridge pivotally attached to the rear end of said body, means for raising and lowering the bridge, and a pivoted dump-board located in said bridge, affording when dropped an inclination of greater angle than the bridge when the same is dropped, and means for operating said dump-board, substantially as described.

5. In a combined loading, conveying and dumping device, the combination of a body member adapted to travel upon wheels, a bridge member pivoted to one end of said body member, dump-boards pivoted to and forming a part of the floor portion of said members, said boards being so adjusted that one end is raised while the other descends under the influence of the load, and means carried by said body portion whereby said boards may be raised and lowered, substantially as described.

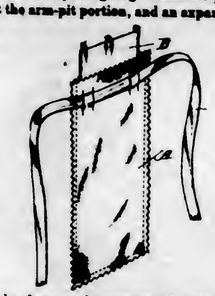
811,924. **DEVICE FOR APPLYING POWDER TO THE PERSON.** OTTO H. HUMAN, Jersey City, N. J. Filed Aug. 10, 1905. Serial No. 273,683.

Claim.—1. An article of personal wear comprising a pocket or receptacle and an upwardly-discharging powder-bag therein provided with an expansion-spring.

2. A powder-bag adapted to discharge upwardly and having a partition between its ends and an expansion-spring below the said partition.

3. A powder-bag adapted to discharge upwardly and having a pervious partition between its ends and an expansion-spring within the bag below said partition.

4. An article of wearing-apparel provided with a pocket or receptacle and a powder-ejecting bag within the pocket, and having its discharge at the arm-pit portion, and an expansion-spring.



5. An article of personal wear formed with a pocket at its arm-pit portion and a powder-ejecting bag within the pocket and adapted when compressed to discharge the powder upwardly.

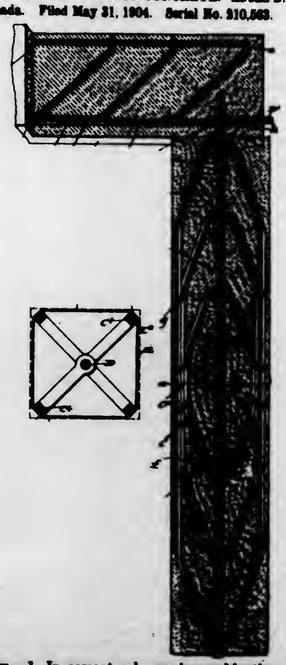
811,925. **FASTENING DEVICE.** ISAAC JACKSON, Glossop, England. Filed May 17, 1905. Serial No. 260,917.

Claim.—1. A fastener comprising a relatively thin plate adapted to be secured or released by a rotary motion, said plate having openings for engagement with the lugs of a key, that wall of at least one of the openings which is to be engaged by the key-lug being undercut, substantially as described.

2. A fastener comprising a relatively thin plate adapted to be secured or released by a rotary motion, said plate having openings therethrough provided with undercut walls, substantially as described.

3. A fastener having openings 4, and bent up at the edge between the openings to form rounded ribs, substantially as described.

811,926. **REINFORCED CONCRETE.** EDGAR B. JARVIS, Toronto, Canada. Filed May 31, 1904. Serial No. 210,563.



Claim.—1. In cement columns in combination a plurality of trusses each consisting of a central rod and a plurality of bars of different lengths and located one above the other, having their ends bent obliquely and converging to the central rod said rod passing through the ends of all the bars as and for the purpose specified.

2. In cement structures, in combination a beam having in it a truss consisting of a central rod and a plurality of bars of different lengths, located one above the other having their ends bent obliquely, a column containing a plurality of like trusses secured to the central rod and a link-bar connecting the trusses in the beam and column as and for the purpose specified.

3. A strengthening truss or device for concrete structures comprising a frame composed of a plurality of sets of radially-arranged bars, each set consisting of a plurality of straight portions of different lengths secured together and having inwardly-inclined portions connected to the inwardly-inclined portions of the other sets, and a wire mesh encircling the sets of bars and in contact with the outer surface of the straight portions thereof, substantially as described.

811,927. **REINFORCED TRUSS FOR CONCRETE.** EDGAR B. JARVIS, Toronto, Canada. Filed Dec. 15, 1904. Serial No. 236,967.

Claim.—1. In a reinforcing-truss for concrete, the combination with the beam having a plurality of openings, of a bar extending underneath the beam and upwardly and outwardly through the openings and having obliquely-arranged ends oppositely inclined toward the ends of the beam as and for the purpose specified.

2. In a reinforcing-truss for concrete, the combination with the beam having a plurality of openings, of a bar extending underneath the beam and upwardly and outwardly through the openings and having obliquely-arranged ends oppositely inclined toward the ends of the beam and provided with spurs as and for the purpose specified.

3. In a reinforcing-truss for concrete, the combination with the I-beam having a plurality of openings, of a bar extending underneath the beam and upwardly and outwardly through the openings and having obliquely-arranged ends oppositely inclined toward the ends of the beam as and for the purpose specified.

4. In a reinforcing-truss for concrete, the combination with the beam having a plurality of openings, of a plurality of bars extending underneath the beam and upwardly and outwardly through the openings, the shortest being located in the center, each of the bars having obliquely-arranged ends extending through the openings and oppositely inclined toward the ends of the beam as and for the purpose specified.

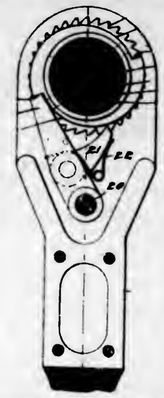
5. In a reinforcing-truss for concrete, the combination with the beam having a plurality of openings, of a plurality of bars extending underneath the beam and upwardly and outwardly through the openings, the shortest being located in the center, each of the bars having obliquely-arranged ends extending through the openings and oppositely inclined toward the ends of the beam and separating-blocks located between the portions of the bars extending underneath the beam as and for the purpose specified.

6. In a reinforcing-truss for concrete, the combination with the main bar or beam, of supplemental bars suitably held thereto and provided with obliquely-arranged ends, the said bars increasing in cross-sectional area from the center outwardly as and for the purpose specified.

7. In a reinforcing-truss for concrete, the combination with the beam having a plurality of openings, of a plurality of bars extending underneath the beam and upwardly and outwardly through the openings, the shortest being located in the center, each of the bars having obliquely-arranged ends extending through the openings and oppositely inclined toward the ends of the beam and separating-blocks located between the portions of the bars extending underneath the beam, the said separating-blocks and ends of the bars being so arranged as to provide openings between the bars themselves, and the bars and the beam, and ends of the bars as and for the purpose specified.

8. In a reinforcing-truss for concrete, the combination with the beam having a plurality of openings, of a bar extending underneath the beam and upwardly and outwardly through the openings and having obliquely-arranged ends oppositely inclined toward the ends of the beam and held in place by the contact of the upper and lower sides of the obliquely-shaped ends on the edges of the openings as and for the purpose specified.

811,928. **SAFETY STARTING DEVICE FOR GAS-ENGINES.** ALVIN S. JOHNSON, Minneapolis, Minn., assignor of one-fourth to F. J. Moore, Minneapolis, Minn. Filed May 14, 1904. Serial No. 207,893.



Claim.—1. The combination, with a gas-engine crank-shaft, of an arm loosely mounted thereon, mechanism for locking said arm on said shaft when it is turned in one direction, mechanism for tripping said locking mechanism upon the reverse movement of said shaft and arm, and means for holding said locking mechanism in its unlocked or inoperative position after being tripped, for the purpose specified.

2. In a device of the class described, the combination, with a crank-shaft having stops or shoulders, of a loosely-mounted crank-arm, a pawl thereon arranged to engage said shoulders when said arm is turned in one direction, mechanism for tripping said pawl upon the reverse movement of said arm and shaft, and a spring-pressed pin arranged to drop behind said pawl and hold it in its unlocked position.

3. The combination, with an automobile-car body, of a crank-shaft projecting therethrough, two sleeves arranged on said shaft, one within the other, the outer sleeve being fixed and having a series of external ratchet-teeth, the inner sleeve being connected with said shaft and provided with suitable stops or shoulders, a crank-arm loosely mounted on said sleeves, a pawl pivoted on said arm and adapted to bear upon said movable sleeve and engage said shoulders when said arm is turned in one direction, and a click pivoted on said pawl between its pivot and point of engagement with said shoulders and engaging the teeth of said ratchet to trip said pawl when said shaft and arm are turned in the other direction.

811,929. **RAILWAY-TRACK-GRADING MACHINE.** EDWARD M. JONES, St. Louis, Mo. Filed May 1, 1905. Serial No. 258,417.

Claim.—1. In a railway-track-grading machine, a car, a moldboard carried thereby, and means carried by the car whereby the moldboard is shifted from one side of the car to the other; substantially as specified.

2. In a railway-track-grading machine, a car, a moldboard carried thereby, and mechanism connected to and actuated by one of the car-axles whereby the elevation of the moldboard is changed so as to regulate its horizontal travel; substantially as specified.

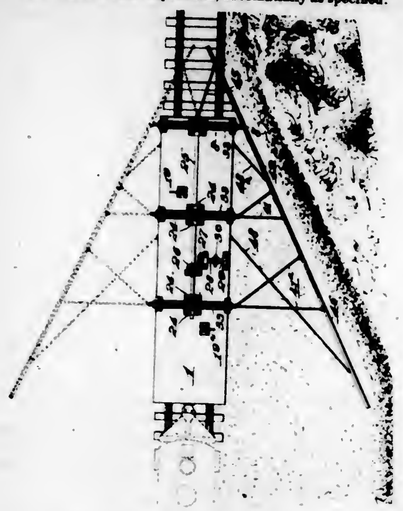
3. In a railway-track-grading machine, a car, a sectional moldboard carried thereby, and connections between the car and moldboard whereby the latter is shifted from one side of the car to the other, substantially as specified.

4. In a railway-track-grading machine, a car, a moldboard carried thereby, and adapted to scrape the ground on each side of the car; connections between the car and the moldboard whereby the latter is shifted from one side of the car to the other and suitable gearing from certain of the car-axles to the shifting connections for operating the latter, substantially as specified.

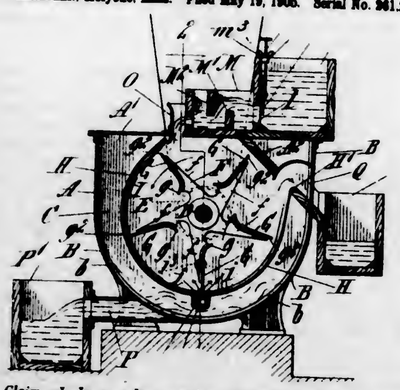
5. In a railway-track-grading machine, a car, a sectional moldboard connected to the said car; means whereby said sectional moldboard is shifted from one side of the car to the other, and suitable braces extending from the moldboard to the side of the car, substantially as specified.

6. In a railway-track-grading machine, a car, a moldboard connected to said car, means whereby said moldboard and its connec-

tions are shifted from one side of the car to the other; braces between the moldboard and car; suitable gearing from certain of the car-axles to the shifting connections, and means whereby this gearing is thrown into or out of operation, substantially as specified.



811,930. PAPER-PULP-ASSORTING APPARATUS. BERNHARD KIELHORN, Holyoke, Mass. Filed May 19, 1905. Serial No. 261,264.



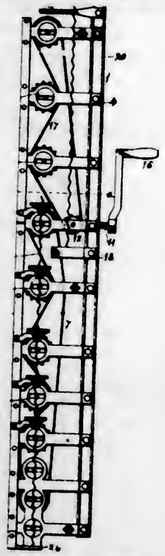
Claim.—1. In a pulp-assorting apparatus, the combination with a casing having an outlet-opening, and a chamber-inclosing screen, within and separated from the walls of the casing, and having a pulp-inlet opening and a pulp-outlet opening, of a centrifugal wheel within said screen, having the blades or wings thereof at their portions toward the axis of their revolution inclined forwardly relatively to the direction of rotation of said wheel.

2. A pulp-assorting apparatus consisting of a casing having an outlet-opening and a chamber-inclosing screen within and separated from the walls of the casing, and having a pulp-inlet opening and a pulp-outlet opening, and also having an air-entrance opening leading through the end of the casing and communicating into the interior of the chamber within the screen, of a centrifugal wheel within said screen, operable to force the pulp outwardly against the said screen, and means for rotating the said wheel.

3. In a pulp-assorting apparatus, the combination with an approximately cylindrical screen-shell having a pulp-entrance opening at its upper portion and to one side of its axis, and having a pulp-residue-outlet opening at an upper portion thereof sidewise opposite from said entrance-opening, of a fan-wheel rotatable within the screen-inclosed chamber, a chamber-inclosing casing outside of the said screen having a pulp-opening leading from a lower portion thereof, and a water-supply pipe extending longitudinally within the last-named chamber and having jet-holes directed through the bottom of the screen.

4. A pulp-assorting apparatus comprising a casing having an outlet-opening, and a chamber-inclosing screen, within and separated from the walls of the casing, and having pulp inlet and outlet openings leading to and from said screen-inclosed chamber, an axially horizontal centrifugal wheel within said screen, and a water-supply pipe ranging horizontally and in proximity to the screen, and having jet-holes directed substantially toward the wheel-axis and for delivering water under pressure, and distributed, into the screen-inclosed chamber.

811,931. FENCE-MAKING MACHINE. WALTER C. KINGARD, St. Charles, Ill. Filed Mar. 26, 1906. Serial No. 308,402.



Claim.—1. In a portable fence-making machine, the combination of a suitable frame, twisters supported by the frame, and a series of stay-wire guides, each guide comprising a movable section.

2. In a portable fence-making machine, the combination of a suitable frame, twisters supported by the frame, and a series of stay-wire guides, each guide comprising two movable sections.

3. In a portable fence-making machine, the combination of a suitable frame, twisters supported by the frame, a series of stay-wire guides, each comprising two movable sections, and stops limiting the closing movement of the section.

4. In a portable fence-making machine, the combination of a suitable frame, twisters supported by the frame, a series of stay-wire guides, each guide comprising two movable sections, and stops limiting the opening movement of the sections.

5. In a portable fence-making machine, the combination of a suitable frame, twisters supported by the frame, a series of stay-wire guides, each guide comprising two movable sections, a stop limiting the closing movements and stops limiting the opening movements of the sections.

6. In a portable fence-making machine, the combination of a suitable frame, twisters supported by the frame, and a series of stay-wire guides, each guide comprising a self-closing section.

7. In a portable fence-making machine, the combination of a suitable frame, twisters supported by the frame, and a series of stay-wire guides, each guide comprising two self-closing sections.

8. In a portable fence-making machine, the combination of a suitable frame, twisters supported by the frame, and a series of stay-wire guides, each guide comprising a movable section having its upper portion weighted.

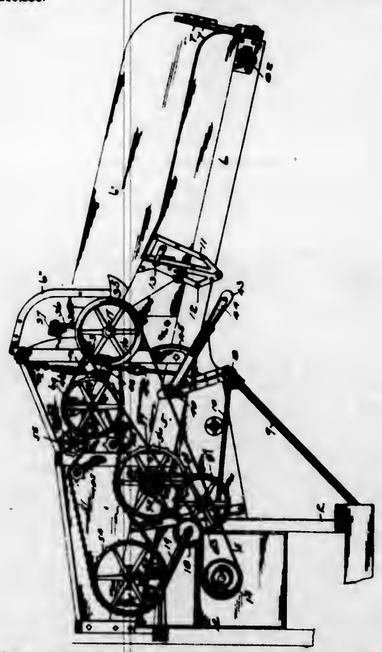
9. In a portable fence-making machine, the combination of a suitable frame, twisters supported by the frame, and a series of stay-wire guides, each guide comprising two movable sections having their upper portions weighted.

10. In a portable fence-making machine, the combination of a suitable frame, twisters supported by the frame, a series of stay-wire guides, each guide comprising two movable sections having their meeting edges curved outwardly.

11. In a portable fence-making machine, the combination of a suitable frame, twisters supported by the frame, each twister composed of ends provided with transverse openings, a center division having a transverse opening and a bar across the opening.

12. In a portable fence-making machine, the combination of a suitable frame, twisters supported by the frame, a support for the frame having a series of adjustable open loops whereby the openings may be closed.

811,932. BAND-CUTTER AND FEEDER. PETER R. KRAMER and GEORGE B. WILSON, Stillwater, Minn. Filed May 31, 1904. Serial No. 210,330.



Claim.—1. In a band-cutter and feeder, the combination, with a casing, of a bundle-carrier, a shaft 83 provided near the discharge end of said carrier, a series of curved arms mounted on said shaft, a driven sprocket-wheel, a clutch mechanism connecting said wheel and said shaft, pressure-plates arranged to overhang said shaft between said arms, and mechanism including a spring-pressed adjustable arm connecting said pressure-plates with said clutch device, whereby when the accumulation of grain on said plates exceeds a certain amount said clutch will be operated to stop said shaft and retarding-arms, substantially as described.

2. In a band-cutter and feeder, the combination, with a casing, of a shaft 83 mounted therein, retarding-arms carried by said shaft, a clutch connected with said shaft, a series of pressure-plates arranged to extend between said retarding-arms, a shaft 93 whereon said plates are mounted, a crank-arm 94 secured on said shaft 93, an arm 96 pivoted on said shaft 93 and having an adjustable connection with said arm 94, a spring-pressed rod connected with said arm 96, and an arm 98 connecting said arm 96 and said clutch and arranged to operate the same to stop said retarding device when the weight of the grain on said plates exceeds a predetermined amount.

3. In a band-cutter and feeder, the combination, with a casing, of a bundle-carrier, a shaft 17 provided above the same, a series of band-cutting knives carried by said shaft, a pulley 16 and a disk 23 secured on said shaft, a disk 24 loosely mounted on said shaft and having an inwardly-turned flange 26, arms 27 pivoted on said disk 23 and carrying friction-blocks 28, weights 30 carried by said arms, a rod 29 connecting one arm on one side of its pivot with the other arm on the opposite side of its pivot, a spring connected with one of said arms and arranged to oscillate them and withdraw said blocks from contact with said flange, but allowing them to be thrown outward by centrifugal force to engage said flange, substantially as described.

4. The combination, with a carrier and its shaft, of a rock-shaft having a series of arms overhanging said carrier, a driving mechanism connected with said carrier-shaft, operative connections provided between said rock-shaft and said driving mechanism for disconnecting the latter when said arms are raised by the pressure of the grain, and a continuously-operating mechanism in constant engagement with said carrier-shaft for operating the same at a slower speed after the disconnection of said driving mechanism.

5. The combination, in a band-cutter and feeder, with a bundle-carrier and its shaft 57, of a rock-shaft 69 arranged above said carrier and having a series of arms overhanging the same, a clutch mechanism provided on said shaft 57, operative connections provided between said clutch mechanism and said shaft 69, a driven sprocket-wheel 56 loosely mounted on said shaft 57, and means for driving said shaft 57 from said wheel when said clutch mechanism is disconnected by the movement of said rock-shaft.

6. In a band-cutter and feeder, the combination, with a casing, of a carrier having a shaft 57, a rock-shaft 69 provided above said carrier, and having a series of arms 73 arranged to overhang the same, a clutch mechanism provided on said shaft 57 and operatively connected with said shaft 69 and arranged to be alternately set and released by the rocking of said shaft 69, a flanged hub 74 and a sprocket 75 secured on said shaft 57, said hub having projections 76, a sprocket-wheel 56 loosely mounted on said shaft 57, dogs 77 secured on said wheel and adapted to engage said projections, and means for driving said sprocket 56.

7. In a band-cutter and feeder, the combination, with a casing, of a bundle-carrier and its shaft, and means for driving the same, a rock-shaft 69 arranged above said carrier and provided with a series of arms overhanging said carrier, a clutch mounted on said bundle-carrier shaft and comprising a fixed and a movable driven member, a bell-crank lever 65 arranged to engage the movable member of said clutch, a rod 67 having one end connected to said bell-crank, a crank-arm 68 mounted on said shaft 69 and connected to the other end of said rod, and a spring 70 provided on said rod 67 and normally under compression to hold the members of said clutch in their locked position, substantially as described.

8. The combination, with a carrier and its shaft and a driving mechanism connected therewith, of means operated by the pressure of the grain for temporarily disconnecting said driving mechanism from said shaft, and a continuously-operating mechanism in constant engagement with said shaft for operating the same at a slower speed after the disconnection of said driving mechanism.

9. The combination, with a carrier and its shaft and a driving mechanism connected therewith, of means arranged to be operated by the pressure of grain for disconnecting said driving mechanism from said shaft when an overplus of grain accumulates on said carrier, and a continuously-operating mechanism in engagement with said shaft and normally idle by reason of the greater speed of the shaft but becoming operative to drive said shaft when it is disconnected from said driving mechanism.

10. The combination, with a carrier and its shaft and a driving mechanism connected therewith, of means operated by the pressure of the grain for disconnecting said driving mechanism and releasing said shaft, a continuously-operating sprocket-wheel and a ratchet mechanism interposed between said wheel and shaft and normally idle but arranged to engage and drive said shaft when it is disconnected from said driving mechanism.

11. The combination, with a carrier and its shaft and driving mechanism connected therewith, of means operated by the pressure of the grain for disconnecting said driving mechanism from said shaft, a continuously-operating sprocket-wheel loosely mounted on said shaft, and dogs carried by said wheel and arranged to engage projections on said shaft and drive the same when it is disconnected from said driving mechanism.

811,933. PROTECTIVE ATTACHMENT FOR INFANTS' HIGH CHAIRS. JOHN KUSEL, Chicago, Ill. Filed May 31, 1905. Serial No. 262,894.

Claim.—1. In combination with an infant's high chair having side arms, a swinging guard provided with a cross guard-board pivoted to the back of the chair and adapted when lowered to rest upon the side arms and a guard post or pin rigidly secured at its upper end, and depending from the cross guard-board to the seat of the chair,

and means for locking the lower end of the guard post or pin to the seat of the chair, substantially as described.

8. An injector-burner comprising a body having an oilway terminating in an outlet having a concave bottom, a partition, an air-

terminating above the plane of the top wall of the steam-discharge

and means for locking the lower end of the guard post or pin to the seat of the chair, substantially as described.

2. The combination with an infant's high chair having side arms, a swinging guard provided with side arms adapted when lowered to rest upon the side arms of the chair and pivoted to the back of the chair and a cross guard-board secured to the arms, a depending protective post or pin rigidly secured at its upper end to the lower face of the cross guard-board and adapted to have its lower end inserted into a socket in the bottom of the chair and a spring-lock for automatically locking the guard post or pin at its lower end when inserted into the socket, substantially as described.

811,934. **AUTOMATIC PACKING.** EDWARD S. LEA and JULIUS DEGEN, Trenton, N. J., assignors, by mesne assignments, to Lea-Degen Pump Company, Trenton, N. J., a Corporation of New Jersey. Filed May 6, 1905. Serial No. 259,150.

Claim.—1. A construction for packing revoluble shafts against leakage of fluid on either side thereof, consisting of the shaft, a sleeve surrounding said shaft, and fixed to the shaft a collar thereon, a flexible packing element having angularly-disposed walls, one of which is adapted to press against said collar, and the other against a surface at right angles to the collar and parallel to the shaft.

2. A construction for packing revolving shafts against the leakage of fluid on either side thereof, consisting of a sleeve surrounding the shaft, and fixed to the shaft a collar rotating with the shaft, a flexible packing element having right-angularly-disposed walls, one of which may be pressed against said collar, and the other against a surface at right angles to said collar and parallel to the shaft, and means to press said walls of said element in both directions against both surfaces.

3. A construction for packing revolving shafts against the leakage of fluid on either side thereof, consisting of a sleeve surrounding the shaft, and fixed to the shaft a collar rotating with the shaft, a flexible packing element having right-angularly-disposed walls, one of which may be pressed against said collar, and the other against a surface at right angles to said collar and parallel to the shaft, and a spring exerting its force upon the packing element to press it against the collar.

4. A construction for packing revolving shafts against the leakage of fluid on either side thereof, consisting of a sleeve surrounding the shaft, and fixed to the shaft a collar rotating with the shaft, a flexible packing element having right-angularly-disposed walls, one of which may be pressed against the collar and the other against a surface at right angles to the collar and parallel to the shaft, a member fitting in the angular recess of the packing elements and means to press the packing and the member against or toward the collar.

5. A construction for packing rotating shafts against the leakage of fluid on either side thereof, consisting of a sleeve surrounding the shaft, and fixed to the shaft collars rotating with the shaft, flexible packing elements each having right-angularly-disposed walls one of each of which may be pressed against the collars in opposite directions and the other against surfaces at right angles to said collars and parallel to the shaft, and means to create the pressure.

6. A construction for packing revolving shafts against the leakage of fluid on either side thereof, consisting of a sleeve surrounding said shaft, and fixed to the shaft collars rotating with the shaft, flexible packing elements having right-angularly-disposed walls one of each of which may be pressed against the collars and the others against surfaces at right angles to said collars and parallel to the shaft, members fitting in the angular recess of said elements, and a spring to press said elements and members in opposite directions against and toward the collars.

7. A construction for packing revolving shafts against the leakage of fluid on either side thereof, consisting of a sleeve surrounding the shaft, and fixed to the shaft collars rotating with the shaft, a flexible packing element having right-angularly-disposed walls one of which may be pressed against said collars and the other against surfaces at right angles to said collars and parallel to the shaft, a duct through which pressure may be forced against said packing elements to force them to a packing position.

811,935. **INJECTOR-BURNER.** LOUIS K. LEARY, Los Angeles, Cal. Filed Sept. 8, 1903. Renewed June 13, 1905. Serial No. 265,066.

Claim.—1. An injector-burner comprising a body provided with an oilway terminating in two parallel discharge slots or ducts, the bottom of said way being concaved at its communication into one of said slots or ducts, and a steamway, said ducts arranged beyond the discharge-opening of said steamway and discharging across the plane of discharge therefrom.

2. An injector-burner comprising a body provided with an oilway terminating in a wide concave-bottomed discharge-outlet, and a recessed plate affixed to said body and forming a steamway terminating in a thin wide discharge-slot, and means for directing the oil from said discharge-outlet right angularly across the plane of discharge from said steamway.

3. An injector-burner comprising a body provided with an oilway, a recessed plate affixed to said body and forming a steamway terminating in a thin wide discharge-slot, and an end block or end wall for said body and forming a downward extension of said oilway adapted to project the oil downwardly across the plane of the steam-discharge, the bottom of said oilway being depressed at its center, where it communicates into said downward extension.

4. An injector-burner comprising a body provided with an oilway terminating in two discharge slots or ducts, and with a steamway terminating in a thin wide discharge-outlet, one of said oil-discharge ducts communicating into the steam-discharge slot, the other duct discharging across the plane of discharge from said steam-discharge slot.

5. An injector-burner comprising a body comprising an oilway terminating in two discharge slots or ducts separated by an inwardly-projecting lip or partition extending above one of said ducts, and with a steamway terminating in a thin discharge-slot, one of said oil-ducts communicating into the steam-discharge slot, the other duct discharging across the plane of discharge from said steam-discharge slot.

6. An injector-burner comprising a body having an oilway terminating in two discharge slots or ducts separated by a lip or partition forming the floor of the outward duct, said lip or partition having a concave upper face, the floor of the other duct also concaved, and said body provided with a steamway terminating in a discharge-slot adapted to impinge steam against the oil from said ducts.

7. An injector-burner comprising a body having an oilway terminating in an outlet having a concave bottom, a partition or lip superposed above said bottom and having a concaved upper face, a downwardly-projecting wall forming a discharge-slot between such wall and the end of said concaved bottom, and an outer wall forming a second discharge-slot, said body provided with a steamway discharging across the plane of discharge of said oil-discharge ducts.

8. An injector-burner comprising a body having an oilway terminating in an outlet having a concave bottom, a partition or lip superposed above said bottom and having a concaved upper face, a downwardly-projecting wall forming a discharge-slot between such wall and the end of said concaved bottom, and an outer wall forming a second discharge-slot, and a recessed plate affixed to said body and forming a steamway, the front wall of the recess of said plate extended upward to form a thin wide discharge-slot discharging at an angle to the plane of discharge from said oil-ducts.

9. An injector-burner comprising a body having an oilway terminating in an outlet having a concave bottom, a partition or lip superposed above said bottom and having a concaved upper face, a downwardly-projecting wall forming a discharge-slot between such wall and the end of said concaved bottom, and an outer wall forming a second discharge-slot, and a recessed plate affixed to said body and forming a steamway, the front wall of the recess of said plate extended upward to form a thin wide discharge-slot, the first-named oil-slot discharging into said steam-slot, and the second oil-duct discharging across the plane of discharge of said steam-discharge slot.

10. An injector-burner provided with an oilway terminating in a wide thin discharge-outlet, the floor of the discharge-outlet concaved, and a steamway adapted to impinge steam against the oil from said oilway, and a drip-guard extending above said ways and adapted to prevent the precipitation of water into the atomizing-oil.

11. An injector-burner comprising a body provided with an oilway terminating in two discharge slots or ducts, and with a steamway terminating in a thin wide discharge-outlet, one of said oil-discharge ducts communicating into the steam-discharge slot, the other duct discharging across the plane of discharge from said steam-discharge slot, said body provided at its front end with an upwardly-inclined drip-guard.

12. An injector-burner comprising a body having an oilway terminating in two discharge slots or ducts separated by a lip or partition forming the floor of the outward duct, said lip or partition having a concave upper face, the floor of the other duct also concaved, and said body provided with a steamway terminating in a discharge-slot adapted to impinge steam against the oil from said ducts, said body provided with a forwardly-extending upwardly-inclined drip-guard.

13. An injector-burner comprising a body provided with an oilway terminating in a wide, thin discharge-outlet, said body provided at its under side with a recess or cavity, a detachable plate secured on said body below said recess or cavity, said plate being recessed to form a steamway, said recess or cavity in the bottom face of said body forming an expansion-chamber, an inlet into said steamway, said inlet opening thereinto at an angle to the discharge from said steamway, and means for directing the oil from said oilway across the plane of discharge from said steamway.

14. An injector-burner comprising a body provided with an oilway terminating in a wide, concave bottom discharge-outlet, the under face of said body provided with a cavity, a recessed plate affixed to said body opposite said cavity and forming a steamway terminating in a wide steam-discharge slot, the recess in the bottom face of said body forming an expansion-chamber, and said body provided with an end block or end wall forming a downward extension of said oilway adapted to project the oil downwardly across the plane of the steam-discharge.

15. An injector-burner comprising a body provided with an oilway and two discharge slots or ducts, said oilway communicating directly into the primary discharge-duct and a plate superposed above said primary duct, and over which said way communicates into the secondary duct, and a steamway discharging across the plane of discharge of said ducts.

16. An injector-burner comprising a body provided with an oilway having a downwardly-expanded outer portion and two discharge ducts or slots, said oilway communicating directly into the primary discharge-duct, a plate or floor superposed above said primary duct in substantially the plane of the floor of the unexpanded portion of the oilway and over which said way communicates into the secondary duct, and a steamway discharging across the plane of discharge of said ducts.
